The Journal is to be put out to bid every 18 months and in February three printing establishments were contacted, only one of which is now preparing an estimate. The other two were not equipped to handle a book of this size. A fourth printing firm has just been contacted.

The Editorial Board did not favor a change in Journal format in order to cut costs and agreed that improved readership depends upon an attractive graphic presentation as well as content.

The Board agreed to hold three meetings a year from now on.

On Friday, April 3, 1970 the Board met to discuss the Membership Directory. The members agreed that the Directory is rarely used by them and it was decided that it will be published every other year and will be incorporated as an issue of the Journal rather than in its present book form. From time to time the Journal staff will prepare an errata, a list of changes and names of new members which will be published. Dr. Flotte is investigating the possibility of using the AMA's magnetic tape to facilitate production. Also under discussion is the possibility of incorporating the Board of Medical Examiner's list of newly licensed physicians in Maryland.

In September, the Editor and Managing Editor attended the State Medical Journal Advertising Bureau's biennual conference in Chicago. The Managing Editor is also scheduled to attend the American Society of Association Executives Publications Conference in Chicago in April 1970.

A new staff member, Mrs. Debby Anderson, joined the Journal as Assistant Editor in September 1969.

At the end of December, the term of Moses Paulson, MD, was completed and J. B. Zachary, MD, was appointed to his position on the Editorial Board.

The Journal is still receiving favorable comments and our circulation is increasing. And, according to the results of the Faculty survey, testing its facilities and services, the Journal is read second only to specialty journals by the membership.

Respectfully submitted,
C. Thomas Flotte, MD, *Editor*
Judy Sowell, *Managing Editor*
Debby Anderson, *Assistant Editor*

MED-CHI INSURANCE TRUST

Mr. President and Members of the House of Delegates:

The Med-Chi Insurance Trustees are continually striving to improve the various programs that are available to members of the Faculty through the Trust administration. The programs administered by the Trust are: (1) Accident and Sickness Disability Insurance (2) Major Medical Expense Insurance (3) Blue Cross and Blue Shield (4) Business Expense Disability Insurance (5) Life Insurance, and (6) Keogh Retirement Plan.

The *Accident and Sickness and Major Medical* programs, underwritten by the Hartford A and I Company, were liberalized effective November 1, 1969. The four main changes were to: increase Major Medical maximum benefit from $15,000 to $20,000; increase daily private room limit to $60 per day; increase coinsurance percentage from 80% to 90%; and free inclusion of

$10,000. Accidental Death and Dismemberment benefits on insured members plus $5,000 on spouse if no children, or $4,000 on spouse and $1,000 on each child. Rate reductions became effective November 1, 1969: under age 40—25% reduction, 40 to 49—15%, 50 to 59—10%, 60 and over—5%.

The *Major Medical and a five year accident—two year sickness disability* program will be available to employees of insured members in 1970.

The *Blue Cross and Blue Shield* group has been under study. Hopefully in 1970, insured members will be able to include their assistants in the Faculty group. Also, for a very nominal rate increase, the program can be changed to a 70-day plan with diagnostic coverage.

The *Business Expense Disability* program, underwritten by the St. Paul Insurance Company, has increased the limits of coverage from $1,000 a month to a maximum of $1,500 a month. This change will be announced in 1970.

The *Life Insurance* program, underwritten by the Minnesota Mutual Life Insurance Company, has grown in participation. Last year the subscribers were sent a 9% cash dividend. This year each participant will have the option of taking a cash dividend or having a higher dividend applied against the insurance premium. This program is also under study for possible improvements.

The *Med-Chi Members Retirement Plan* had a most successful year. As of December 31, 1969, there were 486 participants in the plan. The equity fund approximated $1,000,000. The fund enjoyed a 6.3% gain in value for the year, which is the best performance of all physician funds throughout the country. Significantly, the Dow Jones Industrial Average was down 11.6% for that same period.

We are happy to report this successful year of operation. It is our hope the programs will continue to receive the enthusiastic support of the membership.

Respectfully submitted,

PAUL F. GUERIN, MD, *Chairman*
HARRY J. CONNOLLY, MD
WILLIAM J. MCCLAFFERTY, MD
RICHARD F. MOSCHELL, MD

RICHARD A. YOUNG, MD

MEDIATION COMMITTEE

Mr. President and Members of the House of Delegates:

The Mediation Committee has held meetings at least once a month during the past year. In fact, the average, including various subcommittee meetings, would exceed this ratio. There seems to be an increasing number of knotty problems being presented to the committee for solution, with more and more appeals being heard from decisions made on a local level.

The committee has developed guidelines for use by component societies in the handling of grievances and, hopefully, these are of some assistance in handling the cases expeditiously and thoughtfully, and in resolving the problems.

A total summary of cases handled locally and on the state level is attached to this report.

During the past year, activities of the committee have resulted in the voluntary surrender of licenses to practice medicine and surgery by three physicians; and the committee has recommended stronger measures to the Commission on Medical Discipline for four other cases presently pending before the commission.

All physicians involved in the so-called Medicaid scandal of Baltimore city have been interviewed with the exception of two physicians who have elected to take their cases to trial in court. No decision has been rendered by the committee with respect to these cases, pending the outcome of the trial of the pharmacist involved and the two physicians whose cases were still pending trial at the time of the 1970 Annual Session.

During the year, cases other than disputes between patients and physicians that were heard and settled by the committee included:

1. Clarification of the practice of a hospital charging a percentage of the sums collected for physician's services rendered in that institution. Such a practice is unethical.
2. Referred to the Board of Medical Examiners instances that have come to light in which unauthorized persons have been practicing medicine.
3. Clarification of rental of office space to a group of physicians on a percentage basis, which is unethical.
4. Denied in some instances and granted in others, exceptions to the Faculty's policy with respect to Yellow Pages telephone listings.
5. Recommended various policy matters to Council for approval.
6. Conducted a study of the number of abortions performed during the six months of the revised law dealing with therapeutic abortions (July through December 1968).
7. Misuse of a physician's Blue Cross symbol.
8. Developed a policy with respect to hospital solicitation of patients for research projects.
9. Determined that a physician should itemize his bill to assist his patient in collecting Medicare benefits.
10. Reviewed Faculty policy with respect to hospital privileges for podiatrists and recommended a change in this to the House of Delegates.
11. Determined that distribution of a list of "Guild Opticians" by ophthalmologists was not in violation of ethics.
12. Adopted a policy of nondiscrimination with respect to acceptance of patients by physicians.

The committee is gravely concerned over the practice of some institutions which openly solicit patients, a practice which physicians are prohibited by law from doing. The committee currently has under consideration disciplinary action against physicians who are directly or indirectly associated with institutions that so solicit. It is self-evident that a physician must be guided by ethical and legal regulations, and that benefiting from solicitation conducted by an organization is as much a violation as if he made such solicitation himself.

In response to newspaper reports that Maryland was becoming an "abortion mill", a subcommittee composed of Drs. Reese, Linhardt, Sullivan, Cushner, and Mr. King was named to obtain statistical information on the first six months of operation under the abortion statute that took effect on July 1, 1968.

The results indicated that the newspaper statements were inaccurate and that less than 10% of the therapeutic abortions performed in Maryland were on out-of-state residents.

The Subcommittee on Narcotic Prescribing Practices of Physicians continued in existence and met with physicians whose prescribing practices of controlled drugs was brought to their attention. This has resulted in cutting short what might turn into illegal or unethical practices by physicians.

This subcommittee also has met and continued to monitor the Methadone Blockage programs in the state. It will continue to act as liaison for the committee in this area. Its members are Drs. Louis J. Kolodner,

Chairman, and J. Morris Reese, John B. De Hoff, Henry C. Mellette and Stephen A. Hirsch.

Until the formation of the Peer Review Committee, a subcommittee on Utilization Review has been active in reviewing questionable practices by physicians in the Medicare and Medicaid programs. In all cases brought to the attention of the subcommittee for consideration, a satisfactory resolution of the problem was reached. Subcommittee members included Drs. Robert B. Goldstein, Katherine H. Borkovich, and Worth B. Daniels, Jr.

On the advice of legal counsel, the committee is now proceeding to hear cases in which physicians are charged, under the law, with violations of various statutes. Previously, it has been the practice to wait until the courts had disposed of these matters. Sometimes it took years. It is hoped that speedy disposition of such matters will effectively show the public and the courts that the profession is anxious and willing to discipline wrongdoers within the profession.

During the past year, there have been several instances in which physicians have been openly dispensing or prescribing controlled drugs without there being any medical indication for them. As information is brought to the committee, the individual physician is called in for an interview. To date, there has been no problem in persuading the physician to cease such practices.

The Faculty considered a total of 66 cases of unethical activity on the part of physicians. Of this total, 44 cases were resolved; 12 cases were referred to the Board of Medical Examiners; and 10 cases were still pending as of December 31, 1969.

MEDICAL ECONOMICS COMMITTEE

Mr. President and Members of the House of Delegates:

Five meetings of this committee were held during the year. The majority of the time was spent in adjudicating what are usual or customary fees for which insurance carriers are liable under their major medical policies. Nearly all problems were solved satisfactorily.

Educational endeavors, with respect to pitfalls for malpractice insurance cases, were continued. During the year, your chairman and Faculty legal counsel spoke at ten meetings of hospital staffs throughout the state. This is a worthwhile endeavor and one that will be continued as time and availability of speakers warrants.

One instance in which a carrier refused to pay out-of-hospital benefits under his policy when he would have paid for the same service if it were performed in a hospital was discussed. It was the consensus of the committee that this is bad practice and only points up the problems associated with the hard and fast rule that some insurance carriers follow in interpretation of the policy benefits. The committee is of the opinion that this can only increase total costs to the carriers, the public and government. Despite a meeting with representatives of the local Health Insurance Council, no headway was made in this regard.

The committee also discussed questions that are being raised about Blue Shield by some nonparticipating physicians. Under Blue Shield's usual, customary, and reasonable payment schedule for Plan C, a determination is being made by BS as to what the physician's charge shall be. The committee also finds this reprehensible and is currently discussing this matter with Blue Shield so as to prevent misunderstandings both by the patient and the physician.

As are all physicians, the committee is concerned over the continued increase in professional liability insurance premiums. Discussion is taking place looking toward some alternatives. When and if a proposal is available, it will be presented to the appropriate governing body of the Faculty for its consideration.

Respectfully submitted,

W. Kenneth Mansfield, MD, *Chairman*
Fred N. Cole, Jr., MD
Thomas Crawford, MD
Alfred S. Norton, MD
Samuel H. Bryant, DDS

MEDICAL TISSUE DONATION COMMITTEE

Mr. President and Members of the House of Delegates:

Recognizing the possibility of uniformity in donor cards and also the practicality of coordinating efforts in this area, the Faculty sponsored this committee. Representatives, as indicated at the conclusion of this report, attended the seven meetings of this group.

Those responsible agreed to a telephone listing under which a person at a central telephone would obtain names and addresses of individuals who were interested in donating any or all of their organs or entire bodies after death. A central registry was considered desirable and one was established on a trial basis.

In cooperation with the Attorney General's office, a form was developed and limited supplies were printed. It has since been ascertained that the form is confusing to those filling in the essential information and that it should be revised.

There is a serious question as to the advisability of continuing the central operation and telephone listing. This will be considered at a future meeting of those involved and a conclusion will be reached.

This group is cited as one example where the Faculty acts as a leader and a catalyst to get the interested groups working together toward a common goal.

Respectfully submitted,

William Snyder

MEDICOLEGAL COMMITTEE

Mr. President and Members of the House of Delegates:

At the Semiannual Session in September 1969 the term of office for this committee was changed to coincide with the presidential year of the Maryland State Bar Association. This report, however, covers only the Faculty presidential year, even though the term of office of committee members will be through July 1970.

As is the custom, various subcommittees took under consideration specific areas of concern as defined by their titles. The subcommittee activity was as follows:

Subcommittee on Interprofessional Relations

This subcommittee met on three occasions to discuss complaints made by physicians against attorneys, and by attorneys against physicians. Most of these have been settled on a relatively amicable basis. As recommended by the subcommittee and by the Medicolegal Committee, an amendment to the Medicolegal Code of Cooperation has now been approved by both the Bar Associations and the Faculty. This new provision should make it clear as to who is responsible for payment of fees for reports and other information supplied to attorneys, as distinct from charges for medical services to the patient.

This constituted the bulk of the complaints handled in this subcommittee.

Symposia Subcommittee

This subcommittee arranged for a panel to discuss "Psychiatric Relationship to Trauma" for the annual mid-winter meeting of the State Bar Association.

No similar program was arranged for physicians.

The Medicolegal Committee declined to approve a medical release and assignment form that was developed in the Subcommittee on Interprofessional Relations.

NOMINATING COMMITTEE

Mr. President and Members of the House of Delegates:

The following names are being presented for your consideration for election to office. Those elected will assume office at conclusion of the Annual Meeting 1971, unless otherwise indicated.

President-elect

John F. Schaefer, MD, Baltimore — President-elect 1970-71; President 1971-72

First Vice President
Raymond M. Yow, MD, Salisbury (1972)

Second Vice President
John H. Hornbaker, MD, Hagerstown (1972)

Third Vice President
Louis J. Kolodner, MD, Baltimore (1972)

Secretary
William A. Pillsbury, MD, Timonium (1972)

Treasurer
Karl F. Mech, MD, Baltimore (1972)

Councilors

Central District
John T. Chissell, MD, Baltimore (1974)
John M. Dennis, MD, Baltimore (1974)
J. Morris Reese, MD, Lutherville (1974)
James B. Brooks, MD, Baltimore (1974)
Philip H. Heuman, MD, Bel Air (1974)

South Central District
John G. Ball, MD, Bethesda (1974)
Wolcott L. Etienne, MD, College Park (1974)
Seruch T. Kimble, MD, Silver Spring (1974)

Eastern District
Francis J. Townsend, MD, Ocean City (1974)

Southern District
J. Parran Jarboe, MD, La Plata (1974)

Delegate to the American Medical Association
Charles F. O'Donnell, MD, Towson (Jan. 1, 1971-Dec. 31, 1973)

Alternate Delegate to the American Medical Association
Arthur E. Cocco, MD, Baltimore (Jan. 1, 1971-Dec. 31, 1973)

Committee on Program and Arrangements
Albert M. Antlitz, MD, Baltimore (1970-74)
J. Donald Drinkard, MD, Towson (1971-75)

Library and History Committee
Harold H. Gist, MD, Hagerstown (1970-71)
Thomas C. Hill, MD, Salisbury (1971-76)

Finney Fund Committee
William H. M. Finney, MD, Baltimore (1976)

Board of Medical Examiners
William L. Stewart, MD, Westminster (June 1970-June 1974)
Elmer G. Linhardt, MD, Annapolis (June 1970-June 1974)

Respectfully submitted,
ARTHUR G. SIWINSKI, MD, Baltimore, *Chairman*
ELMER G. LINHARDT, MD, Annapolis, *Southern District*
PHILIP W. HEUMAN, MD, Bel Air, *Central District*
ROBERT W. FARR, MD, Chestertown, *Eastern District*
CHARLES C. SPENCER, MD, Hagerstown, *Western District*
WILLIAM A. HOLBROOK, JR., MD, College Park, *South Central District*
CLAUDE D. HILL, MD, Baltimore, *Member-at-Large*

OCCUPATIONAL AND ENVIRONMENTAL HEALTH COMMITTEE

Mr. President and Members of the House of Delegates:

Two meetings were held by this committee—the scope and responsibilities of which were broadened by action of the House of Delegates at the Semiannual Session. Two new members were added to the committee, one a representative of the Faculty's Traffic Safety Subcommittee, for the purpose of coordinating efforts of committees with similar charges. It is believed that further expansion of the committee may be desirable.

The assistance of this committee was offered to the Secretary of Health and Mental Hygiene in matters concerning environmental health of the community.

The Governor's Award to a Physician for Promotion of Employment of the Handicapped was awarded to Isadore B. Lyon, MD, of Washington County, whose nomination was made directly to the Governor's Committee. Since this committee had nominated Lomax Wells, MD, a special award was made to him by the Governor's Committee in view of the fact that he serves on the President's Committee and would be ineligible for the original award. A letter was addressed to the Governor's Committee indicating that future nominations would be made through the Faculty, rather than through the component societies.

Mr. Howard Chaney, Director of the Bureau of Consumer Protection, Department of Health and Mental Hygiene, was a guest at one meeting and explained the functions of his department.

Note was made of the air pollution programs being conducted by George Washington University Medical Center and prepared for television presentation. If the programs are aired in Baltimore, names of physicians to participate will be given to the television studio if requested.

State and federal legislation was discussed briefly.

Respectfully submitted,
HAROLD P. BIEHL, MD, *Chairman*
JOHN R. DAVIS, MD
WALTER E. FLEISCHER, MD
DONALD J. ROOP, MD
EDWARD WITOWSKI, MD
FRANCISCO G. JAPZON, MD

POLICY AND PLANNING COMMITTEE

Mr. President and Members of the House of Delegates:

Several items were discussed during the past presidential year. The question of utilization review, rereferred to the committee by the House of Delegates at the 1969 Annual Session, was reconsidered and a proposed Bylaw amendment was submitted for approval of the House at the 1970 Annual Session. This amendment was drafted by the Bylaws Committee, on recommendation of the Faculty's Council.

A survey of Faculty membership to ascertain what is known about Faculty services and benefits was recommended and approved. This has been conducted and the responses are currently being tabulated.

Other items discussed within the committee, but with no positive action being taken at this time, included a study of the health manpower (physician) shortage in Maryland; a study to combine all medical society controlled scholarship and loan programs; a study regarding a proposed Division of Research and Planning within the Faculty; a study on a data processing system for Faculty membership records; and the financial responsibility for benefits accruing to all physicians in Maryland whether or not such persons are Faculty members.

At the time of this writing, an in-depth consideration of the AMA Committee on Long Range Planning report is scheduled for early in the next presidential year. This study will be reported to the Council for its consideration and action.

Respectfully submitted,

ARTHUR T. KEEFE, MD, *Chairman*
MANNING W. ALDEN, MD
CHARLES BAGLEY, III, MD
J. TYLER BAKER, MD

JOHN SMITH, MD

COMMITTEE ON POSTGRADUATE EDUCATION, PREVENTIVE MEDICINE AND PUBLIC HEALTH

Mr. President and Members of the House of Delegates:

This committee, with its interested progressive members and subcommittees, has met every other month and many worthwhile projects have been pursued. A representative from the Faculty's Committee on Emotional Health and one from the Regional Medical Program have continued to serve on the committee and have brought much valuable information to the meetings.

A suggestion was received by the committee regarding an opinion on dividing it into two committees, since its charge, as set forth in the Bylaws, is so extensive. The matter was considered and it was unanimously agreed that since the committee's primary responsibility is to coordinate the activities of its many subcommittees, such a division would not be practical because of the overlapping of the various functions covered by this threefold committee. A letter was sent to the Bylaws Committee to this effect.

The representative from the Regional Medical Program reported at each meeting on the projects that have been funded in Maryland and on the position of hospital directors of medical education that have been appointed or are being considered. Continuing education seminars have been held by the RMP with emphasis placed on directors of continuing medical education. Meetings have been held with the chairman of the MEDIC Subcommittee to discuss the possibility of the network being used by the RMP. No decision has been reached to date.

Several activities of the Emotional Health Committee were reported, among which was the lack of facilities in Maryland for emotionally disturbed children and adolescents. The Child Welfare Subcommittee and this parent committee are extremely concerned about this situation. The problem is under intensive study by the Emotional Health Committee. Also, a decision was made not to recommend a change in the Guidelines for Therapeutic Abortion to the effect that all pregnant girls 15 years of age and under should be given a psychiatric evaluation.

In November 1969, a Viral Symposium was held in the Faculty building, cosponsored by the Faculty and the National Communicable Disease Center. This was an all-day program with nationally prominent speakers. The attendance, practically all physicians, was over 100. The program was excellent and there was good audience attention.

Although there is no longer a Speakers Bureau under this committee, three requests were filled for speakers for component medical society meetings.

Resolutions on the hazards of smoking were received from the State Board of Education requesting that the Faculty do whatever possible toward the implementation of these resolutions. An ad hoc committee, after due consideration, drew up a resolution and statement that was recommended to the Executive Committee and approved as Faculty policy.

The Maryland Chapter of the American Cancer Society indicated it would like to have some liaison with the Medical and Chirurgical Faculty on its Professional Education Committee. Since there is no longer a Cancer Subcommittee and because the activities of the Regional Medical Program in the area of cancer and the interest of this committee are similar, it was agreed that the representative from the Regional Medical Program on this committee serve as a liaison.

Both the Cancer and Diabetes Subcommittees were discontinued as it was agreed that having subcommittees for individual diseases could lead to an unlimited number

and become most cumbersome. Any problems regarding specific diseases will be considered by this parent committee. The Medical and Chirurgical Faculty has endorsed an annual Diabetes Detection Drive with the understanding that local components would be free to implement this as they wished.

Subcommittee on Airport Medicine

No actions have been taken on the status of the medical facilities at Friendship Airport by this subcommittee, due to the uncertainty of its sale to the state by the City of Baltimore. However, the latest information is that there is to be a combined ownership. At present, there are 3,000,000 passengers a year who pass through the airport and it is expected there will be 9,000,000 by 1980. These figures do not include visitors and personnel of the airlines. There is a definite need for adequate medical facilities. It is hoped in the near future, when the ownership is settled, that the Faculty will make a recommendation regarding the necessary medical facilities.

Consideration has been given to the large number of fatalities in small plane accidents where alcohol has been involved. The FAA is very active in reviewing this problem and it is recognized that there are undoubtedly a great many nonfatal accidents due to alcohol. It was felt this problem involved three subcommittees: Airport Medicine, Alcoholism, and Traffic Safety. Each of the subcommittees is studying the matter, and a letter will be sent to the FAA with recommendations.

Subcommittee on Alcoholism

Several programs have been presented over the MEDIC Network under the auspices of this subcommittee. A motion was passed that the Faculty urge the Baltimore Area Council on Alcoholism to have a knowledgeable physician present at gatherings, where alcoholism is the main topic, to fully present the concept that alcoholism is a disease. Members of the subcommittee have participated in staff and other hospital and medically oriented meetings to discuss the problem and treatment of alcoholism. It is felt there has finally been a real break-through in reaching the general hospitals regarding the treatment of alcoholism. Through the efforts of a member of this subcommittee and others, there is now an ambulance service for mentally disturbed patients, including alcoholics, in Baltimore city.

A member from the Council on Mental Health of the AMA attended one of the subcommittee meetings and was greatly impressed by the progressive activities and advances that have been made in Maryland in the treatment of alcoholism, and noted that this state could well serve as a model for other states.

The subcommittee recommended support of an increase over last year in the Governor's budget for funds earmarked for alcoholism programs. Also, it has recommended that private rehabilitation units be licensed in order to have payment included in Blue Cross/Blue Shield.

Joint Anesthesia Study Subcommittee

A request was received some time ago that a Joint Anesthesia Study Committee be established on a statewide basis. There has been one in Baltimore city for several years and it has proven quite worthwhile. A chairman was appointed and sent letters regarding willingness to furnish necessary information for a study committee to all hospitals in Maryland, excluding Baltimore city, Prince George's and Montgomery counties. In view of the limited number of affirmative replies received regarding the submission of necessary information and that from experience in this area it was felt only 50% of those would cooperate, it was decided that for the moment such a subcommittee not be established. However, the programs for the city committee meetings are sent throughout the state and can be heard over MEDIC. If anything further develops in this matter, the appointment of a subcommittee will be reconsidered.

Child Welfare Subcommittee

Council approval was received for this subcommittee to look into a program for hearing and vision screening of preschool children in Maryland. This would be similar to the program in Minnesota which has received wide publicity throughout the country. An ad hoc committee was appointed and received approval of a program in Maryland from the Maryland ENT Society, the Maryland Ophthalmological Society, and the Maryland Chapter of the Academy of Pediatrics. The ad hoc committee was composed of representatives from the Academy of Pediatrics, Maryland Society for the Prevention of Blindness, the ENT Society, Health Departments, and several audiologists. After numerous meetings and an in-depth study of all the many phases of such a program, which would be conducted primarily by volunteers, it was agreed that a nonprofit organization be formed with a Board of Directors consisting of four members appointed by the Faculty and three members appointed by the Society for the Prevention of Blindness. Limited seed funds are being made available from the money left from the Mass Measles Campaign in 1968. Definite plans are now being made for the formation of a nonprofit organization and the program no longer will be under the Child Welfare Subcommittee. This organization will be called HAVES (Hearing and Vision Early Screening).

The controversial sex education program in the schools in Maryland was studied, and after careful consideration a proposed policy was recommended. Council approval was received and a Faculty policy statement was formulated.

The state-wide immunization program for rubella was given much study by the Steering Committee on Immunization Projects, composed of the members of the Child Welfare Subcommittee and representatives of the health departments. Guidelines were established, which have been adopted by the National Communicable Disease Center and are being used throughout the country. Also being studied by this Steering Committee is a uniform immunization schedule for children in Maryland. At present the State Health Department, City Health Department, and Academy of Pediatrics each has a different recommended schedule.

Subcommittee on Chronic Respiratory Diseases

A successful seminar, cosponsored by the Medical and Chirurgical Faculty, the Maryland Academy of General Practice, and the Maryland Tuberculosis Association was held. Taken under study was the question of who, other than physicians, could do tuberculin testing. An opinion was received from the Nursing Liaison Subcommittee of the Faculty to the effect that registered nurses and licensed practical nurses could perform this procedure, but that unlicensed lay technicians should not be permitted to function in this manner. This opinion was forwarded to the City and State Health Departments and to the Maryland TB Association. It was also noted that since the closing of the TB Division of the Baltimore City Hospitals there has been a greater problem than ever in the follow-up of tuberculosis patients.

Subcommittee on Maternal Welfare

This subcommittee, as well as the Emotional Health Committee, considered the proposed change in the Guidelines for Therapeutic Abortion to the effect that all pregnant girls 15 years of age and under be given a psychiatric evaluation. After much discussion and after referral to Council, it was agreed that there should not be any changes made in the Guidelines for the present.

The subcommittee members endorsed and testified in favor of the bill now in the State Legislature abolishing the law regarding therapeutic abortion, leaving the decision to the woman and her physician. However, it is felt that there must be some control of possible unethical procedures and this should be by the Commission on Medical Discipline.

The reporting form for hospitals on perinatal mortality was reviewed and recommendations made. The subcommittee endorsed the concept of a course in sex education and family life being taught in the public schools, subject to review by appropriate authorities. As stated in the Child Welfare Subcommittee report, this was incorporated in a Faculty policy statement.

Council approval was received to send a letter to Maryland hospitals asking them to send in case reports on perinatal deaths. Many case reports have been received and these are being processed by the Health Departments and the Ad Hoc Committee on Perinatal Mortality which is under this subcommittee.

Subcommittee on Continuing Medical Education (MEDIC)

An educational program was scheduled for the 1969-1970 year over MEDIC. There is an increasing interest in the network with it being used as part of Baltimore City's National Disaster Plan, Perinatal Conferences, Legislative Committee meetings, broadcasting of the meetings of the city's Joint Anesthesia Study Committee, and calls from hospitals and individual physicians to the Faculty library. There are regular pediatric and medical grand rounds broadcast, as well as weekly replays of the programs presented each Friday.

Members of the Faculty were notified of the opportunity to have a MEDIC speaker installed in their offices, and several have done so. The Regional Medical Program is looking into the possibility of sharing the use of the network. The members of the Maryland Chapter of the Academy of General Practice use MEDIC as a source of credits. The subcommittee passed a motion, which was approved by the Postgraduate Committee, to make an effort to persuade hospitals to give credit for listening to scientific MEDIC programs in lieu of attending staff departmental meetings.

Approval is requested by the House of Delegates on the following recommendation, which was approved by the Postgraduate Committee:

That the MEDIC Network be continued and that such funds be appropriated to the extent needed to finance the operation of the system for a five-year period in order to produce stability and enable proper planning of programs of desired quality. If this action is not deemed acceptable for a five-year period, it is recommended that said funds be made available for the year 1970-71, during which time other sources of maintenance will be sought.

Subcommittee on the Medical Aspects of Sports

Three ad hoc committees were appointed for the purpose of (a) setting up guidelines for follow-up care of abnormalities found on sports physicals, (b) to study the concept of a central registry for reporting sports injuries, and (c) to outline sports trainers curriculum for community colleges. A form for the follow-up procedure for participation in sports was drawn up, received approval by the Faculty and State Board of Education, and is being used as a pilot study in some areas of the State.

A curriculum for sports trainers was drawn up and, after receiving Faculty approval, is now in effect at the Catonsville Community College. The problem of a central registry for reporting sports injuries in the secondary schools is still under study.

The third annual Seminar on the Medical Aspects of Sports, cosponsored by the Faculty and the Catonsville Community College, was held in December 1969. This was most successful and completely self-supporting. A similar seminar is now being planned for December 1970.

Subcommittee on Traffic Safety

The Governor's Safety Legislation Package for the 1969 State Legislature was passed, which included the expressed consent law. This subcommittee was very active in having this legislation enacted. In the 1970 State Legislature, a bill has been introduced to the effect that a statement be included on license renewals about willingness to take a breathalyzer test. This subcommittee has reviewed the proposed bills regarding traffic safety being introduced in the current session of Legislature, and has made appropriate recommendations for support by the Faculty.

An issue of the *Maryland State Medical Journal* in the near future will be devoted to traffic safety. The Bylaws of the Faculty changed the charge to the Occupational Health Committee to include environmental health. At the request of the chairman of that committee, a representative of the Traffic Safety Subcommittee was appointed to serve as a liaison representative on the former committee.

There will be one more meeting of the Committee on Postgraduate Education, Preventive Medicine, and Public Health between the writing of this report and the meeting of the House of Delegates. Actions taken at that time will be included in the next annual report.

* * *

This large committee with its many active productive subcommittees has accomplished much during the past year, both for the profession and for the public. I take this opportunity to express my sincere appreciation to the chairman of each subcommittee and its members for their many hours and efforts devoted to making this a successful year for our committee.

PROFESSIONAL MEDICAL SERVICES COMMITTEE

Mr. President and Members of the House of Delegates:

This committee is still involved in determining whether or not fee schedules should be developed and publicized or the present policy of the Faculty that this not be done should be continued. A recommendation has been made to the Council suggesting that data be obtained and filed in the Faculty office for reference purposes, but this was rejected by the Council.

Discussions have taken place periodically with Blue Shield representatives about the forms in use through

Medicare. As a result of these discussions, modifications were made in The Explanation of Benefits for Medicare Beneficiaries form.

The committee has started to give consideration to methods of delivery of health care services.

Also considered by the committee were fee payment schedules under Medicaid and the status of the Revision of Workmen's Compensation Schedule.

COMMITTEE ON PROGRAM AND ARRANGEMENTS

Mr. President and Members of the House of Delegates:

The registration at the 1969 Annual Meeting was the highest of any meeting of the Faculty, 1,508, of which 880 were physicians including 65 residents and interns. All scientific sessions were very well attended and many favorable comments were received about the high quality of the program. Again, an excellent report was given by the Medical Exhibitors Association, and the few complaints from the exhibitors were minor. The Health Evaluation program was held for the sixth consecutive year and 590 persons took the tests. This feature of the Annual Meeting continues to be well patronized by many members taking advantage of this opportunity provided by their fellow members.

The 1969 Semiannual Meeting was held at the Hotel Hershey in Hershey, Pennsylvania and proved most successful. While the actual registration was not as high as at some of the previous Semiannual Meetings, the attendance at the scientific sessions and social functions was much greater. Many favorable comments were heard about the facilities at the Hotel. The Woman's Auxiliary cooperated by arranging a "Surprise Fun Night". Members of the Faculty, their wives, and families participated.

Plans and arrangements for the 1970 Annual Meeting are complete. It is felt an outstanding program, with prominent out-of-state speakers, has been scheduled. The medical and surgical grand rounds, which have proven so popular for the past few years, have again been included in the program. All available technical exhibit space has been sold and the income from this will be slightly higher than in 1969. However, it is practically certain expenses involved with the meeting will be higher due to the general economic conditions. The response for scientific exhibit space was very good and some applications were not accepted due to limited facilities in the meeting hall. All scientific exhibits are from Maryland physicians.

An innovation this year will be an Art and Hobby Exhibit, sponsored by the Medical and Chirurgical Faculty and the Woman's Auxiliary. Also, the Faculty is cooperating with the Auxiliary in sponsoring an International Night.

The annual Presidential Reception and Banquet will be held at the Blue Crest North with dancing during and after dinner. A Hospitality Night, which was held for the first time in 1969, will again be held this year with all members and their wives invited as guests of the Faculty. At the annual Round Table Luncheon this year, in addition to the usual scientific subjects discussed, there will be meetings of seven medical alumni groups. The response to the latter already has been very good. The Health Evaluation Tests will again be available for those attending the Annual Meeting. The many procedures and details connected with this valuable benefit of membership in the Faculty are being developed and carried out by a subcommittee composed of members of the Faculty and paramedical groups.

Our committee extends its appreciation to the many members of the Faculty, the Woman's Auxiliary, and Faculty staff for their able assistance and cooperation in planning and carrying out the plans for the Annual and Semiannual Meetings. To all who have volunteered so many hours for arranging and processing the Health Evaluation Tests we wish to express our special thanks.

RICHARD R. CRANE
GORDON WEHRLE

PUBLIC RELATIONS COMMITTEE

Mr. President and Members of the House of Delegates:

Three sessions of this committee were held during the year. Items discussed included health manpower and the shortages existing in this area; school health councils on a state and local level; public speaking seminars; medical assistant seminars; foreign interpreters for patients, and many other subjects.

A seminar on public speaking was scheduled for the next presidential year and is similar in content and approach to other, previously held seminars. These have been extremely successful and no doubt this one planned will be as well.

The Woman's Auxiliary has cooperated wholeheartedly with the committee in setting up a list of foreign interpreters for use of patients who can speak no English. This is being constantly updated, and is available through all hospitals in Maryland, as well as the Faculty office and other sources.

The Citizen Award Program was recommended and adopted by the Council. This is a mechanism to recognize lay persons who contribute much to the health of individuals and the community. To date, three awards have been made through component medical societies —three more are being prepared. This has resulted in favorable publicity being given to those individuals

receiving the awards, as well as to the medical profession on a local and state level.

The committee is constantly being made aware of "unfavorable" newspaper publicity, over which very little influence can be exercised. With this in mind, it was felt that a concentrated effort should be made to bring to the public's attention the positive things the Faculty is doing and has done.

The committee recommended to the Council employment of a public relations consultant for the Semi-annual and Annual Sessions. This was approved. However, a disappointing amount of publicity was obtained at both of these meetings. The committee will again reconsider this problem and attempt to find some solutions, if there are any.

This year the medical assistant seminars, so successful in the past, have been scheduled through the state so as to make it easier for office assistants to attend. One was held in Hagerstown for the Western part of the state; and another in Salisbury for the Eastern Shore. Additional sessions are planned for the Metropolitan Baltimore area and for the South-Central and Southern districts.

Still under active consideration is a joint venture with the Hospital Council, Dental, Pharmaceutical and other groups for preparation of pamphlets that would be distributed by all groups. Such a pamphlet would involve the entire gamut of health care costs and attempts to explain the reasons for the cost of quality health care. This will be pursued further during the next presidential year.

In closing, it is pointed out that the best public relations efforts are those put forth by physicians, their wives, their office assistants, and related persons, in their everyday lives. It is important that positive efforts be made with the communications media, but all of the favorable publicity in the world cannot undo the hard feelings that inept handling of patients creates.

REFERENCE COMMITTEE

Mr. President and Members of the House of Delegates:

The Reference Committee met on Thursday, February 26, 1970 and considered the three resolutions which had been submitted. Those members of the Faculty who had an interest in these resolutions were present, and a thorough discussion was conducted. After due consideration, the committee makes the following recommendations:

Resolution 1A/70

Submitted: August 12, 1969
Introduced by: 31 members of the Baltimore City Medical Society
Subject: Provision of Ambulatory Diagnostic Benefits by Insurance Carriers, either in the hospital or private office

Whereas, Medical diagnosis is an integral part of the practice of medicine and diagnostic services are physicians' services; and

Whereas, The provision of the so called "pre-admission testing" by Blue Cross Plans involves provision of diagnostic medical services to ambulatory patients; and

Whereas, Provision of pre-admission testing under Maryland hospital care insurance limits the site of service to the hospital; and

Whereas, These restrictions inhibit attending physicians in selecting where and to whom to refer patients for these medical services and does not allow patients freedom of choice; and

Whereas, These restrictions discriminate against the independent practice of Radiology by Radiologists in private offices; and

Whereas, Ambulatory diagnostic benefits are desired by patients, have been recommended by spokesmen for government, labor and management, and will be made available through pre-payment; therefore be it

Resolved, That the Medical and Chirurgical Faculty of Maryland requests and urges Blue Shield/Blue Cross Plans and other insurers of physicians' services to extend ambulatory PRE-ADMISSION TESTING, diagnostic benefits so that they may be performed by PHYSICIANS RECOGNIZED AS QUALIFIED BY THE MEDICAL STAFF OF THE HOSPITAL TO WHICH THE PATIENT EXPECTS TO BE ADMITTED, either in the hospital or private office.

(CAPS PORTIONS ARE ADDITIONS)

This resolution deals with the use of private physician facilities in the provision of Preadmission Testing, *diagnostic studies* whenever possible, rather than using hospital facilities, either as an inpatient or outpatient.

The reasons given in the Whereas portions of the resolution are self-explanatory. There would appear to be no cogent reasons for rejection of this proposed resolution and your Reference Committee recommends its adoption as amended and agreed to by the sponsors.

Resolution 2A/70

Submitted: February 4, 1970
Introduced by: 31 members of the Baltimore City Medical Society
Subject: Urging the Medical and Chirurgical Faculty to recommend to Boards of Trustees and Medical Executive Committees of all Maryland hospitals to take action to discontinue the sale of cigarettes and tobacco in their respective institutions

Whereas, Cigarette smoking cannot be shown to be harmless to anyone, and has been shown to cause an annual mortality of about 300,000 primarily due to pulmonary and cardiac diseases; and

Whereas, The sale of cigarettes through machines and other sources by hospitals could be construed as a disclaimer to the health hazards of smoking; and

Whereas, Such sales by hospitals present difficulties in explaining to patients the harmful effects of tobacco smoking and also present difficulties in encouraging patients to stop this harmful habit; and

Whereas, It is incongruous for hospitals to participate in the sale of cigarettes and indirectly receive revenue from this source while at the same time treating victims of such harmful habits who have lung cancer, pulmonary emphysema and heart disease; and

Whereas, The restricting of such sales of cigarettes by hospitals would be in the best interest of the patients and the public; and

Whereas, The amount of revenue lost by hospitals if such sales of tobacco were stopped would be more than compensated for by the prolongation of life and promotion of healthful living; and

Whereas, The adoption of this resolution presents

no interference with an individual's freedom to do as he wishes, but removes the connotation that hospitals tacitly condone smoking; therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland strongly recommends to Boards of Trustees and Medical Executive Committees of all hospitals in Maryland that they take action to discontinue the sale of cigarettes and tobacco in their respective institutions; and

Resolved, That a copy of this resolution be sent to the Medical Executive Committees and Boards of Trustees of all hospitals in Maryland with the request that they consider adopting the action recommended herein.

This resolution is similar to the policy adopted by many organizations, including the American Medical Association. In addition, the Faculty itself recently adopted a policy statement on the use of tobacco, suggesting that individual physicians discourage people from using tobacco in any form.

Your Reference Committee finds this resolution worthwhile and recommends its adoption and implementation of the Resolved portions.

Resolution 3A/70

Submitted: February 4, 1970

Introduced by: Garrett County Medical Society

Subject: Endorsing the purpose and intent of Article 43-B, establishing the Comprehensive Drug Abuse Control and Rehabilitation Act, and urging implementation and execution of the provisions thereof

Whereas, By Chapter 404 of the Laws of Maryland, 1969, adding a new Article 43-B to the Annotated Code of Maryland, titled "Comprehensive Drug Abuse Control and Rehabilitation Act", the Maryland Legislature created a statutory authority to combat the effects of drug abuse through a statewide program of education, treatment and rehabilitation and for treatment of persons who have become addicts; and

Whereas, This program has not been implemented or executed because of a lack of adequate funds; and

Whereas, THE IMPLEMENTATION OF THIS STATUTE MAY BE CRUCIAL TO CURB the growing problem of drug abuse; now therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland endorse the purpose and intent of Article 43-B and of comprehensive drug abuse control and urge implementation and execution of the provisions thereof by the Legislature.

(CAPS PORTIONS ARE ADDITIONS)

At the time of the Reference Committee hearing, it was not possible to determine the status of the Governor's Budget which includes the sum of $772,435 and provides for a staff of 45 persons in addition to the three members of the authority. However, there is no reason to believe that the State Legislature will reduce this proposed budget. We believe the Governor and the Administration is attempting to implement the Drug Abuse Authority as provided for in the law mentioned in this resolution.

Your Reference Committee recommends adoption of this resolution as amended.

The Chairman wishes to express thanks to the members of the committee who were present and also those members of the Faculty who attended the meeting to present their views in regard to these resolutions.

Respectfully submitted,
Herbert H. Leighton, MD, *Chairman*
Melvin B. Davis, MD
Marvin I. Mones, MD
William L. Mosberg, MD
Raymond M. Yow, MD

SPECIAL COMMITTEES

Ad Hoc Committee on Admission of Patients to Coronary and Intensive Care Units

Mr. President and Members of the House of Delegates:

This ad hoc committee was named by the Executive Committee in late 1968. It held several meetings and made recommendations which were adopted in June 1969.

The recommendations outline guidelines for use of physicians in coronary care units and intensive care units.

Respectfully submitted,
Hilary T. O'Herlihy, MD, *Chairman*
William H. Mosberg, MD
Frank T. Kasik, MD

Advisory Council on Human Trials

Mr. President and Members of the House of Delegates:

This special group was named by the Executive Committee in January 1970 for the purpose of consulting with the Department of Health and Mental Hygiene and other state agencies in various experimental projects that are taking place in Maryland.

It has had several meetings during the current presidential year, but at the time of the Faculty's 1970 Annual Meeting, has nothing concrete to report.

Respectfully submitted,
Thomas B. Turner, MD, *Chairman*
Charles C. Carpenter, MD
John Krantz, PhD
Glen D. Lubash, MD
Howard J. Garber, MD
Robert I. Levy, MD
Matthew Tayback, ScD

Ad Hoc Committee to Consider Consent Forms and Emancipation of Minors

Mr. President and Members of the House of Delegates:

This ad hoc committee held two meetings for the purpose of drawing up sample consent forms for use by hospitals or individual physicians under varying circumstances.

Thirteen forms were developed and distributed to all hospitals in the state. Additional sets have been requested by many hospitals and several individual physicians.

Respectfully submitted,
John F. King, Esq., *Chairman*
Edward F. Cotter, MD
Everett S. Diggs, MD
Brannon Hubbard, Jr., MD

Ad Hoc Committee to Discuss Multiphasic Screening

Mr. President and Members of the House of Delegates:

This ad hoc committee was named by the Council to consider and make recommendations with regard to multiphasic screening. It held several meetings and on June 11, 1969 made a report to the Council which would delay any definitive action for the time being.

The Council has accepted the report but did not disband the committee, instead requested it to reconsider and reevaluate this subject on a six-month basis.

Respectfully submitted,
Manning W. Alden, MD, *Chairman*
Wolcott L. Etienne, MD
Wilmer K. Gallager, Jr., MD
Charles F. O'Donnell, MD

Ad Hoc Committee on Standards for Renal Dialysis and Transplantation

Mr. President and Members of the House of Delegates:

This ad hoc committee was named by the President in August 1969. It held three meetings.

Shortly after its appointment, the local Kidney Foundation established a large group with subcommittees to accomplish the same objectives as this committee. There was considerable discussion as to whether this committee should continue to establish standards since it was felt that only physicians and the medical profession were qualified to develop medical standards. However, it was agreed that this would merely be a duplication of effort, and that such standards, when established by the Kidney Foundation committee, should be reviewed by the ad hoc committee.

There was some discussion of funding dialysis programs and it was agreed that the Department of Health and Mental Hygiene would undoubtedly be the body to consider such funding.

It was suggested that Mr. Sargeant be asked to serve on the Legislation and Public Information Committee established by the Kidney Foundation in order to have a direct liaison between the State Legislature and efforts of this committee.

It was agreed that this committee should remain in existence for the purpose of reviewing and approving drafts of the standards and ethics to be developed by committees of the Kidney Foundation. Otherwise, no further action is contemplated.

Respectfully submitted,
WILLIAM G. ESMOND, MD, *Chairman*
C. THOMAS FLOTTE, MD
ROBERT LEVY, MD
JOHN D. YOUNG, MD
J. B. ZACHARY, MD

TREASURER

Mr. President and Members of the House of Delegates:

An audit of the records of the Treasurer of the Medical and Chirurgical Faculty of the State of Maryland for the year ending December 31, 1969 is attached to the end of this report.

The other matter is the budget. The 1970 budget was very carefully worked out by the Budget Committee. We received estimates from everybody involved, as to the cost for the present year and the coming year. We have carefully considered these before formulating the budget.

This was taken to the Executive Committee and questioned carefully there. As a matter of fact, we went back and called in representatives from several departments such as the Journal, the Library and so forth, and then after full deliberation took it to the Council and it has been accepted by the Council.

You will note it is a deficit budget. We feel, however, for this year we can make out with this deficit budget and have to see what we can forecast for the coming year and if further funds are necessary we will make the case at the Semiannual Meeting.

Less items included in other budget headings (salaries, social security, etc.)	28,500.00	
		$5,000.00

Journal subscriptions, books, binding, etc., are paid for from designated fund income and are, therefore, not included in these figures.

Respectfully submitted,
KARL F. MECH, MD, *Treasurer*

ANNUAL FINANCIAL STATEMENT
of the
Medical and Chirurgical Faculty
of the State of Maryland

March 23, 1970

CERTIFICATE

The Medical and Chirurgical Faculty
of the State of Maryland,
1211 Cathedral Street,
Baltimore, Maryland 21201

Gentlemen:

We have made an audit of the records of the Treasurer of The Medical and Chirurgical Faculty of the State of Maryland for the year ended December 31, 1969. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures that we considered necessary in the circumstances.

In our opinion, the balance sheet, together with the supporting statements, present fairly the financial position of the Faculty as of December 31, 1969 and the results from operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

WOODEN, BENSON & WALTON

THE MEDICAL AND CHIRURGICAL FACULTY OF THE STATE OF MARYLAND

Baltimore, Maryland

BALANCE SHEET—DECEMBER 31, 1969

WOMAN'S AUXILIARY

Mr. President and Members of the House of Delegates:

Your Woman's Auxiliary appreciates this privilege of reporting to you on the accomplishments of this past year.

We have tried to insure continuity of already existing programs with especial accent on youth and a determination to create a better image of American medicine and thus foster favorable public sentiment.

Through conscientious efforts to support the American Medical Association Education and Research Foundation, we have raised a significant sum of money for medical education and research—more than $6,200. I should like to express to you deep appreciation for your action taken to channel through the Auxiliary AMAERF chairman all funds collected from Faculty members as of November 3, 1969. This will enable us to compete on the same basis with other state auxiliaries credited with medical society donations. We are determined that your altruistic decision to relinquish the honor of presenting this fund at the AMA House of Delegates will not decrease our own independent efforts to raise funds for medical schools and the Student Loan Guaranty Fund.

We have expanded upon our programs for Children and Youth, the committee for which was instituted only last year. One county auxiliary has been exemplary in its involvement in its Child Development Council and work in the Family Life and Sex Education program. Many of our members have been actively working with school and church groups, presenting programs on drug abuse and alcohol. We have continued the battle against violence in movies, TV and radio through visitation to the State Board of Movie Censors and through letters to responsible persons. We have continued to work for representation at the White House Conference on Youth and to date have secured one appointment to a subcommittee.

Our members have responded superbly to the need for more medical and paramedical personnel in many ways. Over and above the financial help of $300 from our state auxiliary treasury allotted to the Future Nurses —Health Career Clubs of Maryland, scholarships and loans are provided by the auxiliaries of Baltimore, Montgomery, Prince George's, Washington, and Wicomico Counties. The Baltimore City auxiliary this year has presented five loans to students, totaling $3,599. The Prince George's County Auxiliary presented three nursing scholarships totaling $1,600 and helped their medical society select winners for three more scholarships. The Allegany County Auxiliary worked very diligently promoting the nine Health Careers Clubs in its county and in producing in cooperation with the Board of Education the second annual Health Fair held March 23, 1970. The Harford County Auxiliary has completed a slide presentation of medical and paramedical careers available in Harford County, along with a tape narration, and has shown it to junior and senior high school students.

Our mental health program this year has been mainly concerned with children. Our members have given financial support to mental hospitals and day care centers for retarded persons; provided transportation for patients to mental health clinics; contributed to "Operation Santa Claus"; given books, toys, toothbrushes and tooth kits to institutions for mentally retarded; shown films to school children on drug abuse and alcohol; and supported their local Mental Health Associations. One auxiliary provided hostesses for the World Federation of Mental Health in Washington, D. C. *M.D.'s Wife* magazine has recognized one Maryland auxilian's role in establishing a day care center for retarded persons and has requested more information for a feature article.

We purchased a filmstrip entitled "A New Look at the Old Sauce", an entertaining cartoon that teaches, not preaches, about the use and abuse of alcohol. Auxilians in Allegany, Harford and Wicomico counties have shown this to school children in their communities and have evoked very favorable responses.

The interest of the auxiliary in legislation has been maintained: Two component auxiliaries have traveled to Annapolis by bus to visit the Legislature and their local representatives. Another auxiliary visited with its county commissioners. Membership in MMPAC is always encouraged; six members of the auxiliary, including the president, attended the national AMPAC workshop in Washington, D. C. on February 28, 1970. The auxiliary is always on the letter-writing alert in behalf of good medical legislation and most recently responded to your "Medical Alert" to oppose House Bills 807 and 403.

Auxiliary action in community health services means recognizing the local community's needs and then doing something constructive about them, oftentimes in cooperation with other existing organizations. Throughout the state we have a fine record of community health services of a widely varying nature. These include participating in a Cardiac Symposium; mailing of tuberculosis Christmas seals; fighting air pollution and litter; cooperating with the Heart Association, American Cancer Society, local hospital auxiliaries, and garden clubs; distributing poison control information, and staffing diabetes detection clinics.

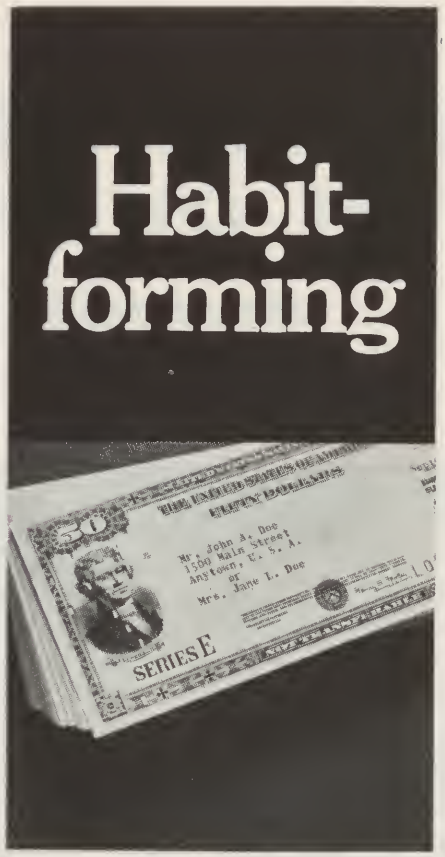
Not only has the auxiliary been pleased to respond to the Faculty's call for representation on the Legislation and Public Relations committees, but the auxiliary president has been privileged to attend seven meetings of the Faculty's Program and Arrangements Committee. She assisted with arrangements for the Semiannual Meeting in Hershey, Pennsylvania, September 1969, organizing an innovation in the program—Auxiliary Fun Night, a well-received evening of entertainment by members of the auxiliary and their families. The auxiliary has also complied with requests of the Program and Arrangements Committee to plan an Art and Hobby Show for the Annual Meeting and to provide hostesses for the exhibitors at the Alcazar.

Great emphasis was placed on increasing our membership. It is an established fact that the greater our number, the more effectively we can serve the Medical and Chirurgical Faculty. The auxiliary is grateful to the Faculty president for his cooperation in our membership drive. His letters to those physicians and their wives who were not auxiliary members procured for us 43 new members to date. Our greatest increase in membership this year has been among the members-at-large—25 new members, bringing our membership in the 10 unorganized counties to a total of 55. Even though we have attracted many new members, due to resignations and moves to out-of-state, our number has remained almost static—942. We recognize a sad illness among physicians' wives—one called APATHY—and we hope you will help us find the cure.

Your auxiliary has had close rapport with the Woman's Auxiliary to the Southern Medical Association through our councilor and vice-councilor. It is noteworthy that several of our Maryland auxiliary members hold positions on the Southern Medical Auxiliary board. Doctors' Day, originally promoted by this southern auxiliary, was observed by each of our component auxiliaries

and by many of our members-at-large. Governor Mandel's proclamation was secured and distributed widely. Besides the use of the red carnation and many social functions to honor our physicians, AMAERF contributions were made, books were purchased, library displays were set up, and niceties extended to patients in many hospitals.

Your auxiliary has promoted international health activities by extending hospitality to foreign medical personnel and by collecting sample drugs, books, used instruments, and clothing for overseas shipment. Names of volunteers have been added to the list of interpreters for foreign-speaking patients. This year, for the first time, in conjunction with the Annual Meeting, the auxiliary chairman for International Health Acitivities planned an educational and entertaining fund-raising evening on April 1 at the Belvedere Hotel. Exhibits of articles collected, hand-out literature, gay posters, an inspiring talk by a Baltimore physician who has served in Vietnam, oriental dances, auction of a piece of sculpture entitled "International Help", a dinner with an international menu, and a fashion show for both men and women were some of the features of the evening. The profit realized will be used to cover shipping expenses of collected articles and to make a significant contribution to a project such as the ship HOPE. The auxiliary is grateful to the Faculty for its approval of this project and for its cooperation in making it a success.



We have kept our membership informed of our goals and accomplishments through two issues of our newsletter, *Hygeia Filiae,* which is also sent to the national auxiliary officers and to leaders in the other 49 state medical auxiliaries. We are appreciative for the opportunity to communicate with the Faculty members through the Auxiliary Page of the MARYLAND STATE MEDICAL JOURNAL.

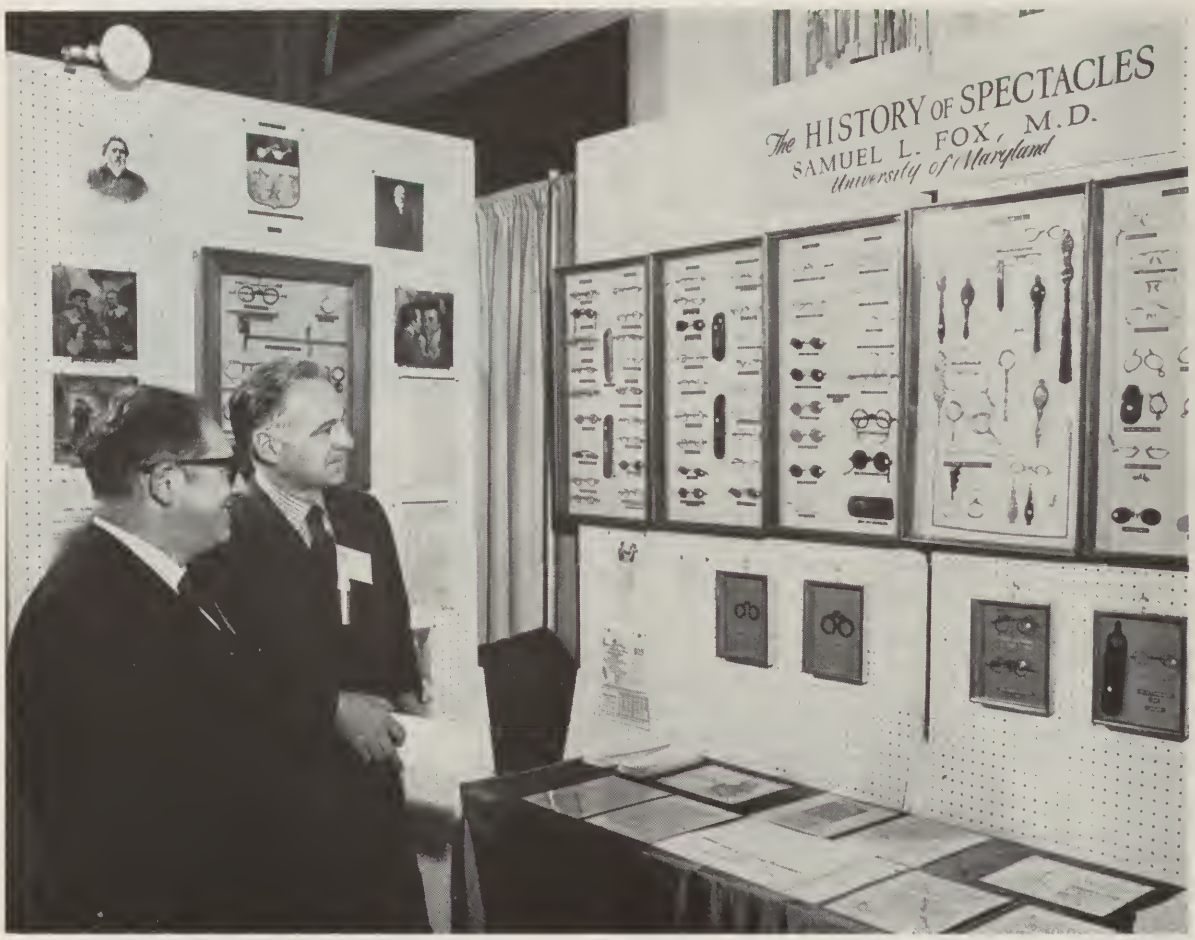
Due to the generosity of the Medical and Chirurgical Faculty, who has again this year contributed $1000 to the auxiliary, we have not had to raise dues and our finances are in good order in spite of rising costs. The auxiliary is indeed grateful to the Faculty for this expression of confidence in us. We are also indebted to the Faculty for the clerical assistance afforded us by its staff.

Since the Faculty chose for its theme for the Annual Meeting "Medicine Looks to the 70's" and since our accent has been on youth, I chose for the theme of the auxiliary's Annual Meeting "Youth in the Soaring 70's". In keeping with this theme, our keynote speaker was Matthew Debuskey, MD, Associate Professor of Pediatrics, The Johns Hopkins University School of Medicine, whose topic, "Generation Without Shadow", was most thought-provoking and enlightening. Also in keeping with our accent on youth, we heard reports at our General Session from the young ladies who are presidents of the Future Nurses—Health Careers Club of Maryland and the University of Maryland chapter of the Woman's Auxiliary to the Student American Medical Association, both of these organizations recipients of our financial assistance and counsel.

The auxiliary has tried to fulfill its objectives to assist the Medical and Chirurgical Faculty in the advancement of medicine and general health and to encourage students to elect medical careers and we fervently hope that the Faculty has found us helpful. We pray that as the auxiliary approaches its 21st year in this new decade, the Faculty and Medicine as they "look to the 70's", can depend on us as physicians' wives to brighten that outlook.

Respectfully submitted,
MRS. WALLACE H. SADOWSKY, *President*

When you stack one U.S. Savings Bond on top of another, it becomes a habit that's tough to break and hard to beat. That's because it's so painless. Just tell your employer or banker to set aside a regular amount for you before you have a chance to spend it. Sign up today.



New Freedom Shares

Bonus opportunity for people who buy Bonds through the Payroll Savings Plan or Bond-a-Month Plan — a new U.S. Savings Note called Freedom Shares. It pays a higher rate of interest and matures faster. Get all the facts where you work or bank.

U.S. Savings Bonds, new Freedom Shares

HIGHLIGHTS—

Awards and Presentations

Samuel L. Fox, MD (left) a Pikesville resident and ophthalmologist at the University of Maryland School of Medicine, discusses his prize-winning exhibit, "The History of Spectacles", with DeWitt DeLawter, MD, of Bethesda, during the Annual Meeting in April. Dr. Fox's display was judged best of all scientific exhibits at the meeting. Dr. DeLawter served as chairman of the Program and Arrangements Committee.

ANNUAL MEETING 1970

Arthur G. Siwinski, MD, of Baltimore (left), receives the past-president's plaque from Russell S. Fisher, MD, president of the Medical and Chirurgical Faculty, at the Annual Meeting in April.

Dr. Fisher presents the Community Service Award plaque to Aris T. Allen, MD (left), an Annapolis general practitioner. Dr. Allen is also Minority Whip (Rep.) in the Maryland House of Delegates. The presentation was made during the Annual Presidential Banquet.

Checks totaling more than $33,000 in contributions to medical schools in Maryland are presented to John Neff, MD (far left), representing The Johns Hopkins School of Medicine, and John Moxley, MD (center), from the University of Maryland School of Medicine. Making the presentation is Russell S. Fisher, MD, president of the Faculty.
Money for the American Medical Association Education Research Foundation was raised with the help of Med-Chi's Woman's Auxiliary.

Accepting the gavel as new president of the Faculty is Henry A. Briele, MD (right), a general practitioner from Salisbury. At left, Russell S. Fisher, MD, out-going president, congratulates Dr. Briele.

by John Sargeant
Executive Director

On Friday, April 3, 1970, the House took the following actions:

1. Elected the slate of officers presented to the Wednesday session;
2. Declined to consider the resolutions sponsored by Prince George's County (*see page 29*);
3. Adopted the following motions offered by the Mediation Committee:
   (a) To rescind the action of the House of Delegates taken in 1962 which was that "Podiatrists should not be on hospital staffs nor engaged in open surgery."
   (b) Adopt the same standards as of January 1, 1970 with respect to Podiatrists as the Joint Commission on Accreditation of Hospitals;
4. Heard a report from the Woman's Auxiliary President on the past year's activities;
5. Adopted Resolution 1A/70 (*see page 79*);
6. Adopted Resolution 2A/70 (*see page 79*);
7. Adopted Resolution 3A/70 (*see page 80*);
8. Adopted the following motions, all under new business:
   (a) That the House urges the Legislative Committee to use every effort to attempt to retain the present legal limits of Podiatric practices.
   (b) That the President of the Faculty appoint an Ad Hoc Committee to investigate all facets of the MEDIC network and render a report to the House of Delegates at the 1970 Semiannual Meeting, with such report being distributed to all House members in advance of such meeting.
   (c) The Faculty directs its members on the Blue Shield Board to work towards elimination of arbitrary restrictions on the number of visits a physician may make in treating his patients.
   (d) Whereas, the Program and Arrangements Committee of the Faculty works long and hard to obtain speakers of national prominence for Annual and Semiannual meetings, both current and past; and

   Whereas, The attendance at some of the meetings of the current Annual Session was embarrassingly small; and

   Whereas, The quality of the various endowed lectureships is endangered; and

   Whereas, The Alcazar's future is somewhat in doubt and its facilities are not what could be considered the most modern and attractive; therefore, be it

   Resolved, That the Program and Arrangements Committee be instructed by the House of Delegates to:

   (1) Explore the possibility of finding a more attractive facility for the location of the Annual Meetings, and

   (2) Explore any necessary methods to increase physical attendance of members and guests commensurate with the quality of the speakers

   (e) The action of the Council be ratified in supporting repeal of all abortion laws in the State of Maryland and that the Faculty be represented at the public hearing in this regard scheduled by the Governor for Wednesday, April 22, 1970, at 2:00 PM.*

   * *Changed to April 23, 1970.*

The girth control pill

Tepanil® Ten-tab®

(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic cardiovascular effects reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythema. Gastrointestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

Baltimore City Medical Society

Minutes—April and May 1970

The Board of Directors of the Baltimore City Medical Society met on April 14th at 4:30 PM at 1211 Cathedral Street.

The minutes of the March 10th meeting were approved as written.

In view of recent comments regarding the efficiency and effectiveness of the Professional Relations Committee, a general discussion of the functions of the committee took place. The Board felt that the relationships among the Professional Relations Committee, the Med-Chi Mediation Committee and the Maryland Commission on Medical Discipline should be more clearly defined and it was suggested that further information be gathered before any attempt is made to reorganize the Professional Relations Committee. To this end, it was suggested that Lewis P. Gundry, MD, chairman of the Med-Chi Mediation Committee, and John M. Dennis, MD, chairman of the Maryland Commission on Medical Discipline, be invited to the next meeting of the Board to describe their respective committees.

A suggestion was made and approved that all committee work be done through the Society office to ensure continuity of records and communication. It was also urged that whenever possible, the Society secretarial staff should attend the meetings of the committees so that proper transcripts are available.

A question of whether the Bylaws should be amended to require that committee chairmen attend and report at all general meetings of the Society was considered. The idea of compulsory attendance was not favored by the Board but it was suggested that committee reports be carried on the agenda of each meeting and that committee chairmen be encouraged to make a written or oral report as often as possible.

The Board unanimously agreed to send a letter to the Governor urging that he sign the abortion bill recently passed by the State Legislature.

The Board then considered the problem of "Peer Review" and concurred in the recent suggestion from the State Medical Society that each individual component society form a Peer Review Committee. Dr. Classen stated that he would gain further information on the subject of how the committee should operate prior to its selection.

Philip Wagley, MD, reported that he had written to Gordon Walker, MD, asking if he would serve on a committee to investigate the Maryland Artificial Kidney Treatment Fund.

Because of the special meeting of the Council of the Medical and Chirurgical Faculty of the State of Maryland, scheduled for May 12, 1970, the Board agreed to change its next meeting date to Tuesday, May 5, 1970.

There being no further business, the meeting was adjourned at 5:40 PM.

The May 5th meeting of the Board of Directors of the Baltimore City Medical Society was called to order by John N. Classen, MD, at 4:30 PM at 1211 Cathedral Street.

The minutes of the April 14th meeting were approved as distributed.

Under discussion are the various roles of the Med-Chi Mediation Committee, the Maryland Commission on Medical Discipline and the Baltimore City Medical Society Professional Relations Committee in the handling of complaints against physicians. John M. Dennis, MD, chairman of the Maryland Commission on Medical Discipline explained that this body functions as a court and has jurisdiction over all physicians in the state whether or not they are members of the medical society. The investigation of all complaints is carried out by the Med-Chi Mediation Committee. The commission is endowed with the power of subpoena and can take action against a physician

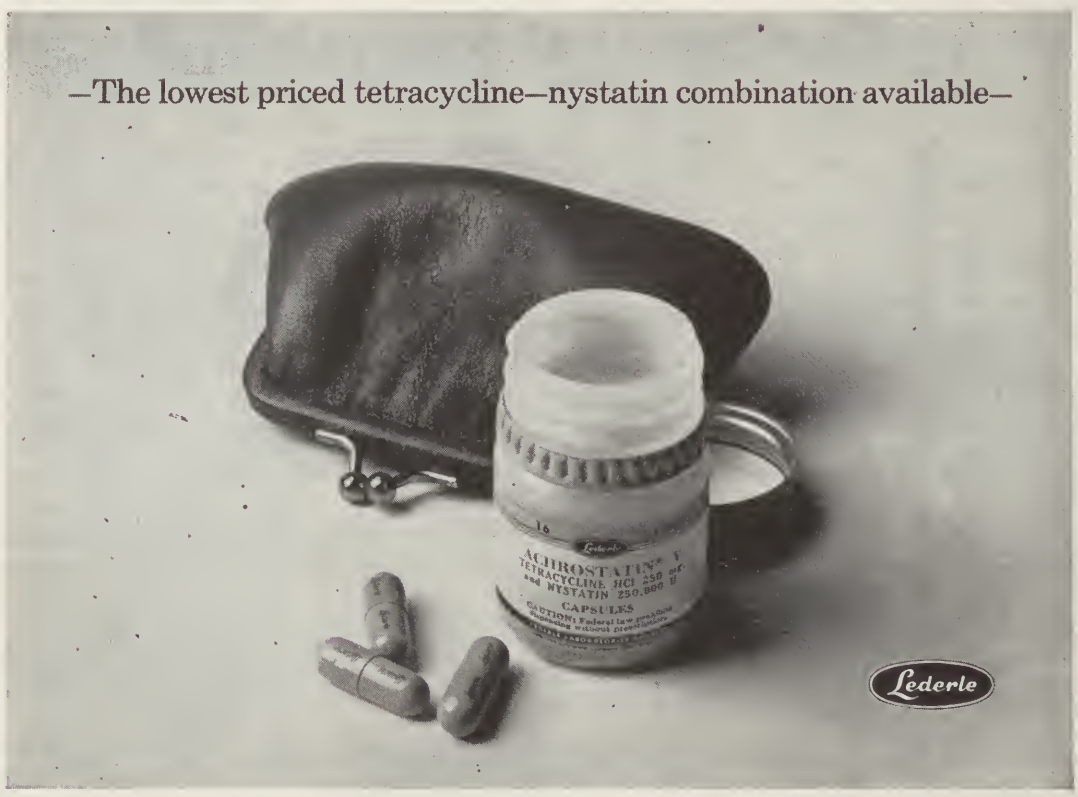
prior to his conviction in court.

The Med-Chi Mediation Committee considers cases referred to it by the commission, the state society, or by a component society. The committee can also institute an investigation if necessary. After investigation, if the Mediation Committee feels that action by the commission is warranted, it can refer, with recommendations, any case to the commission for consideration.

The basic structure, therefore, for handling complaints should be that, if possible, the case should be settled on the component society level. If no agreeable solution can be found or if there is reason to believe that action should be taken against a physician the matter should be referred to the Mediation Committee, and then, if necessary, to the Commission on Medical Discipline.

A recommendation was made and approved that in order to ensure efficiency and continuity, the membership of the Professional Relations Committee should not rotate.

The Board discussed the report of the Med-Chi Policy and Planning Committee concerning the recommendations for reorganizing and revitalizing the AMA. It was agreed to write to the Med-Chi Council urging the adoption of this report as presented.



A free medical clinic has been opened on Greenmount Avenue and much concern was expressed by the members of the Board as to the legalities of operating such a clinic and what caliber of medical care was being provided. It was the consensus that the administrator and medical director of the clinic be invited to the next meeting of the Board to discuss the matter.

A National Conference on Medicine and the Federal Coal Mine Health and Safety Act of 1969 will be held in Washington, DC, on May 15-18. The Board agreed that if anyone was attending this conference from the Society, they should be requested to present a report to the Board, but that no official representative should be sent.

The Woman's Auxiliary has suggested that a combined meeting of the Society and the Auxiliary be held during the Annual Meeting in December, but the Board was of the opinion that although the Society would be happy to co-sponsor such a social event, the business of the society could not be adequately appreciated at a primarily social function.

Dr. Classen asked members of the Board to suggest names to him of individuals who might be interested in working towards the formation of a Peer Review Committee for the Baltimore City Medical Society. He stated that he believed that this was a most important function, but that in order to have the committee operate effectively it would need a chairman who was vitally interested in the project.

There being no further business, the meeting was adjourned at 5:45 PM.

JAMES E. CARSON, MD, COMMISSIONER
KURT GORWITZ, ScD, STATISTICS DIRECTOR

Maryland State department of mental hygiene

A Report to the Fifteen Southern States*

Hospital services for the mentally ill in all Southern states have progressed substantially in recent years. However, statistics published by the Office of Biometrics of the National Institute of Mental Health show that this marked improvement has failed to reduce the appreciable gap in services between the Southern states and the rest of the United States. The net and percent differences in average daily per patient expenditure and ratio of employees to patients is now higher than it has been at any time previously.

AVERAGE DAILY PER PATIENT EXPENDITURE	15 SOUTHERN STATES	REST OF UNITED STATES	NET DIFFERENCE	PERCENT DIFFERENCE
1959	$3.11	$4.66	$1.55	–33.3
1964	4.57	6.77	2.20	–32.5
1968	7.76	11.41	3.65	–32.0
1969	8.81	14.03	5.22	–37.2
NUMBER OF EMPLOYEES FOR EVERY 100 PATIENTS				
1959	26.9	33.9	7.0	–20.5
1964	35.5	41.7	6.2	–14.9
1968	46.1	54.9	8.8	–16.0
1969	48.5	61.6	13.1	–21.3

Total hospital maintenance expenditures by the 15 states more than doubled in this ten-year period (from $136 million in 1959 to $337 million in 1969) and average daily per patient expenditures are now two and one-half times the 1959 figure. However, since comparable changes occurred in the other 35 states, the South's relative position has remained essentially unchanged. In fact, the South's daily average in 1969 of $8.81 was exceeded by all except one of the other 35 states. Arkansas, which had the highest per patient per day cost among Southern states ($16.75), ranked 14th nationwide. Kentucky, with the second highest cost among Southern states ($12.86), ranked 25th nationwide. Maryland ($12.50) ranked third among Southern states and 28th nationwide. Related to this, the average size of the patient population declined 17.5% (from 126,824 to 104,671) in the Southern states during this ten-year span and 16.8% in Maryland (from 8,952 to 7,451) while the comparable figure for the rest of the country was 24.0% (from 415,311 to 273,962).

This disparity does not necessarily reflect a lesser interest and support for mental hospital programs. It does relate to the relatively lower economic level of most Southern states. Figures released by the U.S. Department of Commerce indicate that the South's per capita income continues to be one fourth lower than the rest of the United States with only Maryland being above the national average. This in turn has produced lower than average per capita expenditures for all state services.

The South has been characterized as an area in transition. Gradual economic and social development can be expected to produce in the mental health field a concomitant continuation of the progress experienced in recent years. However, it must be recognized that unless this is rapidly accelerated much of the South will perpetually continue to lag appreciably behind the rest of the United States.

Diamonds Come In Many Shapes

A unique shape diamond in its appropriate mounting creates a remarkably different and most unusual ring.

Besides the round, there are heart shapes, emerald cut, pear shapes, crescents, marquise, half moons, tapered, square cut, baguettes, etc.

We'd like you to see these out-of-the-ordinary diamonds.

June, 1970

THE FACTS !!

According to the AMA Newsletter, Robert J. Myers, Actuary for the Social Security Administration, presents a comparison of annual increases in physicians' fees and in general wages, in his new book, MEDICARE.

The comparison is instructive, especially in view of the criticism of physicians' fees by those seeking a scapegoat for the high costs of Medicare and Medicaid. The average annual increase in fees for the years 1956 through 1965 was 3.0%, but the average annual increase in wages during the same period was 3.6%.

Increases were 5.9% in 1966; 7.3% in 1967 and 5.5% in 1968, but the total fee increase during the three-year period was only 1.0% above the rise in the general wage level.

NEW PUBLICATION

The new (second) edition of Current Procedural Terminology is now available from the American Medical Association at a cost of $2 per book. A five-digit code is used in this new publication.

NEW COMP SCHEDULE

It is anticipated that the newly revised Workmen's Compensation Fee Schedule will be effective about July 1, 1970. The public hearing held on May 14, at the Workmen's Compensation Commission offices brought little discussion and objection to changes in payment for physicians' services since the last schedule was published, effective November 1, 1961.

It is understood that the schedule will remain under constant scrutiny so as to effectively reflect changes in costs to the physician and the public. Target date for publication of the next schedule is 1972.

AMA LONG RANGE PLANNING

The AMA's Committee on Long Range Planning presented a lengthy report to the AMA House in November, 1969. Action on the recommendations contained in the report was deferred until June, 1970, when the AMA House asked State Medical Societies to prepare and submit resolutions to effect the policy-recommendations contained in the report.

AMA LONG RANGE PLANNING (cont'd)

The Faculty's Council met in special session on May 12 to consider recommendations of the Policy and Planning Committee. Full details can be obtained from the Faculty office.

DRUG ABUSE ACCESS CENTERS

The first of several Drug Abuse Coordinating and Counseling Centers in the state will be opened in Baltimore in the near future. The center will be located at 25th and Calvert Streets and will be manned by employees of the state's Drug Abuse Authority.

The centers will provide the public with access to information on treatment facilities and local assistance.

MORE MEDICAL SCHOLARSHIPS

The Wicomico County Council has established two medical scholarships amounting to $2,000 a year. These amounts are available to persons who agree to practice in the county for a five-year period following graduation from medical school.

While county residence is not required, preference in awarding the scholarships would undoubtedly be given to residents.

SEMIANNUAL SESSION

The Faculty's Semiannual session will again be held in Hershey, Pa., at the Hotel Hershey. The House of Delegates will meet Friday morning, September 11, 1970, at 9:30 a.m. Following the meeting will be a scientific program.

Reservation forms, found elsewhere in the Journal, should be completed and mailed directly to the Hotel.

PHYSICIAN MANPOWER STUDY

The Faculty, in cooperation with the Department of Health and Mental Hygiene, is completing a study of the physician manpower supply in Maryland.

When finished, physician population by county, specialty, school of graduation, postgraduate training and age group will be available. It will be the first comprehensive, detailed study of practicing physicians in the state.

News

Medical Library Association, 1970

The Medical Library Association meeting, May 17-22, gave medical librarians from the more northerly states a taste of summer and a second chance within the past year to convene for continuing education courses, conferences with other similar group librarians, and a glimpse of a beautiful city. Texas librarians programmed the Medical Society Group luncheon meeting this year, with Dr. Alton Ochsner, President of Alton Ochsner Foundation, speaking on "Medical Libraries and the Practicing Physician".

State-of-the-Arts—Med-Chi Library

A state-of-the-arts summary of the library's activities is being developed, which may question the validity of surveys and statistics such as the recent questionnaire circulated by the Faculty. Several physicians who use the library regularly do not remember answering or even seeing the questionnaire. The Library Committee would appreciate a direct communication regarding the effectiveness of the library's services. Please take a moment to drop us a note!

Generation Without Shadow

MATTHEW DEBUSKEY, MD
Associate Professor of Pediatrics
Director, The Johns Hopkins Community Pediatric Program

Highlight of the 21st annual convention of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland held recently in Baltimore was the keynote address by Matthew Debuskey, MD, Associate Professor of Pediatrics at The Johns Hopkins University.

Dr. Debuskey was born in Baltimore, was graduated from The Johns Hopkins University, and received his MD degree from The Johns Hopkins University School of Medicine. He interned at Johns Hopkins Hospital, and served as resident at New York Hospital in New York city, and at Children's Memorial in Chicago. The War Years saw Dr. Debuskey as Major Debuskey in the United States Army. He was certified by the American Board of Pediatrics in 1949. He has the reputation of being "a Doctors' Doctor". Dr. Debuskey is a member of the Baltimore Association of Retarded Children, the Maryland Association of Mental Health, a Director of the Health and Welfare Council, and is the Medical Coordinator of the Head Start Program of the State of Maryland.

Confusion is battering our society today. This is not unprecedented. On many previous occasions our complacency has been shattered, and changes—significant changes—have occurred. But the current agitation, at times approaching panic, is singularly characterized by an eerie and startling feature: A generation has lost its shadow.

This is not a local phenomenon. Signals are sounding throughout the world. The deafening clamor on the streets of our cities is echoing on the lawns of our suburbs, and is reverberating on the fields of our countryside.

This is not solely an American phenomenon, nor is it limited to countries of affluence. Its existence has been publicized in England, France, Japan, Mexico, Mainland China, and students, in time-honored tradition, are providing the spearhead. A parent generation has lost its shadow.

The timid and the fearful, particularly among the elders, recognize in the din a tocsin of alarm, and respond with either abject submission or stern retribution. Cynics and pessimists identify an ominous tolling of disaster that is implacably threatening the existence of our society. Impulsive youth hears joyous peals of release and liberation. To the great majority of us, however, both young and old, the full significance is not clear, and it is the speculative interpretations and fragmented responses that cleave us into factions, and threaten the linkage between our generations of youth and adult, children and parents.

Generally, in the past, social divisions have occurred in a vertical plane, grouping regions of the world, segments of a country or sectional slices of a local population. There has existed separation of patrician and plebe, wealthy and impoverished, conqueror and vanquished. But currently, disrupting our composure, there is occurring a horizontal rift, breaching on the shibboleth of age, challenging seriously our powers of adjustment.

It is the cultural obligation of adults to orient children and youth to the customs and habits of the society in which they live. It enables the senior to complete his life in a recognizable setting that provides the ineffable satisfaction of having lived

This material, in substance, was initially presented at Florence Crittenton Northeast Area Conference.

by standards, which being perpetuated, are automatically transmuted into universal truths. It permits youth to mold himself into a niche that will not be abrasive, however distorted he might become.

The leading generation has always been able to vindicate its judgments and to reinforce its self-esteem, by looking back and down to recognize its own silhouette in the shadowed generation that was to succeed it. But now that image, vanished, challenges the verity of our codes and the substance of our values. Our senechals command the shadow to return, our seers ascribe its obliteration to flood clouds of destruction. But youth, denouncing the rheumy vision of its elders, points upward to the sun at its zenith, casting no shadow, but instead vividly illuminating the flaws and blemishes that mar its generation of predecessors.

Which point of view is more accurate is difficult to say. Probably none is totally true, none is completely wrong. Certainly none is sufficiently practical to be used as the sole guide in the readjustment of goals and directions that seem so essential today.

There are multiple factors operating constantly in the gradual evolution of social change. It is the unprecedented conjunction of these many circumstances that is provoking the estrangement of the two generations. In general, age is more rigid and resists change to the structure with which it is familiar and secure; youth, pliable and undaunted, is inclined to risk change and to stake opportunity against security.

The model of generation imprinting has operated well through the long ages of man, during which time change has been slow and pedestrian. But, almost abruptly on this vast scale of history, we are swept forward with an incontinent speed and an accelerated pace, that makes hazardous any prediction for a decade in the future, and literally defies any prophecy a generation removed.

In the past, there has existed, from time to time, a social issue of parents versus peers, but never to the degree that pertains today. The changing form of our primary social unit, the family, is supportive of this development. The traditional extended family, where control or domination is exercised by the titular family head, is rapidly disappearing. This arrangement, in which a senior member, usually a male "pater familias" was responsible for the conduct and performance of each of the family juniors, often extending for several generations, created clusters of individuals whose clan-like customs and creeds bound, almost inextricably, antecedents and descendents, to a uniform code of behavior and a legacy of common beliefs. This classical model is being replaced by the nuclear family unit—a father, mother, and dependent children—in which setting independence is encouraged and the ideal structure for the transmission of tradition is attenuated.

One basis for this change is increased mobility. Mobility in its various forms and guises, achieved through revolutionary technological advances and critical social changes.

Geographic Mobility

We no longer travel painfully by foot and slowly by sail, but by engines, successively steam, internal combustion, turbine, jet, each swifter and more economical than its predecessor. So swiftly do we fly, that our daily physiological cycles, the circadial rhythms, are disrupted in ordinary transoceanic flights. No longer is one confined throughout life to an occasional visit to the county fair or to a periodic meeting in a neighborhood church or pub. No longer are families clumped like bulbs budding off a parent root, but are swept like pollen far from their site of origin. The children of a family might be scattered from coast to coast, exposed to new conditions, requiring solutions alien to monolithic concepts of earlier generations.

Occupational Mobility

The freedom of vocational selection and an unimpeded opportunity to pursue it, is recognized as a stable plank in the platform of any progressive society. Seldom do we find the butcher's son a butcher, the farmer's son a farmer, or the tradesman's son in trade. We encourage youth to climb the rungs of economic privilege.

Social Mobility

However, slowly, there is developing a disruption of groupings by ethnic or religious identity. Social isolation based on these barriers is a diminishing factor.

Feminine Mobility

Encouraged by the economic needs of several wars, the liberation of woman from her limited traditional roles has proceeded rapidly. Her newly achieved freedoms—political, economic, educational, and, recently, sexual—present a most vivid illustration of the changed viewpoint of successive generations.

Communication Mobility

Communication is no longer limited to word of mouth or to a locally oriented weekly newssheet. No longer must we depend on old standard books of reference or a prejudiced journal for a stock of facts for the honing of opinion. The printed page is now voluminous, and wire, wireless, and instantaneous radio and television carry us from a narrowly circumscribed and limited experience to a global exchange of ideas and developments.

This soaring sweep of technological progress and cultural mobility constantly challenges and at times outstrips our psychologic, sociologic and economic

abilities of adjustment to the inevitable changes. Maybe youth, unencumbered by habits and attitudes established in the pre-electronic age, is more likely than we are to make this adaptation successfully.

We seek to provide our children with greater skills in coping with future uncertainties and changes, and raise the level of educational expectations. Two generations ago only 10% of our people completed high school. Presently there is a diminution of unskilled and semi-skilled jobs to accommodate our untutored or deficiently equipped youth. With the increased premium residing in diplomas, we are insistently urging all youth to complete at least a secondary education. In a few years, 50% of them will be exposed to the intellectual processes of a college experience. We induce them by persuasion, by cajolery, by coercion to increase their formal education and to sharpen their mental abilities. The present generation, if not wiser, is certainly more educated than the previous one. However, when from this laboriously achieved vantage point they focus on us their newly acquired scientific methods and principles of logic, to question our values and directions, we become shocked at their attitudes and incensed at their behavior.

They question our position on the relaxational expedients of contrasting generations: complacency toward alcohol; alarm toward marihuana. Yet both can cause distorted concepts of time and space, both can produce psychological dependence, and both can be responsible for accidents and violence.

They question our confusion in establishing an age for their initiation into the adult community: draft eligible at 18 years with risk of death or mangling, but no privilege to express an opinion by vote until 21, nor even trusted to consume alcoholic beverages until 21; the right to drive at 16, to have sexual intercourse at 16, but not to marry until 18.

And particularly relevant to this colloquium today, they question our attitudes toward sex, the secrecy which shrouds it, and the values that our code expresses.

Before pursuing the opinion of youth on this subject, it might be pertinent to cite several well recognized observations.

- The appearance of sexual maturation in our children is occurring at a younger age. If measured by menarche, the initiation of menstruation, there are statistics in England and America, disclosing during the last century a reduction in onset from an average age of 16, to one of 12; and the level is still declining. Possibly this is related to improved nutrition, better public health and hygiene.
- Levels of economic maturation are reached at a later age. With jobs scarce for youth, and education increasingly prolonged, the achievement of adequate financial means to sustain separation from parental support and the cost of an independent married household has been delayed.
- Our eagerness to accelerate maturational and cultural processes has resulted in a paradox. The watchword of "earlier and swifter" has extended to social experiences, and their progressive advances have carried our young to the ultimate sexual goal before we are ready to condone it.

These are some of the reefs that confront youth and must be recognized by all of us interested in the growth processes of adolescence. They must be marked on any chart designed to guide our young people through the hazardous passage to the deep waters of adult life.

Concerning our sexual tenets the questions that they pose, openly by the more articulate, tacitly by those less bold or less logical, are numerous.

Are we confusing love and marriage? The possession of both is an ideal base for sanctioning a sexual union. But if love without marriage is insufficient basis, then what about marriage without love? Is physical intimacy barred if love departs from marriage? Are divorce codes changing in recognition of the spiritual element in the legal union of man and wife? Are we hung up on the religious or on the secular aspects of the problem?

Is it age that determines our permissiveness, and are we as confused in establishing its limit, as manifestly we are in other aspects of maturity?

Does the old conventional double standard still operate? Is our prohibition more rigid when applied to girls than it is to boys? Is it fear that supports this aspect of our social code? Indeed, until recently the utilization of anxiety has been the major instrument in our sex educational plan. Fear certainly is a powerful force controlling behavior. At best, however, it has a negative inhibiting influence that requires regular reinforcement. Moreover, with the rapid medical and sociologic changes that are occurring and with the advanced knowledge that the juniors are acquiring, it might be useful for us to reexamine the reasoning that we employ and to separate phantom incubi from real threats.

First is the fear of pregnancy. This is probably the most formidable bastion that we have constructed. Certainly, its occurrence would appear to be the ultimate humiliation to parents. To the pregnant girl, the physical risk as well as the social, intellectual and psychological dislocations can be a major calamity. In addition, at least to me, one of the most vicious of all the effects is the malevolent stigma that is attached to the unconsulted child. A belated marriage that so often follows such an event frequently compounds the problem by uniting two people incompatible in the creation of any meaningful marital structure. But with the tremendous developments occurring in the area of planned con-

ception, it will not be long before extremely effective measures of contraception will be available. Then this real fear will become a spectral anxiety and its effect will be lost.

Second is the fear of disease. With newer and more effective drugs becoming increasingly available, this deterrent is rapidly fading. Furthermore, disease never occurs as result of contact between two people—there must be a third to introduce the infection. Promiscuity exists, but as an emotional distortion or a subcultural standard; a revival of the spiritual values of love and solicitude, to displace conquest and debauchery would result in a reduction of this desultory behavior. A segment of adolescents do advocate, at least in principle, the adoption of this behavioral code.

Third is the fear of a blemished reputation, damaging the maintenance of group esteem and the prospect of a felicitous marriage. It is true that group evaluation of conduct is another powerful incentive influencing behavior. But it is peer judgment that is most effective. With an increasing divergence of generational opinions and the increased tendency to peer orientation, the strength of this previously effective restraint will depend on the developing attitudes of youth.

Reiss, in 1959, conducted a survey at five schools, two colleges and two high schools in Virginia and one college in New York.[1] He analyzed and classified 821 responses into five separate categories expressing attitudes toward sexual intercourse.

	Male	Female
1) Abstinence	**28%**	**55%**
2) Permissiveness with affection	**24%**	**15% ***
3) Transitional double standard	**18%**	**10% ***
4) Orthodox double standard	**9%**	**13%**
5) Permissiveness without affection	**13%**	**2%**

*** 25% of the girls selected premarital intercourse with affection.**

Condensed by Smigel & Seiden [2]

Freedman interviewed college girls and reported 22% had experienced premarital intercourse.[3]

An interesting study explored the corelation between permissiveness and marital or family status.[4]

STATUS	Percent endorsing permissiveness	
Single	**44%**	
Married and childless	**23%**	
Married with pre-teen	**22%**	
Married with pre-teens & older	**17%**	
Married with teens & older	**13%**	**(Modified)**

Two interpretations might be proposed. First, there is a probable age difference of 20 or more years between the first and last divisions, and these differences could represent a progressive alteration in attitude developing between generations.

Second, the percentages depict a change of posture dependent on altered life circumstances. I should guess this latter to be the more likely explanation. And I am inclined to suspect that to some degree the very liberal and generous stance of youth today will be more constrained with their children tomorrow.

These then are some of the wedges that intervene between the generations, that threaten to broaden the cleft, and that interrupt continuity and communication.

We are advised constantly, as parents, to maintain avenues of communication with our children. But even when we carefully and consciously avoid the tendency for this dialogue to deteriorate into a didactic lecture or a carping diatribe, the language of feelings comes through clearly and emphatically. If parents find it so difficult to consider variations in such simple issues as dress, hair styles, dance and music, then how can they be expected to preserve any composure in discussing more fundamental differences in position? How can we dismantle the barriers erected between the abstract idealism of youth and our own personalized version of pragmatic realism? How do we avoid the stigma of hypocrisy in denouncing marihuana and indulging alcohol? The establishment of effective reciprocal communication cannot be commenced when children reach the critical age of adolescence. A parent is not a mime in a stock company who can effectively and instantly change his roles of authority, disciplinarian, guardian, etc., to that of confidante or counsellor. The basis for this latter interaction, if ever it can be developed, must be constructed early in life, and at a period when it might conflict with other more timely and appropriate relationships. If a youth recognizes, in the parent-child relationship, a prevailing tone of love and affection, his inclination will be to protect his parents from pain and disappointment, and will result in concealment; if anger and hostility, then exaggeration and retribution; if authority and punishment, then denial; if dependency, then prudence and secrecy. It is understandable, but not logical, for parents to chafe with inadequacy when some other mature and understanding adult, teacher, minister, etc., appears to form a better relationship with their teenaged child than they themselves were able to achieve.

Particularly in the area of sexuality is the senior generation awkwardly immobilized. Operating in this field are not only social habits and values but profound moral and religious implications as well. We have been imprinted so deeply with the notions of sin and secretiveness in sex that the embarrassment

generated in a discussion of many of its vital elements is a deterrent to any useful dialogue.

These are some of the dilemmas that we face in the evaluation of a parent-peer gap. Is it exaggerated? We are regularly bombarded through communications media with activities of the bizarre and of the combative. Obviously these depict a small but sensational segment of youth. Pertinent, however, are the questions: 1) Do they represent the outcropping of a sizeable subsurface deposit? 2) Does the extreme *deed* of the uninhibited few indicate the *creed* of the restrained many? Is it minimized? or does there exist a normally standard interval that is essential for progress? If it is of a threatening nature, either personally or socially, what do we do to reestablish some degree of serenity and stability?

Can we examine our own established attitudes and values, and attempt to redefine our position on the basis of intelligence and reason rather than prejudice and passion? Possibly if we relent a bit our stiff-necked posture and lean somewhat, the reappearance of the shadow, however foreshortened, will be reassuring.

One issue that we shall have to reappraise is our reaction to the attitude of youth to sex and sexuality. Sometimes I wonder if "war is too important to trust to generals" whether or not sex is too vital an aspect to life to trust to embarrassed and often unknowledgeable parents who can unwittingly transmit their own physical misconceptions and emotional distortions sequentially from one generation to the next. Even the best of marital and sexual adjustments achieved by husband and wife does not automatically endow them with the knowledge or skill to teach the elements of this accomplishment to their offspring. By a structured and formal inclusion in the school curriculum, it is time to recognize sexuality as a behavior pattern extending beyond reproduction and elevated above the sensual or carnal aspects with which it is so commonly equated. The spiritual elements of love and sacrifice and self-respect will have to be integrated into any concept of sexuality that is to serve as an ethical code to the fear-released generations to come.

If honest reassessment of our positions justifies a stand, then we should have the courage to remain firm in that position, impervious to pleas, resolute against intimidation, and staunch against sophistry and intellectualization. Finally, we must, at some time in a child's career, recognize that our active and principal task is ended. We have done our best, hopefully, to launch him into the uncertainty of tomorrow. We have offered him the charts we possess, the designs we have created. How he arranges the ballast to compensate for unsuspected contingencies is up to him. He must be given a chance to learn the strengths and weakness of his own craft. He is the ultimate helmsman. In spite of our accumulation of experience and our eagerness to impart this to our children, it is, unfortunately, a repeated observation, that the same trials and dismal errors seem to be destined for repetition in each generation. But maybe it is high-noon, the accepted moment for mariners to "shoot the sun" and to mark a point on their path toward a destination. Possibly youth, with his advanced knowledge and techniques, might possess a sextant far more accurate in establishing our position, than we can do with our worn systems of dead-reckoning and the triangulation of shadows.

Advantages of Quantitative Cultures in Diagnosing and Treating Acute Bacterial Pneumonia

Quantitative culturing of homogenized sputum led to more frequent isolation of pathogens than did routine qualitative culturing. It also provided pertinent information on superinfection and the effectiveness of antimicrobial chemotherapy.

Identification of the specific pathogen in acute bacterial pneumonia is necessary for rational and appropriate therapy. Routine qualitative bacteriologic cultures of sputum may lead to erroneous diagnosis and inappropriate therapy, particularly in patients with chronic obstructive lung disease.

Because tracheobronchial secretions are bacteriologically sterile, sputum cultures should show growth of only an etiologically significant organism. Rarely are such clear-cut results obtained. Even a carefully produced deep sputum from the bronchi becomes contaminated in passing through the bacteria-laden pharynx.

An organism which can cause inflammation of the lungs should be present in sputum in greater numbers than the contaminating pharyngeal residents. However, pneumonia pathogens, particularly *D. pneumoniae* and *H. influenzae* are irregularly distributed in sputum. This leads to inaccurate results when the portions of sputum which contain few or no pathogenic organisms are inoculated onto media. Liquefaction and thorough mixing of sputum permit more uniform sampling.

The present study of 20 pneumonia patients admitted consecutively into two hospitals at different periods was designed to evaluate the usefulness of quantitative cultures of fresh homogenized sputum in the diagnosis of bacterial pneumonia and in following its clinical course. Medical histories, physical examinations, and pulmonary-function tests revealed that the 19 men and 1 woman in this study had chronic obstructive lung disease. None had received antimicrobial treatment before admission.

PREPARATION OF CULTURES

All sputum specimens collected on admission and at intervals during illness were liquefied, homogenized, and buffered before being streaked onto a culture medium of blood, chocolate eosin-methylene blue, and Sabourand dextrose agar. Estimates of culturable aerobic microorganisms were obtained after 24-hour incubation at 37°C. Routine cultures from 18 were also studied by the usual clinical laboratory techniques.

The quantitative technique led to the isolation of pathogens in all 20 patients whereas the conventional qualitative technique led to isolation of pathogens in only 7 out of 18.

The initial quantitative cultures prepared from sputum taken on admission uncovered predominant colonies (minimum of 10^7 per ml of sputum) of *D. pneumoniae* in seven patients, *H. influenzae* in eight, predominance of both of these pathogens in three, and *Staphylococcus aureus* in two. They also uncovered colonies of other microorganisms in

J. Kin Pirtle, MD; Patrick W. Monroe, MD; Tim K. Smalley, MD; John A. Mohr, MD; and Everett R. Rhoades, MD. *American Review of Respiratory Disease*, December, 1969 (Vol. 100).

fewer numbers, including *S. viridans,* Candida, and Neisseria.

Quantitative culturing uncovered "superinfection" from gram-negative organisms in seven patients. In the present study, superinfection was arbitrarily designated as the presence of 10^5 per ml or higher concentrations of microorganisms other than *S. viridans* and Neisseria. In these mixed infections there were actually three times as many superinfecting organisms as all other organisms combined.

PATHOGENS OR CONTAMINANTS?

Other investigators have noted that mechanical homogenization without mucolysis increases the sensitivity of sputum cultures. As has already been noted, quantitative culturing uncovered pathogens in all 20 patients.

A number of factors appear responsible:

In the present study, smaller colony counts of common pharyngeal flora, which more uniform sampling permits, provided a reliable guide for differentiating lower-tract pathogens from contaminating pharyngeal flora.

Actually, the sample plated by routine methods constitutes a very small portion of a sputum specimen. Identification of the predominant organisms is necessarily limited to the microorganisms therein. This problem of adequate sampling may be the most important source of error in routine cultures.

Homogenization overcomes the problem in providing culture samples of different portions of a single specimen. Other workers have shown that *D. pneumoniae, H. influenzae,* and *S. aureus* are not always isolated more frequently from purulent than from mucoid portions of sputum.

Previous studies reveal that a much greater yield of *H. influenzae* is obtained from saline-washed sputum than unwashed specimens from the same patients. Apparently, inhibitory factors are removed or destroyed by the washing procedure. In the quantitation procedures, saline diluting solutions appear to have a similar effect.

One study revealed that a combination of *N. catarrhalis* and mucin inhibited *H. influenzae* growth in unwashed sputum, while the liquefying agent, N-acetylcysteine, promoted its recovery. In addition, relatively slow growing *D. pneumoniae* and *H. influenzae* in diluted sputum are not as easily masked by faster growing organisms, such as gram-negative bacilli.

Quantitative sputum analysis provides information as to whether new organisms appearing in the sputum are responsible for true superinfection. When colony counts are low (10^5 or less), use of more toxic antimicrobial agents is usually less urgent than when this information is not available. If the colony count is high, clinical evidence of superinfection will develop in 30% to 50% of these patients. Quantitative analysis also reveals pertinent information concerning the efficacy of antibacterial therapy and a better understanding of the cooperative, competitive, and antagonistic interactivities of bacteria.

The high incidence of *H. influenzae* and *D. pneumoniae* in sputum from pneumonia patients in this study may have been related to the high incidence of underlying lung disease. These are the two most common pathogens associated with exacerbations of bronchial infection in patients with chronic lung disease. Colonization of at least one of them was found on admission in all but two patients who were also found to have chronic lung disease, suggesting that chronic lung disease is common in patients admitted with pneumonia.

There appeared to be significant correlation between elevated bacterial colony counts and the presence of clinical disease. Quantitation culture procedure was found to be rapid and simple and yielded consistent results. Further studies of larger numbers of patients are needed to define more precisely the concentrations of organisms in the sputum that may be significant in various circumstances.

The Johns Hopkins Hospital Alcoholism Unit: Half-Way House and In-Hospital Treatment

SHARI MAYER
Editor
Under The Dome
The Johns Hopkins Medical Institutions
Baltimore

Traditionally, alcoholics have been regarded as nuisances by the public, the courts, and the medical profession. As it becomes clearer that alcoholism is a disease—a complex behavioral problem with extensive medical and social consequences—moral attitudes are being replaced by treatment-oriented attitudes.

Beginning January 1969, The Johns Hopkins Hospital began to form a two-phased alcoholism program sponsored by the Office of Health Care Programs. The program is under the direction of Dr. Torrey Brown, associate director of health care programs for East Baltimore, and Dr. Anthony Reading, administrator for the psychiatric liaison service.

The in-hospital phase for alcoholics who also have acute medical problems provides "on-the-spot" alcoholism counselors in the emergency department and on call through the hospital.

First Half-Way House

The other segment of the program is an alcoholism recovery unit (Flynn Christian Fellowship House) located on Gay Street, which is sponsored by a grant from the Maryland State Department of Mental Hygiene.

Although hospitals throughout the state have alcoholism counselors available to patients, The Johns Hopkins Hospital is the first in Maryland to incorporate a half-way house in its treatment of alcoholics.

Since Flynn opened, 31 male alcoholics have been treated there with only two patients needing readmission, according to Ellen Siegel, nurse coordinator for the two programs. Many more have received counseling or have been admitted to the hospital.

Key Is Self-Motivation

"Through the counseling, such as initial counseling, individual counseling, and group therapy, the men become personally motivated to stop drinking," she said. "That's the key—no one can decide for the alcoholic. He must decide for himself to stop."

Miss Siegel is assisted by Nancy Lowe, who is the chief alcoholism counselor for the hospital program, and by James Smith, chief counselor at Flynn House. In turn, there are four full-time counselors at Flynn House and two trainees from the Baltimore City Alcoholism Center at the hospital. The trainees, working under Mrs. Lowe, rotate through the hospital program every two months.

Alcoholics are usually brought to the emergency department by the Baltimore City Police Department. Under a new law, alcoholics are no longer sent to jail. They must be treated at the nearest hospital emergency room, and, according to Dr. Reading, the neighborhood around the hospital has one of the highest alcoholism rates in the country.

Reprint Permission granted by UNDER THE DOME *—A publication for the employees of The Johns Hopkins Medical Institutions, September, 1969, Baltimore.*

Once inside, the patient is able to see a counselor without being admitted or registering. Here, he is told of the hospital's program and of other agencies which can help him.

Once the alcoholic decides to join the program, he registers and is seen by the medical resident in the emergency department. All candidates for Flynn House must have a physical examination and are treated at the House.

Counseling Helps

If a patient also has an acute medical problem, he is admitted as an inpatient. In addition to regular medical care, he is visited daily by a counselor. Through these daily sessions, the alcoholic learns about vocational rehabilitation and about the variety of social services available to him through the hospital's department of social work.

Upon discharge, most patients choose to spend a week at Flynn House and return to the hospital as outpatients for further counseling and psychiatric evaluation.

An Alcoholics Anonymous group also meets weekly in a room located in the Woman's Clinic.

Since Flynn House serves only male alcoholics, women with similar problems are admitted to the hospital, when necessary, and are then referred to other half-way houses in the city which are designed for them.

As in any new service program there are problems, according to Dr. Reading. The people presently available are able to deal with only a fraction of the needs of the alcoholic patients who use the hospital. But it is a beginning, and gradual expansion is planned, particularly regarding the hospital's community medicine and community psychiatric activities in East Baltimore.

People seeking further information about the program should contact either Mrs. Lowe or Miss Siegel, ext. 3800, or the Office of Health Care Programs, ext. 6553.

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

Treating atrophic vaginitis complicated by infection... **is as easy as AVC/Dienestrol**

Dienestrol helps restore estrogen-deficient vaginal mucosa.
It is the *particular* ingredient in AVC/Dienestrol that improves cell maturation counts[1,2] — helps stimulate the restoration of normal vaginal epithelium to resist infection.

Two recent studies reconfirm AVC/Dienestrol efficacy.[1,2] AVC/Dienestrol is proven effective against monilial, trichomonal, nonspecific bacterial vaginitis, and mixed infections.[1,2] AVC/Dienestrol combats infection, helps restore tissue resistance to reinfection.

So even in complex cases, the treatment can remain the same. Comprehensive. Effective. Easy as AVC/D.

Contraindications: Known sensitivity to sulfonomides; diognosis or familiol history of corcinoma of the genitol tract or breosts; precorcinomatous lesions of the vagino or vulva; palpable uterine fibramyomo; mommory fibraodenomo; depressed liver function.

Precoutions/Adverse Reactions: The usuol precoutions for topical ond systemic sulfonamides should be observed because of the possibility of obsorptian. Burning, increosed locol discomfort, skin rosh, urticario or other monifestations of sulfanomide toxicity or sensitivity ore reosons to discontinue treatment. The use of AVC/Dienestrol does not preclude the necessity for coreful diognostic meosures to eliminate the possibility of neoplosio of the vulvo or vogino. Manifestations of excessive estrogenic stimulotion through dienestrol obsorption may occur. These include uterine bleeding, breost tenderness, exocerbotion of menstrual irregularity ond provocotion of serious bleeding in women sterilized becouse of endometriosis. Endometriol withdrowol bleeding moy occur if use is suddenly discontinued.

Dosage: One opplicotorful or one suppository introvaginolly once or twice daily.

Supplied: 'AVC/Dienestrol Creom'—Four ounce tube *with* opplicotor. 'AVC' ond 'AVC/Dienestrol Suppositories'—Box of 12 *with* opplicotor.

DOUGLAS G. CARROLL, MD, EDITOR

rehabilitation notes

Pressure Sores—Their Cause, Prevention, and Treatment

ALEXANDER S. DOWLING, MD
Medical Director, Chronic Disease Hospitals of Maryland State Health Department
Associate Professor of Preventive Medicine and Rehabilitation
University of Maryland School of Medicine

Injury to the spinal cord is a catastrophic event often made more difficult for the patient to endure because of preventable complications. Among these, with a high rate of incidence, are pressure sores which not only prolong hospitalization but may subtract substantially from the individual's eventual rehabilitation. Such sores inevitably impose an additional burden of frustration and despair upon the patient, add to the cost of his care and, at times, initiate a series of events that ultimately leads to death. It is a sad commentary upon contemporary management of spinal cord injured patients that so few escape this complication. The fact that some do escape is substantial evidence that observance of a few basic rules by both patient and those caring for him should prevent the vast majority of skin breakdowns.

Cause

As Griffith [1] has pointed out, "decubitus ulcer" is really a misnomer since "decubitus" means "lying down". Many ulcers do result from the patient lying in one position too long. However, others arise from sitting, and some even result from prolonged standing on tilt boards or electric circle beds. As long ago as 1853, Brown-Sequard [2] recognized that pressure is the prime factor causing this complication. It follows then that a more precise and meaningful term is "pressure sore" since prolonged pressure is the basic cause. Inasmuch as the spinal cord injured patient has little or no local discomfort from prolonged pressure applied to tissue between a hard, unyielding surface and underlying bony structures, he is particularly vulnerable to this type of injury.

The sites most frequently involved are those with bony prominences immediately underlying the skin. Depending upon the lying position, the sites commonly affected are the skin over the sacrum, greater trochanters, anterior iliac spines, patellae, malleoli, shins, heels, and rib cage, as well as the spinous processes of the vertebrae. In the sitting position, the ischial tuberosities and, in the standing position, the heels and soles of the feet are vulnerable areas. Pressure sores may occur entirely independent of position such as those produced by pressure from plaster casts.

Prolonged pressure unrelieved by change of position leads to tissue anoxia and capillary thrombosis. Cells deprived of essential oxygen and nutrients die. The resulting necrosis may be superficial and involve a relatively small area in thickness; at the other extreme, all tissues down to underlying bone may lose their viability. Often the surface appearance gives little indication of the ultimate size of the sore, but early evidence of serious damage is heralded by two signs—skin redness which does not blanch on pressure, and the formation of a vesicle. The former sign is due to capillary thrombosis following endothelial injury and the latter is due to extravasated tissue fluid, since normal fluid and electrolyte equilibria are destroyed as soon as cell death occurs. Ulceration of the vesicle follows and this, in turn, opens the way to infection. With tissue anoxia con-

tinuing, infection tends to spread widely and rapidly to involve muscles, tendons, fasciae, and eventually bone, unless drainage is free and the causative pressure is relieved. Cultures of this purulent drainage show a wide variety of gram negative and gram positive organisms including staphylococci, streptococci, E. coli, P. vulgaris, klebsiella, and pseudomonas aeruginosa and, on occasion, clostridium perfringens.

Although pressure is the primary cause of tissue breakdown, a number of conditions play important contributory roles. Among these are malnutrition, anemia, incontinence of bowel and bladder which leads to skin maceration and bacterial contamination, mental apathy, and lack of voluntary movement. These contributory factors have been used as a basis for the clinical scoring of patients and serve as a means of identifying those most apt to develop pressure sores.[3]

Although this scoring system was originally introduced as a predictive aid on a geriatric service, we have found its application to spinal cord injured patients a helpful device in drawing attention of personnel to the importance of alleviating threatening contributory factors. The high score of 15 represents maximum potential for developing a pressure sore, a score of 0 minimum potential.

CLINICAL SCORE

A. General Condition	B. Mental State	C. Activity	D. Mobility in Bed	E. Incontinence
0 Good	0 Alert	0 Ambulant	0 Full	0 No
1 Fair	1 Confused	1 Walks with help	1 Slightly limited	1 Occasional
2 Poor	2 Apathetic	2 Chairfast	2 Very limited	2 Usually of urine
3 Bad	3 Stuporous	3 In bed all day	3 Immobile	3 Doubly incontinent

The advantages of such a "predictability scoring system" are:

1. It is simple to use and easily understood.
2. A score of "7" or more indicates extra care must be taken or skin breakdown is likely.
3. Rescoring at regular intervals may indicate a need for an increased degree of vigilance or even a change in nursing management, as a patient's clinical condition improves or worsens.

Second in importance only to prolonged pressure as a cause of tissue breakdown is the application of a shearing force which will disrupt the continuity of tissues and lead to necrosis. This type of injury occurs when pulling a patient across a bed instead of lifting him, or sliding him in transferring him from bed to wheelchair so that the skin and subcutaneous tissues are pulled taut and overstretched. At first the damage may appear slight—an abraded, raw surface with an underlying ecchymotic area—but experience has shown that even with meticulous care, deep ulceration may ensue since tissue injury has already occurred. In contrast to prolonged pressure where time is a measurable factor, shearing forces produce their damage more or less instantaneously because it is the immediate disruptive effect of the shearing force itself on tissue that causes the harm.

Prevention

There are many ways to avoid or mitigate the effects of prolonged pressure. The simplest and most effective, but by no means always the easiest, is a change in position. Even during sleep, we normally move many times; observers report major limb or body movements about every 20 minutes. For the spinal cord injured patient who cannot move himself there are available a number of devices that either move him or effectively reduce the pressure on tissue in vulnerable areas. For many years **orthopedic turning frames** such as the Stryker and Foster Frames have been used; properly padded with pillows and turned at two-hour intervals, skin breakdown can be avoided. **Alternating pressure mattresses** have helped patients who could not be turned, but with these we have experienced some skin breakdown, especially in thin individuals with bony prominences and meager subcutaneous tissue. In recent years the **electric circle bed** has become available. By merely pressing a button, the patient secured to the bed frame is mechanically rotated through a 180° arc, thereby being taken from a supine to a prone position, or back again. Other protective devices have included **lambskins or shearlings,**[4] both natural and synthetic. These are available in various sizes (eight square feet or more) or as smaller pads for use on the heels or elbows.

Theoretically, the **water mattress** would appear to be an excellent solution to the problem of preventing pressure sores, since fluid displacement results in a degree of weightlessness. It has been reported[5, 6] that pressures up to 70 mm Hg or more may be

exerted upon skin overlying the sacrum or greater trochanters with the patient lying supine or on his side. The minimum pressure keeping capillaries open is approximately 25 mm Hg and, at this level, is due primarily to osmotic forces acting through the capillary wall and surrounding tissues. This pressure will be maintained, even though the heart may not be beating, so long as the tissues are viable. The usual intracapillary pressure of course is higher than this, being approximately 40 mm Hg. Thus, it follows that pressures acting from the outside above this level produce ischemia. By "floating" a patient in a water mattress, less pressure is exerted upon the dependent parts of the body with the result that pressures of 50 to 70 mm Hg have been observed to be replaced by pressures of 15 to 20 mm Hg or slightly higher. We have had no experience with the water mattress so we cannot report on its practical value in actual use.

Various **flotation pads** are also available. The Stryker Flotation Pad is a dry gel which simulates body fat in consistency, provides for even distribution of weight, and minimizes the effects of shearing forces that might occur. The Bio-Float Pad employs a foam type of filling encased in a waterproof cover to which a considerable quantity of water is added. This has proven useful for wheelchair seat use over a cut-out seat board, as well as for bed use. The Stryker pad also can be used in both bed and wheelchair.

Self-adherent polyurethane foam dressings have proven especially valuable. Available as Reston self-adhering foam pads from the Medical Products Division of the 3M Company, they are supplied in boxes of ten pads of polyether urethane foam measuring 8½″ x 11″ x ½″. One side of the pad is coated with an adhesive backing which is chemically inert and nonallergenic. According to Line [7] "When adhered to normal, intact skin and kept dry, the foam pad can remain indefinitely without injury to the skin. Reston has been kept in place, secured further by Micropore surgical tape, for as long as eight weeks. If the Reston becomes damp and remains so, maceration and ulceration of the skin can occur quickly. However, when the material is exposed to the air to facilitate quick drying, maceration under the Reston will not take place. Therefore, it is an important nursing measure to maintain the dryness and thus the effectiveness of the Reston."

To summarize briefly, prevention of pressure sores requires:

1. Turning the patient every two hours, thereby relieving pressure over bony prominences;
2. Prophylactic padding of pressure areas;
3. Keeping the skin clean and dry;
4. Correcting nutritional deficiencies, particularly of protein and iron:
5. Maintaining constant vigilance for effects of pressure on the skin of paralyzed or comatose patients;
6. Avoiding wrinkles in bed linen upon which the patient lies;
7. **Never** sliding a patient, since the shearing effect may be as harmful as prolonged pressure.

It has been our practice that any patient showing redness of the skin that does not fade promptly should be grounded until the reddened area is restored to normal color. Light massage to such reddened areas several times a day, plus scrupulous attention to details of skin cleanliness, as well as protection from further pressure on the area, may well spell the difference between a few days in bed or several months healing a resultant ulcer.

On repeated occasions, we have been impressed by the difficulty of preventing pressure sores when bony prominences underlie skin with little intervening subcutaneous tissue. The ischial tuberosities, the sacrum, and even the greater trochanter of the femur vary considerably anatomically and, in many patients with spinal cord injuries, it is a foregone conclusion that these variations may cause trouble. As a consequence we have suggested, and on occasion patients have accepted, prophylactic radical ischiectomies, coccygectomies, and removal of sacral prominences. This is an area of preventive care that we believe has great potential in terms of improving patient morale, shortening hospital stay, and reducing medical expense.

Treatment

Since many spinal cord injured patients reach us with one or more areas of tissue necrosis already an established fact, we are prepared to treat them as follows. The paraplegic or quadraplegic patient is placed on an orthopedic turning frame and a two-hour turning schedule started. The necrotic tissue is surgically debrided as soon as possible, cultures taken, and an enzymatic debriding agent applied. We prefer a sterile ointment containing 10% papain, 10% urea, and 0.5% chlorophyll in a solution of a borate buffer with a pH of 6.2 (*Panafil*).[8] This ointment is applied generously; thick dressings are placed over the area and held in place with elastic bandage and changed daily. This ointment is also available without chlorophyll (*Panafil-White*). Other enzymatic agents such as fibrinolysin and desoxyribonuclease (*Elase*), streptokinase-streptodornase (*Varidase*), and trypsin (*Tryptar*) are available but, being of animal origin, are much more expensive and their use in our hospital has been limited to small or shallow ulcers. Daily cleansing with hydrogen peroxide irrigation followed by sterile saline irrigation and *Panafil* is continued until the ulcerated area is clean—usually within 7 to 14 days.

Following debridement, antibiotic preparations are used depending on the result of sensitivity tests from the cultures taken at the time of admission. Usually, Polymyxin B-Bacitracin-Neomycin (*Neosporin* ointment or powder), or genta-micin ointment will be one of the agents indicated by the laboratory results and all have proven valuable. It has been our practice to continue with one agent for 10 to 14 days and change to another in order to avoid the development of resistant strains. For ulcers that are indolent with slow healing, packing the ulcer with granulated sugar or urea crystals has at times stimulated healing. It is well not to use sugar so long as to dehydrate the tissues. A week to ten days of sugar, then a change to urea crystals for a similar period, and then iodoform gauze packing for ten days is an effective cycle which may be repeated as often as needed. On occasion we have used ultraviolet light but our enthusiasm for this modality is not as great as that of some of its proponents, although on occasion, we have seen apparent benefit from its use. For ulcers involving the ankle or foot, whirlpool hydrotherapy not only helps clean the ulcerated area, but also stimulates healing.

To speed epithelization of a clean but large ulcer, and with the surface showing a pH of about 7.4, split thickness skin grafts may be applied. Another technique, using thin strips of sterile plastic tape placed across the ulcer and held in place by a previous application of tincture of benzoin compound to the skin surrounding the ulcer provides a bridge-like structure along which epithelium may grow.

Once healing is accomplished, the area may continue to present problems of recurring breakdown, scarring, retraction, and adhesion to underlying bone. Excision of the scarred area with replacement by a full thickness skin graft has been a satisfactory answer in many instances. Before proceeding with surgery, our policy has been to allow the ulcer to heal completely. This minimizes the chance of infection with loss of the graft and the disappointment that this entails to all concerned. At the time of operation, bony prominences are excised in an effort to produce a smooth weight-bearing area without protuberance. In the case of ischial tuberosities, the ischia are resected generously and primary closure effected. Many of these patients have large bursae which must be completely removed if future trouble is to be avoided. Large defects over the sacrum can be covered by full thickness grafts swung medially and, if necessary, resultant defects over nonweight-bearing areas can be epithelized with split thickness grafts. In the case of scar tissue adhering to the greater trochanter, removal of the greater trochanter is indicated along with excision of the adherent scar tissue followed by primary closure.

Postoperative care is extremely important. Patients with full thickness grafts over the sacrum and lower back and buttocks are kept face-down on an orthopedic turning frame from four to six weeks with only occasional turning face-up after three weeks. Suction at time of operation to remove blood from under the graft, or later, if a hematoma should form, is important. If the graft has a wide enough base and an adequate blood supply, the suture line should not be disrupted and healing should proceed uneventfully even though a hematoma does develop and needs evacuation. The area must be kept clean and free from fecal contamination; the sutures are removed after two to three weeks. Patients are turned face-up for one hour at meal times, great care being taken not to disturb the graft and avoiding any shearing force being exerted upon it. We have seen one patient following discharge from the hospital who developed new pressure sores involving adjacent areas but the previously grafted site remained intact.

Conclusion

Although reparative procedures are available and results oftentimes most gratifying, **prevention** of pressure sores must play a prominent role in any program that hopes to rehabilitate the quadraplegic and paraplegic patient in the shortest possible time with the least emotional trauma and at minimal expense. Here especially is it true that "an ounce of prevention is worth a pound of cure".

I wish to express my gratitude to members of our Nursing Service and especially to the "Treatment Room Team" of Montebello State Hospital: Mrs. Betty Lou Bolties, RN, Mrs. Alice C. Lingner, LPN, Mrs. Joyce C. Seabolt, LPN, Mrs. Hermione Presbury, and Mrs. Doris G. Muldrow who have treated so successfully literally hundreds of pressure sores. They have done more than just dress ulcers—they have contributed cheerfulness and instilled hope into patients who needed both. Much that I have learned about the management of this vexatious problem was learned through working with them.

Hans R. Wilhelmsen, MD, has performed many plastic repair operations on our patients and to him we owe a large debt of gratitude for what he has taught us in the surgical prevention and treatment of pressure sores.

"What she really needs, Doctor, is a shot of penicillin."

Maybe. Maybe not. In any case she needs something to control her sneezing, watery eyes and runny nose. And for most children over six, Novahistine® LP can be depended on to provide fast relief from summer colds and allergy. These continuous-release tablets have a vasoconstrictor-antihistamine formulation that begins working in minutes, then continues to provide relief for hours. A single Novahistine LP tablet, morning and evening, can keep most young patients free of symptoms all day and all night. Use with caution in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

Novahistine® LP decongestant

(Each tablet contains 25 mg. of phenylephrine hydrochloride and 4 mg. of chlorpheniramine maleate.)

DOW THE DOW CHEMICAL COMPANY Rx Pharmaceuticals Indianapolis

Clinical Extension of a pure Smooth Muscle Relaxant

TROCINATE®

Brand THIPHENAMIL HCl

400 mg./100 mg. S/C tablets

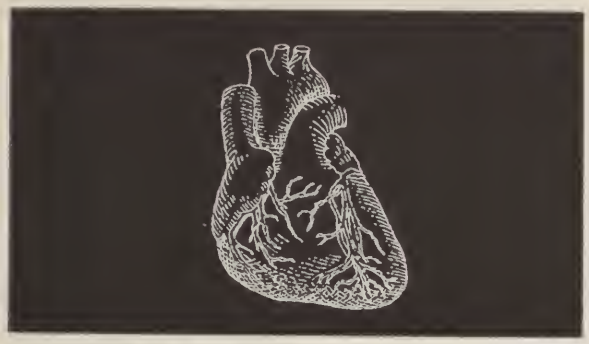
Trocinate relaxes all smooth muscles. Its direct action (musculotropic) does not involve the autonomic nervous system and it is not mydriatic. It is metabolized by the body and eliminated in the urine as harmless degradation products. Trocinate has a remarkable history of freedom from side-effects.

When a pure direct-acting smooth muscle relaxant is indicated, Trocinate is the drug of choice.

DIARRHEA (functional) . . . *the first 400 mg. tablet usually relieves the discomfort of diarrhea so promptly that it ceases to be a bother.*

DIVERTICULITIS—MUCOUS COLITIS . . . *the accompanying discomforts can be relieved by this direct smooth muscle relaxant.*

BLADDER SPASM . . . *relaxation is immediate. One or two tablets condition the bladder for cystoscopy in one hour.*



SPASTIC URETER . . . *the specific relaxing effect of Trocinate on the spastic ureter has been proven by animal studies and affirmed clinically. (J. Urol. 73:487-93)*

NOTE: *The high therapeutic index of Trocinate permits its administration in dosage sufficient to relieve smooth muscle spasm promptly. 400 mg. dosage usually creates a therapeutic blood level. In reducing dosage after relief, lengthening the time between dosage rather than lessening the recommended dose is preferable. The prompt direct action allows a consciousness of the first suggestion of return of symptom . . . a guide to dose spacing and to determining when treatment is complete. A prescription for twelve or sixteen 400 mg. tablets will usually correct spasm and leave a few tablets for a reserve.*

PRESCRIBING INFORMATION

WARNING: Do not give in advanced kidney or liver disease. PRECAUTIONS: Trocinate relaxes all smooth muscles. Large dosage or prolonged usage may cause feeling of weakness or can theoretically precipitate gall-bladder colic, due to relaxing the vascular and duct systems. Caution should be observed in patients with urinary bladder obstruction. DOSAGE: 400 mg. May be repeated in 4 hours. After relief, lengthen the dose frequency. (see side note)

Heart Disease in Pregnancy

LUIS F. GONZALEZ, MD
Baltimore

Heart disease in pregnancy is best understood by considering the potential difficulties associated with a variety of congenital and acquired heart lesions superimposed on the physiologic changes that accompany pregnancy.

Dr. John Quincy Adams, among others, has pointed out that a peak in cardiac work-load occurs in the 28th to 30th week of pregnancy, at which time it is approximately 30% above the nonpregnant level. For reasons which are far from clear, the cardiac work-load, which is determined for the most part by the cardiac output, returns rapidly to the nonpregnant level around the 36th week, where it remains until delivery. Immediately after delivery there is another abrupt increase in cardiac output of approximately the same magnitude as the first peak, and a return to normal over the next two weeks. Ueland and co-workers indicated recently that changes in cardiovascular dynamics at labor and delivery cannot be satisfactorily explained, but a common factor appears to be a redistribution of blood volumes.

The normal physiology of pregnancy can be distorted in the cardiac patient in various ways, but a common denominator in several of these cases is congestive heart failure. Congestive heart failure is the most serious complication of pregnancy in cardiacs, and the most frequent cause of death. It is most frequent in cardiacs who become pregnant after age 35, and worsens sharply after the fifth month of pregnancy, with progressive worsening in the eighth and ninth month. It rarely manifests itself for the first time during labor except in congenital heart disease. In Goremberg's Series, one notes that in 77 cases of congestive heart failure, 80% developed before the last month of pregnancy. Schenker has pointed out that at Hadassah Hospital congestive heart failure in the first trimester of pregnancy is considered a reason for therapeutic abortion.

The diagnosis of heart disease in pregnancy can be related to heart disease diagnosed prior to the pregnancy, or to signs and symptoms of heart disease first noted subsequent to the pregnancy. Signs and symptoms usually increase in magnitude as the pregnancy progresses. The meaning of these signs and symptoms and of their increase in magnitude must be reevaluated repeatedly. Murmurs are a most controversial point. Hockstein at Cornell University has recently reviewed this problem. He points out that the first and second heart sounds are normally accentuated because of the hyperkinetic state and tachycardia. At times the accentuated first sound may be confused with mitral stenosis. An increase in the intensity of the pulmonic sound is associated with an increased force and rate of closure of the pulmonic valve. A third heart sound in early diastole is often associated with increased blood flow from the atria to the ventricles.

Innocent pulmonic systolic murmurs are associated with increased blood flow across the pulmonic valve, and may be associated with hypervolemia and increase in cardiac output. These murmurs must be distinguished from aortic stenosis and its variants, from interatrial septal defect, from pulmonic stenosis, and from anomalous drainage of the pulmonary veins.

Innocent supraclavicular arterial murmurs are usually heard on the right side, and over the carotid vessels. They can be confused with murmurs of aortic or pulmonic stenosis. They disappear when the patient moves her shoulders posteriorly while one listens at the supraclavicular fossae.

Innocent diastolic murmurs are usually maximal over the pulmonic area, occur early in diastole, are blowing in quality, and are of short duration like the Graham Steell murmur. They are believed to be

associated with dilatation of the main pulmonary artery. It has been pointed out in a study at St. Luke's Hospital in St. Louis, Missouri, that 18% of prima gravidas free from detectable heart disease develop such early diastolic murmurs.

Venous hums are usually continuous murmurs with diastolic accentuation, are maximum in the lower anterior neck in the supraclavicular area and are associated with increased blood flow in the internal jugular veins.

Mammary souffles are usually noted during the last two trimesters, and usually disappear after the completion of the pregnancy. At times they first appear in the postpartum period, and during lactation are associated with engorged mammary veins. Because they may be systolic in timing or have a continuous blowing quality they must be distinguished from patent ductus arteriosus and A/V fistula.

Heart disease in pregnancy can be related to previous rheumatic lesions, congenital heart defects, thromboembolic phenomena, vascular catastrophes, myocardial infarctions, and myocardiopathies. As noted at the beginning of this discussion, the common denominator in these disorders is usually congestive heart failure.

The subject of arrhythmias has been reviewed by Mendelson, and of special interest is heart block. Congenital heart blocks were considered benign because of the lack of associated myocardial or valvular damage in contradistinction to acquired heart block. If asymptomatic the patient should be left alone, but if necessary a pacemaker may be used during delivery.

Knapp and Arditti at Cornell University pointed out that the incidence of heart disease in pregnancy decreased from 3.2% in 4,366 pregnancies evaluated in 1953, to 1.6% in 5,080 pregnancies evaluated in 1965. This decrease was explained almost entirely by a decline in the cases of rheumatic heart disease. In 1953, 88% of heart disease noted in these patients was rheumatic in origin, whereas in 1965 only 5% was rheumatic. The number of cardiac patients requiring therapeutic abortion declined from 12 in the period 1953 through 1959 to two patients in the period from 1962 to 1965. From 1953 through 1959, 23 patients with rheumatic heart disease underwent a mitral valvotomy during pregnancy, as compared to three in the period from 1962 through 1965.

From the Cornell data, the following have been considered indications for surgery: those patients in the first and second trimester with predominant mitral stenosis and progressive cardiac disability; those patients with mitral stenosis refractory to medical treatment; and Class III and IV patients with mitral stenosis who become pregnant. Probably the most ideal time for performing cardiac surgery is between the 18th and 24th week of pregnancy.

Interruption of a pregnancy in a patient Class III or IV prior to six months gestation may be justified particularly if the patient is unable or unwilling to remain at bed rest during pregnancy. Pudendal block or local perineal infiltration is considered satisfactory and safe; spinal and saddle block are best avoided because of the danger of decreasing blood pressure.

In some medical centers the indications for mitral valvotomy are the same as those for the nonpregnant cardiac. At Hadassah University, these indications are progressive heart failure which does not respond to conservative therapy while the patient is hospitalized, mitral stenosis with recent thromboembolism, and pure mitral stenosis.

Acute cor pulmonale in pregnancy has been extensively reviewed by Mendelson. Cor pulmonale refers to right ventricular enlargement with or without heart failure, secondary to intrinsic conditions of the lungs or pulmonary circulation, or both. The first signs of cor pulmonale may include a complaint of tightness of the chest, onset of or increase in the accentuation of the pulmonic valve closure sound, dyspnea, cyanosis, venous engorgement, and rales at the lung bases. Therapy includes rapid intravenous digitalization, oxygen inhalation, tourniquet phlebotomy and aminophylline. Acute cor pulmonale may develop following intraluminal embolic pulmonary vascular obstruction due to thrombus, air, fat, fibrin, or amniotic fluid.

In thromboembolism, serious circulatory disturbances develop only after obliteration of more than one half of the cross sectional area of the pulmonary vessel. Cardiac output then decreases if myocardial ischemia occurs. Electrocardiographic abnormalities may include right axis deviation, right bundle branch block, ischemic ST-T changes, prominent Q waves in lead 3, and inversion of T waves in leads V2 and V3. X-ray of the chest may show a characteristic triangular or truncated shadow. The incidence of pulmonary embolization in pregnancy is increased in sickle-cell anemia, sickle-cell hemoglobin C disease, polycythemia, heart block, atrial fibrillation, and bacterial endocarditis.

The cardiac manifestations of the toxemias of pregnancy have been described in detail by Dr. J. Swarthwout at Emory. Basically, in preeclampsia there is an increase in the peripheral vascular resistance; the heart must work harder to pump the same amount of blood per unit of time; the pump reaches its mechanical limits and fails. Prevention of heart failure includes reduction of the peripheral vascular resistance (via vasodilators, termination of pregnancy, reduction of blood volume, correction of anemia, prevention of rapid intravenous infusion of fluids, etc.) reduction in muscular efforts and prevention and treatment of arrhythmias and respiratory problems.

Myocardiopathy, although incompletely understood, is a most interesting type of heart disease in

pregnancy. Numerous descriptive names have been applied to include "idiopathic, myocardial degeneration associated with pregnancy and especially the puerperium" (Bellet); "toxic post partal heart disease", (Hull); "idiopathic myocardial failure in the last trimester of pregnancy and the puerperium", (Meadows); and many others. It should be understood however that there is no agreement as to whether or not there is such an entity as "myocardiopathy of pregnancy".

Friedberg suggests classifying as post partal heart disease only those cases which have had no previous history of heart disease or heart failure, before, during, or soon after delivery. Gilchrist describes two different groups of cardiomyopathies in pregnancy and puerperium. One group presents with congestive heart failure; the other with angina and tachycardia. Whereas in the first group the patients are symptom-free within years, in the angina tachycardia group the patients have protracted symptoms.

In a review of the obstetrical histories of 15 patients with cardiomyopathies, Brown and co-workers doubted that a cardiomyopathy of pregnancy really existed as a separate entity, although they considered the possibility of one case in their series as possibly representing a myocardiopathy of pregnancy. A group of nine cases of heart failure occurring for the first time in the last trimester of pregnancy or in the puerperium was evaluated by Nagaratiam and co-workers in Ceylon. The data suggested to the authors that heart disease in the last trimester of pregnancy is a distinct clinical entity, ie, a cardiomyopathy of pregnancy. Five of the nine patients were young women (20 to 30 years), seven were multiparous, five of whom had seven or more pregnancies. Their symptoms began from eight days before to eight weeks after delivery, and three patients developed a transient elevation of the diastolic blood pressure in excess of 100mm/Hg. The ECGs revealed nonspecific T wave inversion in eight of the nine patients. The age group in this specific series is in contrast with that of Crisp and coworkers who had emphasized an older maternal age. This type of heart disease in pregnancy is one which obviously needs further evaluation in order to establish it as a specific entity associated with pregnancy.

There are numerous types of heart disease which pose potential complications to pregnancy. Also, numerous murmurs of little or no significance can be readily misinterpreted in a pregnant woman. In view of these facts and the recent advances in surgical techniques and the ready availability of modern surgical procedures, it is important to all who evaluate pregnant women to consider the points raised herein.

Baltimore City health department

Highlights

Child Lead Paint Poisoning Alert

All physicians in Baltimore city are urged to be alerted to the possibility of lead poisoning in a child with pica and vague symptoms of indigestion, nausea, headache, and general malaise. Assistance in the diagnosis of lead paint poisoning may be obtained by calling the Baltimore City Health Department, 752-2000, extension 614.

The City Health Department has issued warnings through the press, radio and television, but a physician who sees young children is in a good position to warn "high risk families" of the lead danger.

Health Department records show a total of 19 cases of lead poisoning in 1969 compared with 13 in 1968 and 15 in 1967. High point in this insidious illness was 1958 with 133 cases and 10 deaths. There has been no death in Baltimore for the past three years. Alert physicians can help maintain this record.

Rubella Campaign Report for Baltimore City

In its latest attack on disabling communicable diseases, the City Health Department reports that a total of 88,708 children in the city's public and parochial schools have received the new rubella vaccine for the prevention of German measles. This represents 75% of the total target school population of 119,034 children enrolled from kindergarten through grade 5. Considering an average absentee rate of 10%, this may be considered an excellent response.

The city-wide Rubella Immunization Program was sponsored jointly by the city and state medical societies in cooperation with the public and parochial schools, the State Department of Health, the National Foundation—March of Dimes and volunteers. Members of the City Health Department Rubella Committee include John B. Saratsiotis, MD, Chairman; John B. De Hoff, MD, Deputy Commissioner; James D. Carr, MD, Assistant Commissioner of Local Health Services; Allan S. Moodie, MD, Director, Bureau of Communicable Diseases; Miss Alice Sundberg, Director, Bureau of Public Health Nursing; Mr. Johnny Westerholm, U.S. Public Health Service Immunization Project Coordinator; and Mr. Joseph Gordon, Director, Bureau of Health Information; and Robert E. Farber, MD, Commissioner of Health.

Five immunization teams comprising physicians, public health nurses, health aides, and volunteers under the direction of Mr. Westerholm administered the rubella vaccine using high speed jet-injector guns capable of inoculating 600 children per hour. Some 230 elementary schools were covered.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

LACTINEX®

TABLETS &

GRANULES

■ **to help restore and stabilize the intestinal flora**

■ **for fever blisters and canker sores of herpetic origin**

Introduced to help reestablish the normal physiology of the intestinal tract in gastrointestinal disturbances[1], particularly diarrheas (including those resulting from antibiotic therapy), Lactinex is also useful for reestablishing the flora following bowel surgery, infant colic, mucous colitis, foul-smelling stools, pruritus ani, flatulence and hives.[2,3,4,5,6]

Lactinex contains a viable mixed culture of both *Lactobacillus acidophilus* and *L. bulgaricus* with the naturally occurring metabolic products produced by these organisms.

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

Corticosteroid therapy week after week.

then antibiotic therapy last week.

and monilial overgrowth this week.

For many patients on long-term corticosteroid therapy, the addition of oral antibiotic therapy may trigger monilial overgrowth in the intestine. When you anticipate such a problem, take action with DECLOSTATIN 300. It combines the broad-spectrum potency of demethylchlortetracycline with the antifungal effectiveness of nystatin—it helps avoid monilial take-over. Experience has shown DECLOSTATIN to be highly useful for many women patients; individual culture studies will show exactly where this usefulness may best be applied.

it doesn't let monilia begin where bacteria end.

Declostatin® 300

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units Capsule-Shaped Tablets Lederle

Effectiveness: Because its antibacterial component is DECLOMYCIN® Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose-related. Transient, reversible, nephrogenic diabetes insipidus with excessive thirst and polyuria (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: One tablet b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

maryland state MEDICAL JOURNAL

VOLUME 19 JULY 1970 NUMBER 7

CONTENTS:

State of the State's Health, Neil Solomon, MD, PhD; Matthew Tayback, ScD 48

"The recently formed State Department of Health and Mental Hygiene was established in compliance with legislation passed by the 1969 session of Maryland's General Assembly and signed into law by Governor Mandel. On July 1, 1969, the department was activated. The new department has concentrated its efforts in five major areas, all designed to better serve the health needs of people throughout the state."

Disaccharide Intolerance: A Review for Practicing Physicians, Arthur E. Cocco, MD; Gualberto C. Gokim, Jr., MD; Barbara Jane Carbary, RN 51

"It was felt that a review of the present concept of sugar intolerance would be of value to the practicing physician in his daily contact with patients.

"It is the purpose of this paper, therefore, to review disaccharide intolerance with clinical pathophysiologic clarification and dietary management."

Murine Typhus: Recent United States Surveillance and Report of an Unusual Case, Harold Mellin, MD; John B. MacGibbon, MD; Lawrence P. Levitt, MD; John H. Janney, MD 56

"The reported incidence of murine typhus (typhus fever) in the United States has been declining almost steadily for the past 15 years. The following case, which is the only one reported from Maryland in 1968, is presented as a reminder that murine typhus still occurs in the United States and may pose a difficult diagnostic problem, particularly when rash is not present."

The Role of Computers in Electroencephalographic Analysis, Antonio Stazio, MD 59

"Over the past two decades, during which the computer has become an increasingly popular tool in scientific research, much work has been undertaken in the general field of computer assisted diagnosis. To this end, however, the complexities of the problem have not permitted any great advances: A breakthrough, in fact, has occurred only in one specific area—electrocardiography (EKG).

Treatment of a Highway Accident Victim, Stuart V. Grandis, MD ... 62

A case history presented during a session of Medical Grand Rounds at the Faculty's Annual Meeting in 1969.

Acute Renal Failure, Glenn D. Lubash, MD 63

"This presentation will review the natural history of acute renal failure and illustrate therapeutic principles as they pertain to the presented case."

RUBEOLA ALERT

From January 1 until June 4, 1970, 1,245 cases of measles (rubeola) were reported to the State Health Department, as compared with 33 at the same time in 1969. During this period there were three deaths and several cases of encephalitis which could be attributed to measles. Almost all cases occurred in unimmunized children.

According to information obtained through the Maryland Infant Immunization Surveillance Program, approximately 70% of infants in the state have received rubeola vaccine by the age of two. However, in 15 of the 24 subdivisions of the state, the number of children who have received the vaccine is lower than this state average. In addition, even in those subdivisions where levels are above the state average, there are pockets of susceptible children large enough to sustain small outbreaks.

Measles vaccine (rubeola) should be given routinely at 12 months of age to all well children. The killed rubeola vaccine is no longer recommended nor commercially available. A single injection of the further attenuated measles vaccine or one injection of the attenuated measles vaccine with measles immune globulin at this age is sufficient, according to current information, to confer lifetime immunity.

RESOLUTIONS DEADLINE

Deadline for receipt of resolutions to be considered at the Semiannual Meeting in Hershey, Pa., on Friday, September 11, 1970, is

FRIDAY, JULY 17, 1970

All resolutions must be in the Faculty office by that date.

Room reservations for Hershey, Pa., should be sent directly to the Hotel Hershey. Deposits are required on all hotel reservations.

TRIENNIAL LICENSE REGISTRATION

Triennial Reregistration of licenses to practice medicine has been modified during the past two years. Those whose names begin with the letters indicated will receive their reregistration application in the years shown:

A-G 1969 H-N 1970 O-Z 1971

Physicians whose license registration has expired need not be concerned until the fall of the year indicated. Reregistration forms will be mailed prior to the registration dates.

CODES OF COOPERATION

The medical profession has developed Codes of Cooperation with other professions that spell out ethical (and sometimes legal) considerations involved in working with other professions.

An increasing numer of complaints are being filed with the Faculty by physicians against attorneys who have failed to protect the physician's fees or charges from settlements or awards granted to patients for reports and testimony.

Physicians are urged to make themselves familiar with the Medicolegal Code of Cooperation; as well as the other Codes of Cooperation. Copies of these may be obtained at the Faculty office.

An attorney may properly advance fees for medical reports, testimony, etc., in anticipation of awards to their clients. The physician must, however, look to the patient for payment of his fees for medical services.

CODES OF COOPERATION (cont'd)

In all cases, the attorney is expected to protect the physician's charges wherever possible. There is no legal requirement to do so, but most lawyers see that outstanding bills are paid to physicians from settlement funds.

Physicians may not look for payment for their medical services on a contingent basis.

RUBEOLA ALERT

Rubeola (7-day measles) has dramatically increased the first five months of 1970 with three deaths. (See elsewhere in this Journal for further information.)

PUBLICATIONS BEING PREPARED

Being prepared for the printers are the following three publications which will be available early in the fall of 1970:

1. Laws, Rules and Regulations with which Physicians Must comply.

   The updating of this publication will contain latest information, including legislation adopted at the 1970 General Assembly. In addition, it has been expanded to include the various Codes of Cooperation as well as Ethical Standards adopted by the Faculty's Council or House of Delegates.

2. A compendium of policy decisions that have been reached by the Faculty's Council and Mediation Committee over the years. This outlines ethical policies of the Faculty, and positions that should be helpful to physicians in their everyday practice.

3. 1970 Handbook (now available).

Copies of the first two publications will be mailed to all members when they are available. Additional copies may be obtained in the Faculty office.

REVISED MEDICAL PRACTICE ACT

The Revised Medical Practice Act has been signed into law by the Governor and went into effect on July 1, 1970.

While there are no substantive changes in the law, the statute elucidates certain areas which were confusing.

Admission Rates at Record Level in All Age Groups

Admission rates for all age groups to Maryland's state-operated mental hospitals increased between 1962 and 1968. That is, proportionally, admissions increased much faster than the general population. As shown in the following table, rates increased half or more in all age categories under 65, and rose at a somewhat lower percentage in the two upper age groups. During this six-year period the total admission rate increased 59.8% (from 224.4 to 358.7 per 100,000 Maryland residents 5 years of age or older). A further rise in this rate to 416.6 occurred in 1969, and it is expected to reach 430 in the current year.

AGE—SPECIFIC ADMISSION RATES*—FISCAL YEAR

AGE GROUP	1968	1966	1964	1962	PERCENTAGE CHANGE (1968 vs. 1962)
TOTAL-NUMBER	11,997	9,673	7,871	6,221	+92.8
RATE	358.7	306.6	265.6	224.4	+59.8
5-14	23.5	28.3	17.5	15.8	+48.7
15-24	281.9	230.0	193.4	166.1	+69.7
25-44	538.4	468.1	403.7	343.5	+56.7
45-64	546.2	439.2	359.5	297.8	+83.4
65-84	340.0	348.2	364.9	325.8	+4.4
85 AND OVER	846.6	771.2	612.8	694.2	+22.0
MEDIAN AGE	41.7	41.3	41.5	41.4	+0.3

** Number of admissions per 100,000 estimated Maryland residents in specified age group.*

Most other states have reported comparable data. Primarily, this upward movement reflects a growing number of admissions for short-term intensive treatment of acute nonpsychotic disturbances together with an increase in the number of patients requiring multiple hospitalizations. Schizophrenia and other psychotic disorders accounted for 33.5% of the 6,221 admissions in 1962, and 17.4% of the 11,997 admitted in 1968. During this period, admissions for disorders related to old age decreased from 11.7% to 5.4% while admissions for acute conditions, such as alcoholism, other personality disorders, and psychoneurotic reactions rose from 40.5% to 62.1%. In 1962, 43.9% of all admissions reported a previous psychiatric hospitalization. By 1968, this had increased to 58.2%. During the first nine months of the current year the rate was 60.9%.

Since half of all new admissions are now released within less than two months, and virtually all within one year, the number of resident patients has been reduced appreciably despite the rising number of admissions. In 1962, there was an average of 8,291 hospitalized patients; this decreased to 7,711 in 1968, and dropped further to 7,451 in 1969. Our estimate for 1970 is 7,150.

Mental hospitals are in a state of transition, with a gradual shift from a chronic long-term custodial population receiving minimal care to an acutely ill patient group requiring maximum, high-level professional services. Average daily expenditures per patient can, therefore, be expected to continue rising at the current rate of increase. This trend will be further accelerated with the Department's current development and expansion of coordinated community-centered services and programs.

The girth control pill

Tepanil® Ten-tab
(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic cardiovascular effects reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythema. Gastrointestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

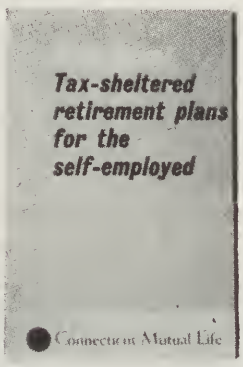
Should You Incorporate?

Maybe Yes.

The present I.R.S. position boils down to this: When you become an employee of your own professional corporation or association, a lot of good things can happen. For one thing, you may cut your income tax. For another, you can beef up your retirement investments with more tax-sheltered dollars.



After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the matter further with your attorney or tax accountant.

Maybe No.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions. And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet, "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

Connecticut Mutual Life Insurance Co.

A Volunteer Physician's Experiences in Vietnam

ANDRE FESUS, MD
Baltimore

It is amazing to me how little publicity and attention is given by the media to physicians, even when they are doing altruistic, philanthropic work. In the newspapers you see headlines about the cruelties committed by Americans in Vietnam, but very little, or nothing, about the benefits of the AMA Volunteer Physicians for Vietnam program that supplies medical care to the poor civilian population suffering from the effects of a guerilla war. During the last three years, while the program has been in effect, over 800 physicians have served for a period of two months in the provincial hospitals of Vietnam. My son, who served for one year in Vietnam as a Pacification Officer, confirmed that the AMA Volunteer Physicians for Vietnam program is the most successful program there.

We physicians are privileged people. We can come in contact with all segments of the population, in all countries of the world, and can give them our services promptly.

When I arrived in Vietnam, an Army helicopter dropped me in Vinh Long at nine o'clock in the morning; two hours later I started with the clinic; and at 2:00 PM I performed my first operation. Daily, I saw about 60 patients and performed four major operations. One third of the operations were on war injuries—metal fragments from booby traps, mortar shells, and mines. On my first day in Can-Tho we treated the survivors from a civilian bus that was mined on its way to the market, a route untraveled by military personnel—Vietnamese or American. Fourteen people were killed on the spot. Vietcong terrorists attack everywhere, especially where crowds are gathered. One Sunday I walked to the market in Vinh Long and stopped to take photos from the veranda of a restaurant on the bank of the Mekong River. While watching the crowd, which was composed only of women and children, it struck me that this would be a perfect place for a terrorist bomb. Two hours later a bomb went off at that exact spot and 12 people were killed. Twelve others were seriously injured. This is immoral war!

During the TET offensive the Hue University Medical School's German professors and their families were slaughtered by the Vietcong. The press reported very little, or nothing, about these martyrs of medical science, and no pacifist groups ever protested against this massacre. The Vietcong allege that the South Vietnam population is of communist sentiment. Why then are they systematically killing innocent children and women? The answer is clear—the communist doctrine teaches that with terroristic intimidation of the masses, the power can be seized by a well organized 3% of the population.

The Vietnamese are a friendly and warm people. They are worthy of respect. Dignity, restraint, and politeness are highly regarded, and love and respect for one's parents and elders are emphasized. The difference of one year in graduation among physicians dictates a lifelong filial respect of the younger for the older. Were that only true here!

Children everywhere are lovely, but they are particularly handsome in Vietnam. Although endemically shy, when something curious comes by, like an American, they draw closer for a better look. A great fascination is the hair on our forearms, which they like to stroke and tweak. When they are rewarded for a captivating smile by an American, they call him "Number One". When they are ignored, the American is mocked by "Number Ten, Number Ten".

The Vietnamese women are, on the average, very pretty and very slender. Unlike the flabby women of India and Pakistan who can hide their ample figures under the sari, the Vietnamese women wear

tight form-fitting blouses and hide their thin bodies with long sleeves and trousers. This national dress, the Ao-Dai, is a slit "maxi-tunic" over pants, is kept spotlessly clean and is worn everywhere, even while riding a motorbike, or when walking in muddy roads during the monsoon season. The back half of the tunic is clipped in the luggage rack and the front half is held on the handlebars of the bike. The women move gracefully in their elegant dress, whether walking in the street, planting rice in the paddyfields, or carrying an enormous weight like gallons of water.

Almost the entire male population of Vietnam has been conscripted into the army. There are 1,400 Western educated physicians. Only 400 of these are civilian physicians, who care for the population of 15 million. The rest, as well as all new graduates from medical schools, are enrolled in the armed forces.

In Vietnam, a patient first goes to see a Chinese doctor who cures everything with mysterious herbs and pinches the skin around the ailing organs, causing hematomas. Another Chinese speciality is "Acopuncture", or driving long needles through the various parts of the body. I read recently in the *New York Times* that the infallible Mao Tse Tung ordered this method to be perfected to the point where patients born deaf and dumb, upon their cure, exclaimed spontaneously, "Long live Comrade Mao".

My own exposure to Chinese medicine was less successful. One day I walked into the Can-Tho hospital and rushed to the emergency room, where I found a two-week-old moribund child with symptoms and signs of general sepsis. After two labored breaths, within a minute, the child died. (Newly-born children are wrapped in warm clothes, a custom indoctrinated into uneducated people by witch doctors.) I unwrapped the corpse and found an oozing spina bifida, large as a fist, richly covered with some dirty salve, which obviously had transmitted the infection.

Vietnamese people in the Mekong Delta are remarkably healthy. In two months I did not see any congenital ailments or overweight people. I saw one diabetic retinopathy and only two retinal hemorrhages due to hypertension—just as much as I saw in private practice as an ophthalmologist the first week I was home. I had no cases of arthritis—even old people are erect in spite of hard labor. The people in the tropics are constantly exposed to all kinds of infection, but they develop immunity to various diseases.

Hospitalization is free, but there is a constant critical shortage of hospital beds. "Semiprivate" in Vietnam means two or three patients in one bed. The shortage of beds is somewhat alleviated by the local custom of surrounding the patient with all his relatives by day. At night, his relatives take him to their home. Next morning the patient returns with his relatives to the hospital. There are model hospitals like the Rehabilitation Center in Saigon, which unfortunately is receiving more and more patients with amputated legs or those who are blind.

Vietnam has a very old civilization with roots in Asian religions and philosophies. The Vietnamese people fought for national independence from colonialism, but their modern civilization and culture is strongly under French influence. The most famous TB specialist, who is always wearing the ribbon of the highest Vietnamese decoration, awarded for his fight against the French, told me proudly, "My culture is French et j'étais capitain de l'armée francaise." When the French names of the streets in Saigon were changed or abolished, only two were saved, that of Pasteur and the other of the French missionary, a Catholic priest, who taught them the Latin alphabet.

The Vietnamese are proud people. They are fighting to preserve the freedom that they fought for 25 years ago, and which is now threatened by communism. They are not parasites. They appreciate foreign aid but, as the director of the Can-Tho Hospital said during a farewell party given for a very successful American surgeon, "We wish to be always independent, de n'importe qui, n'importe quel pays" (from no matter whom, no matter what country).

Obviously, you can tell that I had a good experience in Vietnam. In fact, I met intelligent and interesting people who were dedicated to their profession and to the liberty and independence of Vietnam. I feel fortunate that since I speak French fluently, I could establish a more intimate contact with the people than I would have otherwise.

In conclusion, not meaning to overestimate the value of the service rendered to the poor people of Vietnam, I have the moral satisfaction along with other volunteer physicians, of feeling proud of our humanitarian work which elevates us over the unpatriotic, selfish, spoiled cowards, "Sybarite" shirkers.

Fortunately, we have had no fatalities among the volunteer physicians. A few have been shot, but they recovered without being permanently wounded.

A young California colleague came to see us in Can-Tho. We took him to a pool, but he would not join us in a swim. Many weeks later we learned why he had declined. While delivering a jeep load of goods in Rach-Gia, which his wife had collected for an orphanage, he had been shot. He removed the bullet which had stuck in his ribs, and secretly dressed the wound himself to conceal the incident from his colleagues, and particularly from his own wife.

My last words are a quotation from Benjamin Franklin, whom I have admired since my youth. "I feel a better and happier man, I otherwise should have been, if I had not attempted it."

Schering

After only one year:

Administered to more people than live in Dundalk, Annapolis, and Bethesda.*

Injectable Garamycin®
brand of gentamicin sulfate injection

*An estimated 208,000 patients have received GARAMYCIN Injectable to date. The combined population of Dundalk, Annapolis, and Bethesda is 193,500. (Estimated 1969 figures from The New York Times Encyclopedic Almanac 1970.)

See Clinical Considerations section on last page...

Mounting acceptance in the hospital...

Proven clinical effectiveness

Respiratory Infections

Outstanding results in serious gram-negative respiratory infections[1,2]

GARAMYCIN Injectable may prove successful where other antibiotics have failed.

Urinary Tract Infections

Strikingly effective in selected urinary tract infections[3]

With relatively low intramuscular doses, the promptly attained levels of GARAMYCIN achieved in the urine are considerably higher than the concentrations required for effectiveness against virtually all susceptible gram-negative pathogens. (Appropriate precautions are indicated in patients with impaired renal function; consult Package Insert for full details.)

Septicemia

May be lifesaving[4-6]

Numerous investigators have drawn attention to the value of GARAMYCIN Injectable in the treatment of gram-negative septicemias, often complicated by shock. Many hospital strains of *Serratia* are susceptible.[6]

Wounds and Burns

Response may be dramatic in wounds and burns complicated by sepsis[7]

The established efficacy of GARAMYCIN Injectable against *Pseudomonas*—as well as most other gram-negative pathogens—makes it an especially useful agent in the treatment of infected wounds and burns.

Important Precautionary Note Patients receiving treatment with GARAMYCIN Injectable (gentamicin sulfate injection) should be under close clinical observation because of the toxicity associated with the use of the drug. Ototoxicity, vestibular and auditory, can occur in patients, primarily those with preexisting renal damage, treated with GARAMYCIN Injectable for longer periods or with higher doses than recommended.

GARAMYCIN Injectable is potentially nephrotoxic, and this should be kept in mind when it is used in patients with preexisting renal damage.

This drug should be limited to the treatment of serious infections caused by susceptible gram-negative bacteria, with due regard for relative antibiotic toxicity. (See Clinical Considerations section.)

Mounting evidence in the laboratory...

Schering

Over 95% gram-negative pathogens sensitive.*

No other antibiotic performed comparably *in vitro* against gram-negative pathogens.
In a nationwide culture audit of antibiotic sensitivity patterns, sensitivity reports from 106 hospitals, geographically representative by census tract and of varying sizes, were analyzed. During the three-month period, ***every*** gram-negative culture slip from ***every*** hospital was surveyed. The total number of cultures involved in the audit was 97,091. The total number of sensitivity determinations was 643,503.

*Adapted from a three-month, nationwide hospital audit by R. A. Gosselin and Co., Inc., Dedham, Massachusetts (mid-May to mid-August, 1969).[8]
Antibiotics with significant gram-negative spectra are included. Organisms are listed as reported by laboratory.
Sensitivity testing was done by the disc method, a generally reliable test in the hospital setting. It should be noted, however, that the results with GARAMYCIN were somewhat higher than the results reported where the tube dilution technique was used. (See Clinical Considerations section which follows.) The concentration of the GARAMYCIN disc was 10 mcg.
Whereas standard testing methods were used by all hospitals, it is acknowledged that in a survey of this kind considerations such as differences in methodology are possible sources of error. The comparative percentage-sensitivity results derived from a survey of this kind are, therefore, not absolute. One should keep in mind also that the proper selection of an antibiotic is based not only on susceptibility testing but on relative toxicity and other clinical considerations as well.
It is felt, nonetheless, that the broad scope of the survey and the extreme care in data collection and tabulation permit a conclusion that the results are *generally* representative of current nationwide antibiotic sensitivity patterns.

Injectable Garamycin®
brand of gentamicin sulfate injection

See Clinical Considerations section on last page...

Injectable Garamycin®

brand of gentamicin sulfate injection

ADULT DOSAGE GUIDELINES

See definitive prescribing information in Package Insert.

Patients with Normal Renal Function

Total Daily Dose (administered in two, three, or four divided doses)			
	Less Severe	**Resistant/ Moderately Severe**	**Serious/Life-Threatening**
Urinary Tract Infections (due to susceptible strains of gram-negative bacteria)†	0.8-1.2 mg./kg. for 7-10 days	Larger doses or additional antibacterial therapy should be considered in severe urinary tract infections or in resistant cases involving the renal parenchyma or anatomic anomaly.	up to 5 mg./kg.
Other Infections including bacteremia, infected surgical wounds, severe soft tissue infections, and respiratory tract infections (due to susceptible strains of gram-negative bacteria)	3 mg./kg. for 7-10 days		

†Alkalinization of the urine may be a useful therapeutic adjunct.

Patients with Impaired Renal Function

To minimize the risk of ototoxicity in patients with impaired kidney function, only the first dose should be that normally recommended. Each subsequent dose should be half or less of that recommended for patients with normal renal function, depending upon the degree of renal impairment.

In patients with renal failure who are undergoing 14-hour hemodialysis twice weekly, administration of 1 mg./kg. GARAMYCIN Injectable at the end of each dialysis period has been suggested.

Clinical Considerations

Indications: GARAMYCIN Injectable is clinically effective in infections due to susceptible strains of gram-negative bacteria, including *Pseudomonas aeruginosa,* and species of indole-positive and indole-negative *Proteus, Escherichia coli,* and *Klebsiella-Aerobacter.* Bacteriologic studies should be conducted to identify the causative organism and to determine its sensitivity to gentamicin sulfate. Sensitivity discs of the drug are available for this purpose. If the susceptibility tests indicate that the causative organism is resistant to gentamicin sulfate, other appropriate antibiotic therapy should be instituted.

IN VITRO INHIBITION OF CLINICALLY IMPORTANT BACTERIA BY GENTAMICIN SULFATE (TUBE DILUTION STUDIES)

BACTERIA	No. of Strains Tested	No. of Strains (%) Inhibited by: 4 mcg./cc. or less		8 mcg./cc. or less*		No. of *In Vitro* Studies
Staphylococcus aureus	1,210	1,200	(99%)	1,206	(99%)	11
Pseudomonas aeruginosa	885	771	(87%)	828	(93%)	16
Escherichia coli	836	736	(88%)	779	(93%)	11
Indole-positive and indole-negative *Proteus* species	477	210	(44%)	358	(75%)	12
Klebsiella-Aerobacter species	292	205	(70%)	231	(79%)	10

*Number of strains (%) of gram-negative bacteria inhibited by 10 mcg./cc. or less are as follows: *Pseudomonas aeruginosa,* 828 (93%); *Escherichia coli,* 792 (95%); *Proteus* species, 393 (82%); *Klebsiella-Aerobacter* species, 284 (97%). From same studies as above.
Source: Package Insert

This drug should be limited to the treatment of serious infections caused by gram-negative bacteria, particularly *Pseudomonas aeruginosa, Proteus* and other susceptible organisms, with due regard for relative antibiotic toxicity. Therefore, the drug should be considered for use against gram-negative: 1. Bacteremia; 2. Infected surgical wounds; 3. Severe soft tissue infections, including burns complicated by sepsis; 4. Respiratory tract infections; and 5. Selected cases of urinary tract infection.

Contraindications: GARAMYCIN Injectable is contraindicated in individuals with a history of hypersensitivity or toxic reactions to gentamicin.

Warnings: Patients receiving treatment with GARAMYCIN should be under close clinical observation because of the toxicity associated with the use of this drug. Ototoxicity, vestibular and auditory, can occur in patients, primarily those wh pre-existing renal damage, treated with GARAMYCIN Injectab usually for longer periods or with higher doses than recommend

GARAMYCIN Injectable is potentially nephrotoxic, and th should be kept in mind when it is used in patients with pre-existg renal impairment. Kidney function diminished by infection of e upper urinary tract may, however, improve during effective tre ment with GARAMYCIN Injectable.

Concurrent administration of potentially ototoxic drugs such streptomycin and kanamycin or of potentially nephrotoxic dr such as polymyxin, colistin, and kanamycin with gentamicin sul e has not been shown to afford any clinical advantages and, morec may result in additive toxicity. Monitoring of vestibular, cochl and renal function will provide guidance for therapy in such ca

Precautions: In patients with impaired renal function in wh serious infection develops, serum concentrations of the drug r rise, with consequently increased risk of ototoxicity. In these tients or in those in whom recommended dosage or duration therapy must be exceeded as a life-saving measure, routine stu of kidney function should be performed when possible. These r be supplemented by evaluation of the vestibular and auditory fu tion and measurement of serum concentration of the drug wh feasible. Serum concentrations of gentamicin should be maintai below the range of 10-12 mcg./ml. to reduce risk of ototoxicity.

Ordinarily, treatment should not be given for more than 7 to days or be repeated unless required for serious infection not sponsive to other agents.

As with other antibiotics, treatment with GARAMYCIN Injecta may occasionally result in overgrowth of nonsensitive organisms superinfection occurs, appropriate therapy is indicated.

Safety for use in pregnancy or the potential for fetal ototoxicity nephrotoxicity have not been established. Studies in pregnant a mals have not revealed teratogenic or ototoxic effects in the fe GARAMYCIN Injectable should not be used in pregnant patients in women of childbearing age unless its use is deemed advisa by the physician.

Adverse Reactions: The overall incidence of ototoxicity conside related to treatment with GARAMYCIN Injectable was 2.8 per c (16 of 565 patients). Contributory factors (two or more factors w relevant to most patients) were as follows: 10 had azotemia, received a total of 1 gram or more of the drug, 7 had recently ceived other potentially ototoxic antibiotics (streptomycin or ka mycin), and 5 were over 60 years of age. Six also had decrea high-tone hearing acuity, which returned to or toward normal the 4 patients retested.

Analysis of BUN data indicated that 4 (2%) of 172 patients sho increases in BUN that were probably related to treatment w GARAMYCIN Injectable. Of 20 increases probably or possibly rela to treatment, 7 were reversible, 9 occurred in terminal patients, a 4 had no follow-up.

Other adverse reactions associated with treatment were one insta each of urticaria, decreased hematocrit, and reversible depress of granulocytes with normal bone marrow. Other rarely repor and possibly treatment-related adverse reactions were anemia, creased reticulocyte count, rash, purpura, drug fever, hypotensi convulsions, twitching, salivation, nausea, vomiting, increased tra aminase activity (SGOT or SGPT), increased serum bilirubin, creased serum calcium, and joint pain.

Packaging: GARAMYCIN Injectable, 40 mg./cc., 2-cc. multiple-d vials, for intramuscular administration.

Equipped for the thyroid emergency?

When an ambulance arrives with the unexpected patient presenting the classical picture of myxedema coma, is your hospital suitably equipped? It is if SYNTHROID® (sodium levothyroxine) injectable is at hand. You are also ready to conveniently handle post-operative thyroid medication situations until oral therapy can be reinstated.

In tablet form this single entity synthetic thyroid provides smooth, predictable response for thyroid replacement. An excellent drug for long-term therapy.

But in an emergency, when rapid replacement is needed to sustain life, prompt clinical response is essential. SYNTHROID injection makes this therapy instantly available. Is it available in your hospital?

Levothyroxine has a high binding capacity for serum proteins in contrast to other thyroid medicaments that may contain a thyroactive agent with low binding capacity. *The bound levothyroxine is totally measurable using the serum PBI test. It is not unusual to find PBI levels of 8-10 mcg. per 100 ml. of serum.*

INDICATIONS: SYNTHROID (sodium levothyroxine) INJECTION is specific replacement therapy for diminished or absent thyroid function resulting from primary or secondary atrophy of the gland, congenital defect, surgery, excessive radiation, or antithyroid drugs. It is indicated in myxedematous coma and other thyroid dysfunctions where rapid replacement of the hormone is required. When a patient does not respond to oral therapy, SNYTHROID (sodium levothyroxine) INJECTION may be administered intravenously.

PRECAUTIONS: As with other thyroid preparations, overdose may cause diarrhea or cramps, nervousness, tremors, tachycardia, insomnia and continued weight loss. These effects may become apparent in from 4 days to three weeks. Therefore, patients should be kept under close observation. Medication, in such cases, should be stopped for 2 to 6 days, then resumed at a lower level. In patients with diabetes mellitus, look for possible changes in metabolic activity which may affect insulin or other antidiabetic drug dosage requirements.

CONTRAINDICATIONS: Thyrotoxicosis, acute myocardial infarction.

SIDE EFFECTS: Side effects are secondary to increased rates of body metabolism: sweating, heart palpitations with or without pain, leg cramps, weight loss, diarrhea, vomiting and nervousness. Myxedematous patients with heart disease have died from abrupt increases in dosage of thyroid drugs. In most cases, a reduction in dosage followed by a more gradual adjustment upward will indicate the patient's dosage requirements without the appearance of side effects.

DOSAGE AND ADMINISTRATION: In myxedematous stupor or coma, with no evidence of severe heart disease, 200 to 400 mcg. of SYNTHROID (sodium levothyroxine) INJECTION may be administered intravenously utilizing a solution containing 100 mcg. per ml. Detectable effects are usually observed by the sixth hour after injection and are fully appreciated during the following day. A repeat injection of 100 to 200 mcg. may be given on the second day if significant improvement has not occurred. The intravenous use of sodium levothyroxine in myxedematous coma is advantageous because it produces a predictable increase in the concentration of protein-bound iodine, eliminates the need for multiple doses until oral therapy is reinstated, circumvents the uncertainty of oral absorption, and avoids the risk of pulmonary aspiration.

SUPPLIED: SYNTHROID (sodium levothyroxine) INJECTION is supplied in 10 ml. vials containing 500 mcg. of lyophilized active ingredient and 10 mg. of Mannitol, N.F.; a 5 ml. vial containing Sodium Chloride Injection, U.S.P. is provided as diluent.

Also supplied as SYNTHROID (sodium levothyroxine) TABLET in color coded compressed tablets, and in seven strengths: 0.025 mg. (orange), 0.05 mg. (white), 0.1 mg. (yellow), 0.15 mg. (violet), 0.2 mg. (pink), 0.3 mg. (green), and 0.5 mg. (blue). Each strength is supplied in bottles of 100 and 500 tablets.

Recommended Faculty Policies

The Mediation Committee, at its April 27, 1970 meeting, voted to adopt the following policies with respect to publicity by physicians, and the solicitation of patients for research projects by hospitals, foundations, etc.

Guidelines for Physicians in Maryland Regarding Public Announcements

Article XIV, Section 1 of the Faculty's Bylaws are as follows: The Principles of Medical Ethics of the American Medical Association are adopted as the ethical standards of the Medical and Chirurgical Faculty of the State of Maryland and shall govern the conduct of members in their relations to each other and the public.

The AMA Principles of Medical Ethics is expanded by the Judicial Council Opinions and Reports. In these opinions we have the following:

13. RELATIONSHIP WITH COMMUNICATIONS MEDIA

A. Each medical society should appoint a communications committee, or designate a responsible individual or individuals, whose duty shall be to provide the communications media with accurate information on all medical matters of interest to the public. This information should be given freely. The communications committee may also serve in an advisory capacity to all communications media and to all physicians of its society in questions involving relationship with the media. To assist the media in obtaining information, medical societies may furnish the media with a list of names of physicians from whom authoritative information may be obtained, or a designated individual may serve as liaison between the media and the profession and furnish names of physicians to provide authoritative information when required.

These spokesmen may be quoted by name and title. This should not be considered by their colleagues as seeking publicity, since it is done in the best interest of the public and the profession. They may ethically provide appropriate information regarding medical and public health matters which have been discussed in technical papers or during medical meetings.

The officers, committee chairmen, and designated spokesmen of medical societies should be available at all times to bona fide representatives of the communications media in order that authentic information may be obtained as soon as possible.

* * *

D. Publications of photographs of physicians, who appear before recognized medical organizations, either in the official program of the scientific meeting or before the public press in connection with such meeting, is permissible. The use of photographs in the press when physicians are elected to office or when physicians are quoted by name on matters of general interest, not related to the care of a specific patient, is likewise permissible. Photographs of physicians in connection with civic or social affairs, not related to medical news or the care of patients, may be published unless the frequency of such photographs bespeaks self-exploitation. This applies also to magazine articles. Physicians should clear such publicity, whenever possible, with their county society.

E. The promise of radical cures or boasting of extraordinary skill or success is considered unethical by the medical profession because it is contrary to the best interest of the public.

F. For the purposes of clarity, the following principles should guide physicians who appear on TV or radio programs or who are interviewed in other media of public information, such as newspapers and magazines:

a) Doctors of medicine are expected to refrain from sponsoring products directly or by implication.

b) When introduced as a doctor on TV or radio programs, or quoted in an article as a physician in newspapers and magazines, such individual cannot escape the implications of representing the medical profession and his conduct should be in keeping with the high standards of the profession.

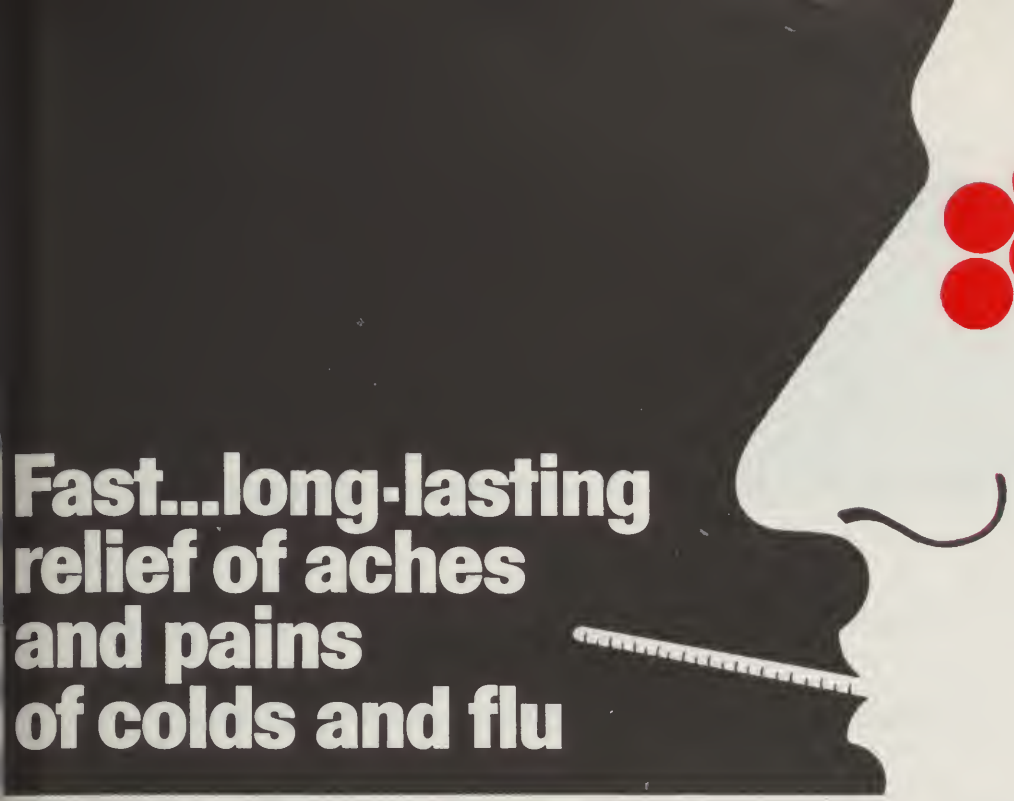
c) Sound judgment, good common sense, and adherence to the Principles of Medical Ethics are expected of any physician when appearing on TV or radio programs, or in other media of public information, such as newspapers and magazines, in whatsoever capacity.

G. Members of medical society speakers bureaus, because of the very nature of their assignments, may

be interviewed or quoted by the communications media. This is not considered unethical conduct.

The members of these committees must be most circumspect and uphold the ideals of the medical profession.

H. At all times the doctor of medicine is expected to comply with the Principles of Medical Ethics. Section 10 of the Principles of Medical Ethics deals with relationships between physicians and the communications media. It says: "The honored ideals of the medical profession imply that the responsibilities of the physician extend not only to the individual, but also to society where these responsibilities deserve his interest and participation in activities which have the purpose of improving both the health and the well-being of the individual and the community." The Judicial Council construes Section 10 as encouraging physicians to work with the communications media as an integral and important part of the principle of upholding the responsibility of the physician to society as a whole.



It shall be the responsibility of each county society to see that these Principles are not violated.

I. Doctors of medicine are ethically and legally required to protect their personal privacy and other legal rights of patients. The doctor-patient relationship and its confidential nature must be maintained. With these considerations in mind, the physician may assist the representatives of these media in every way possible.

Statement on Public Releases in Connection with Mass Screening Surveys and Research Programs

Recognizing the need for appropriate guidelines which individual professionals, voluntary health organizations, hospitals, nursing homes, and others should follow in connection with recruitment of volunteers for mass screening programs, research activities, and other related programs, the Hospital Council of Maryland, Inc., and the Medical and Chirurgical Faculty of the State of Maryland jointly subscribe to the following principles.

1. The right of the patient and the physician to maintain the best possible physician-patient relationship is paramount and no individual should be accepted into such a program without the consent and knowledge of the physician if he is undergoing active treatment.
2. Solicitation of individuals for recruitment into such programs should be done, insofar as possible, through the mechanisms of professional journals, hospital bulletin boards, medical staffs, etc. with full details being disclosed so that physicians can be informed as to the extent, purposes and objectives of such programs.
3. Solicitation may be through the mechanism of individual letters addressed to physicians urging the cooperation of the physician in referring patients for research projects.
4. If medication or treatment is provided to the patient, the attending physician should be kept fully advised so that, in the event he is to see the patient he will be aware of what is taking place with respect to his patient in the research project.
5. Full details of the care provided to his patient should be provided the physician on the completion of the research project. In the event any unknown condition is discovered through the research project, the patient should be advised to see his own physician for any treatment or care that may be necessary in this regard.
6. At all times, cordial relations should be maintained between the persons responsible for the research program and the physicians whose patients are being seen through this mechanism.
7. It is self-evident that patients in a research project should not have any facet of their care by their attending physician criticized or any doubt cast on such treatment.
8. In any event, each person participating in the project should be fully aware of his responsibilities and the responsibilities of his own attending physician and the physician in the research project.
9. No television or radio spot announcements should be directed to the public for recruitment of individuals for such research projects, except for mass screening surveys.
10. The use of normal "ballyhoo" type of promotions is strictly prohibited. This applies to banner-type streamers attached to aircraft, the use of sound trucks, amplifiers, and any type of activity that is normally associated with a circus-type atmosphere.

Fast...long-lasting relief of aches and pains of colds and flu

with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 6,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

The Use of Beta-Adrenergic Receptor Blockade in the Treatment of Cardiac Arrhythmias

BERTRAM PITT, MD
Assistant Professor of Medicine
The Johns Hopkins Hospital

Beta-adrenergic receptor blockade has been found useful in a variety of cardiac arrhythmias. Propranolol, the only beta-adrenergic blocking agent currently approved by the Federal Food and Drug Administration, is almost completely absorbed in the gastrointestinal tract. Its peak plasma concentration occurs approximately 90 minutes after oral administration. Excretion is predominantly in the urine.

Beta-adrenergic receptor blockade depresses the activity of the sinus node (by blocking the effects of endogenous catecholamines) resulting in a slowing of heart rate. Conduction is also depressed through the A-V node and ventricles.

Clinically available propranolol is a mixture of both dextro-(d) and levo-(l) isomers. Electrophysiological studies with pure preparations of these isomers have shown that propranolol, in addition to acting as a beta-adrenergic receptor blocking agent, has a quinidine-like effect on the heart. The effects of quinidine on the electrocardiogram differ from propranolol, however, in that quinidine increases heart rate, P-R interval, duration of the QRS complex, the Q-T interval, and causes inversion of the T wave, whereas propranolol slows the heart rate, has little effect on the P-R interval, shortens the Q-T interval, and increases the height of the T wave. Dextro-propranolol, a relatively weak beta-adrenergic receptor blocking agent, has been shown to be effective in the suppression of ectopic arrhythmias due to digitalis and anesthetic agents through its quinidine-like action, although it is relatively ineffective in controlling ventricular rate in rapid supraventricular arrhythmias. Levo-propranolol, a potent beta blocking agent, results in a slowing of ventricular rate in rapid supraventricular arrhythmias by inhibiting the effects of endogenous catecholamines on A-V conduction.

Propranolol is useful in controlling ventricular rate in patients with paroxysmal atrial tachycardia, while long-term oral therapy may reduce the incidence of recurrent episodes. Propranolol is currently the drug of choice to prevent supraventricular arrhythmias in patients with the Wolff-Parkinson-White syndrome by causing both antegrade and retrograde block at the A-V junction preventing a re-entry mechanism. Although digitalis is still the preferred drug for the control of ventricular rate in patients with rapid atrial fibrillation and flutter, propranolol is proving to be a valuable adjunct. Propranolol may be given intravenously in increments of 0.5 to 1 mgm to those patients in whom an intravenous digitalis preparation fails to adequately slow ventricular rate in the desired period of time. This increment of propranolol may be repeated every two to five minutes with careful monitoring of blood pressure and electrocardiogram, until the ventricular rate falls to an adequate level. The total dose required to achieve an adequate slowing of ventricular rate varies, depending upon the amount of digitalis administered,

patient sensitivity, and circulating catecholamine level. Most patients will, however, respond to a total dose of 5 mgm or less. It may prove safer to use small increments of intravenous propranolol to slow ventricular rate in these arrhythmias rather than risk the possibility of digitalis intoxication with large doses of digitalis, especially in situations such as the postoperative period. Similarly, oral propranolol in doses of 10 to 40 mgm qid in combination with digitalis has been found useful in the long-term management of ventricular rate in patients with atrial fibrillation. Propranolol has not, however, been found useful in restoring sinus rhythm in these patients. Beta-adrenergic receptor blockade with propranolol should not be used in those patients in whom these arrhythmias occur during the course of congestive heart failure, since the failing myocardium is particularly dependent upon beta-adrenergic stimulation for maintenance of adequate contractility. In those patients in whom the rapid ventricular rate precipitates or contributes to the manifestations of congestive failure, propranolol may, however, occasionally be used with extreme caution.

Beta-adrenergic receptor blockade has also been used in patients with atrial or ventricular arrhythmias due to digitalis intoxication where other measures; such as withholding digitalis and potassium administration, have failed. In animals with experimentally induced digitalis intoxication, propranolol has, however, occasionally produced profound bradycardia, enabling ventricular tachycardia to occur by an escape mechanism. Propranolol has been an effective agent in arrhythmias occurring during anesthesia, since these arrhythmias are often associated with elevated levels of circulating catecholamines. Propranolol should, however, be avoided during ether anesthesia since maintenance of adequate ventricular contractility is dependent upon circulating catecholamines in this situation. Propranolol is also effective in the control of tachycardia and arrhythmias in patients with phaeochromocytoma undergoing surgery. The combination of an alpha-adrenergic blocking agent such as phentolamine with propranolol has been used in the long-term management of patients with inoperable phaeochromocytoma.

Propranolol has been increasingly used in controlling ventricular rate in various hyperkinetic circulatory states including anxiety, hyperkinetic heart syndrome, and thyrotoxicosis. It has also been used successfully with refractory ventricular arrhythmias occurring during a variety of conditions including myocardial infarction. The risk of precipitating congestive heart failure in this situation outweighs the benefits in most instances. The introduction of newer, more selective beta-adrenergic receptor blocking agents without myocardial depressant effects may, however, prove useful in the therapy of myocardial infarction in the future.

In patients with impaired ventricular function, propranolol may intensify the manifestations of congestive heart failure as mentioned above and has led to profound hypotension and death since these patients may be dependent upon beta-adrenergic stimulation for maintenance of adequate cardiac contractility. Propranolol may also lead to profound bradycardia and, on occasion, complete heart block through its effects on A-V conduction. The drug should, therefore, be used with extreme caution in the presence of bradycardia and should be avoided in the presence of second degree or complete heart block. It should also be avoided in patients with bronchial asthma since beta-adrenergic receptor blockade interferes with the effects of endogenous circulating catecholamines on the bronchial smooth muscle. Some of the newer beta-adrenergic receptor blocking agents, not as yet released for clinical use in this country, have a greater specificity than propranolol and show promise of avoiding the bronchoconstrictor effects of propranolol while maintaining their effects on A-V conduction. Propranolol has also led to hypoglycemia and it should be avoided in patients receiving monoamine oxidase inhibitors or other adrenergic augmenting psychotropic drugs. The other side effects of propranolol are infrequent and rarely necessitate stopping therapy.

When it comes to medical offices, variety is the name of the game with us. However, it is a special variety which is highly selective of design and most importantly, insists on adequate proportions, comfort and durability. Visit our showrooms or call one of our decorators and put our variety and experience to work for you. **American Office Equipment Co., Inc.**

call me "Achro® V"

Every pharmacist knows ACHRO® V stands for ACHROMYCIN® V

Contraindications: Hypersensitivity to tetracycline.
Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.
Precautions: Nonsusceptible organisms may overgrow; treat superinfection appropriately. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).
Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage. Upon adverse reaction, stop medication and treat appropriately.

Achromycin® V
Tetracycline

484-9

I love my family.
I adore this house.
My in-laws are great.
The neighbors are wonderful.

Indications: For use in management of anxiety and tension occurring alone or as accompanying symptom complex to medical and surgical disorders and procedures. Though not a hypnotic, fosters normal sleep through antianxiety and related muscle-relaxant properties.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep, reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated). Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack]. Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

The young homemaker: her underlying anxiety and tension can surface and intensify under the continuous stress of rearing a growing family. Especially when she's confined to the home and its environs so much.

You can help her over the rough spots with reassurance and counsel. Equanil can help relieve tension, ease anxiety—with little risk of serious side effects. Time and experience will probably do the rest.

MEDICAL NEWS

The federal Truth in Lending Act, which went into operation on July 1, 1969, has been clarified by a letter from Paul R. Dixon, chairman of the Federal Trade Commission, to Sen. Charles E. Goodell (R-N.Y.):

"The Truth in Lending Act does not come into play in a situation in which the patient decides on his own to pay his bill in installments. However, when a physician comes to a specific agreement with a patient to pay the physician's fee in more than four installments, then (the regulation) requires written disclosure of all *applicable* points of information at the time of the agreement. This will . . . be a very simple matter. . . .

"The following brief disclosure would satisfy the Truth in Lending Act:

Cash Price (Medical Fee)	**$500**
Less: Cash Down Payment (Advance Payment)	**100**
Unpaid Balance	**400**
Amount Financed	**400**
FINANCE CHARGE	**NONE**
Total of Payments	**400**
Deferred Payment Price	**500**
ANNUAL PERCENTAGE RATE	**NONE**

Purchaser (Patient) hereby agrees to pay to Dr. John Doe at the address shown above the "TOTAL OF PAYMENTS" shown above in 10 monthly installments of $40, the first installment being payable ..... 19...., and all subsequent installments on the same day of each consecutive month until paid in full."

The two items, FINANCE CHARGE and ANNUAL PERCENTAGE RATE, must appear in bold-face type or otherwise conspicuously, AMA attorneys emphasize.

According to Dixon's directive, the "use of the above form could be effectuated by any physician's nurse in a few moments and no other disclosure is required on subsequent billings."

(Excerpted from *American Medical News,* October 13, 1969.)

The Social Security Administration has recommended that the Justice Department bring civil suit against four extended-care facilities and a two-hospital corporation for the return of wrongfully collected Medicare payments, Robert M. Ball, Commissioner of Social Security, announced recently.

The five civil suit cases were referred to the Justice Department after evidence was found that the institutions, located in New York, Florida, Arizona, and Illinois, had collected overpayments amounting to approximately $2,257,600.

In a series of "validation" visits begun in March 1969, on-site inspections of institutions participating in the Medicare program were conducted to check on the validity of payments made by Medicare intermediaries. These program validization visits were supplemental to the regular contract performance reviews the SSA conducts in the offices of the intermediaries such as Blue Cross, Blue Shield, and private insurance organizations which receive and pay Medicare bills under contract to the SSA.

Commissioner Ball noted that one out of every 12 elderly persons discharged from a hospital, but still needing skilled nursing care on a continuous basis, is admitted to an extended-care facility under Medicare. There are about 40,000 such admissions every month, after an injury or illness requiring hospitalization for three days or more.

The average Medicare post-hospital stay in such a facility averaged 50 days in 1969 and payments totalled between $400 million and $450 million for the past calendar year.

To assist the Medicare contractors, the SSA has provided data that helps them to quickly identify irregular practices and costs. The identification of an institution which bills for what is indicated to be an unusual amount of physical therapy may reveal that services are being provided, and paid for, without regard to their medical necessity, and even their potential harm to elderly patients. An abnormally large number of bills for physician visits to patients in extended-care facilities may uncover a practice of "gang" visits to individual patients, but in fact reports so many visits for a given day that he could not have done more than stop by the bed.

The SSA has also developed information that will enable the Medicare contractors to be alerted when a physician is receiving payments for more services than he would likely be able to perform in normal practice. If computer data and investigation show this to be a problem, these organizations enlist the help of medical societies to take corrective action.

In his presidential address to the AMA House of Delegates in December, Gerald D. Dorman, MD, stated "the AMA can serve the best interests of physicians only when we serve those of the patient first. We are banded together to make ourselves more effective physicians so that we can serve our patients better."

He emphasized that "In the decade ahead (a decade he titled 'The Significant Seventies') the AMA must become—and prove to the public through visible action that it has become—more patient oriented."

In so doing, he said, medicine must take on the challenges of problems such as the alcoholic, the drug user, the fat man, the smoker, and the drunken driver.

Dr. Dorman added that meeting all of the problems calls for a "separate, cabinet-ranked department of health, drawing together all health activities of the government under one roof."

Regarding the AMA itself, the president said the Association has concentrated on being an organization for the physician in private practice. Now, he added, it must strive to attract physicians who are educators, researchers, administrators, and in federal service.

Another segment of the medical profession that must be attracted is the future physician. The AMA must find ways "to attract medical students, interns, residents, and other young physicians." Anticipating objections, he said, "We need to face up realistically to the fact that although we don't like the criticism of some of the younger members and would-be members of our profession—and perhaps we don't approve of the leftward lean of some of their politics—these young professionals are nonetheless as much, or more, patient oriented than some of us."

To accomplish the AMA's goals, Dr. Dorman warned, "We may have to alter certain of our cherished traditions. We must be prepared to accept and support totally new ideas, whether we devise them or they are devised by somebody else, providing they work well after adequate trial."

* * *

A Memphis health executive stated recently that current ills affecting the Medicare program may be a result of some fraud and deceit on the part of physicians and providers, but that the real culprit in the escalating cost of Medicare is the Social Security Administration which has failed to provide direction and interpretation.

John A. DeCell, president of Medicenters of America, Inc., an organization which encompasses extended-care facilities across the nation, said that there has been a concerted effort by SSA to control utilization of benefits in less expensive areas of extended care, but no effective effort to cut down on the time a Medicare patient occupies the higher cost, acute-care hospital bed.

"Most health authorities agree that 40% to 60% of hospitalized patients do not need the care of a general hospital and could receive care in a less costly, specialized recuperative care facility . . . but there has been no incentive given by SSA to effect the transfer," DeCell said. "With the current hodgepodge of regulations and interpretations, the physician finds it much simpler to leave the patient in the hospital where he knows that Medicare will pay the bill . . . until SSA comes up with meaningful guidelines both for hospital and extended-care coverage, there is going to continue to be waste and lack of control. . . . It is our feeling that a total re-evaluation of the aims and objectives of the Medicare Law should be made and guidelines established before sweeping changes are made that can cause more chaos in our health delivery system."

A list of obstetric-gynecologic related graduate fellowships has been developed in the ACOG Administrative Office. The list contains subject, location, length, stipend, degree of clinical teaching, and research responsibility, and other information in tabular form. It is intended for the use of Fellows or Junior Fellows, Directors of Residency Programs, and others interested in existing and available fellowships. More than 90 fellowships covering the major fields of specialized study are included.

Copies may be obtained by writing: Fellowships, Communications Department, ACOG, 79 West Monroe Street, Chicago, Illinois 60603.

* * *

A group of physicians in the Baltimore metropolitan area, in the practice of Hospital Liaison Psychiatry, have organized the **Baltimore Association of Liaison Psychiatrists.** Elected as officers of the Association are: **Bernard R. Shochet, MD, President; Leonard Hertzberg, MD, Secretary-Treasurer; and Samuel Blumenfeld, MD, Program Chairman.**

* * *

Carl F. Weber, president of Lutheran Hospital's Board of Governors, has announced the election of James H. Shell, Jr., MD, as President of the medical staff at the hospital.

Dr. Shell was an assistant resident in surgery at the old West Baltimore General Hospital in 1948. He served as a resident at the University of Maryland Hospital from 1948 to 1951. He is now chief of gynecology at Lutheran Hospital.

* * *

Four Baltimore physicians were recently honored by the American College of Physicians at its annual meeting in Philadelphia.

W. Barry Wood, Jr., MD, and Ephraim T. Lisansky, MD, received the honorary degree of master. **Theodore E. Woodward, MD,** was presented the James Bruce Memorial Award for his work in preventive medicine. **John Imboden, MD,** was elected to an honorary fellowship.

Dr. Woodward is Professor of Medicine and head of the Department of Medicine at the University of Maryland School of Medicine, while Dr. Lisansky is Associate Professor of Medicine and Psychiatry there. Dr. Wood is Professor of Microbiology and head of the department at The Johns Hopkins School of Medicine, and Dr. Imboden is Associate Professor of Psychiatry at Hopkins.

* * *

William P. Houpt, MD, of Bel Air, was recently installed as a Fellow of the Industrial Medical Association in ceremonies marking the organization's 55th annual meeting.

The Association is an international organization of physicians who provide health care for the employees of private enterprises, governmental services, or other institutions. Association membership in the U.S. and 31 foreign countries exceeds 3,800.

* * *

The American Board of Anesthesiology has recognized the following physicians as Diplomates: **Robert R. Hylton, MD,** of Camp Springs; **Edward P. Juras, MD,** of Rockville; and **Peter B. Kane, MD, Allan L. Smith, MD,** and **Robert K. Stoetling, MD,** of Bethesda.

* * *

Gilbert D. Barkin, MD, of Silver Spring, has been appointed to the Board of Directors and to the Board of Governors of the American Association of Certified Allergists.

* * *

Solomon H. Snyder, MD, has received the John Jacob Abel Award of the American Society for Pharmacology and Experimental Therapeutics. The award, the Abel medal and $1,000, recognizes outstanding work in the field of drugs by an individual under the age of 36.

Dr. Snyder, 31, Professor of Pharmacology and Experimental Therapeutics, and Professor of Psychiatry at The Johns Hopkins University School of Medicine, received the award at the society's annual meeting in Atlantic City. He is the first member of the Hopkins faculty to receive the 20-year-old award.

Dr. Snyder was cited for "significant contributions that will lead to more certain recognition and predictability of the action of hallucinogenic drugs and more efficacious management of Parkinsonism and mental illness."

(Continued on page 72)

THE MONTH IN WASHINGTON

The American Medical Association urged that Congress appropriate as much money as possible for medical education to help "meet the pressing need which exists today for an increased number of physicians."

Testifying before a House appropriations subcommittee, C. H. William Ruhe, MD, director of the AMA's Division of Medical Education, said the association recognized the need for an overall reduction in federal spending to combat inflation.

"In view of this," he said, "we believe that in any appropriation priorities established for all government programs, those which affect health care should be given primary consideration. Further, because of the special need that exists at this period in our history for more physicians, we urge that appropriations relevant to the production of physicians be given first priority."

Dr. Ruhe pointed out that funds had not been appropriated for a backlog of approved applications for construction of facilities for new medical schools and expansion of existing schools as authorized by the Health Professions Education Assistance Act, the Health Research Facilities Construction Act and the Medical Library Act. He also said that full funding, in the amounts authorized by the Health Manpower Act of 1968, is necessary to permit construction of new and expanded facilities before major enrollment increases in medical schools will be feasible.

"The provision in the Administration budget of funds for the Physician Augmentation Program and for special improvement grants has been a considerable incentive to medical schools to expand enrollments," Dr. Ruhe said. "But many schools have already increased their enrollments to full capacity in their existing facilities. Others have been in serious financial distress and are in desperate need of increased operational support to maintain their present enrollments or even to survive. It must be recognized that such schools will need further facilities and operating funds which are necessarily tied to increased enrollments."

The subcommittee's hearings were on appropriations for the 1971 fiscal year beginning this July 1.

Using funds appropriated for the current fiscal year, 1970, the Department of Health, Education and Welfare recently announced nearly 300 grants to schools of medicine and other health professions totalling more than $54 million.

About $7.6 million went to 27 schools of medicine and osteopathy under the Physician Augmentation Program. A government spokesman said the grants would enable the schools to increase their first-year enrollment by 395 students.

About $46.5 million in institutional grants was allotted to 260 schools in the health professions—medicine, dentistry, osteopathy, podiatry, optometry, pharmacy, and veterinary medicine. These funds also will enable the schools to add more students through purchase of new teaching equipment, improvement of the physical teaching environment, purchase of supplies, books and periodicals, and other expenditures to improve the education of students.

* * *

The American Medical Association supports extensions of the Regional Medical Programs and, with some reservations, the program for Comprehensive Health Planning and Public Health Services.

Testifying before a House Public Health and Welfare Subcommittee, Bland W. Cannon, MD, Memphis, Tenn., a member of the AMA's Council on Medical Education, emphasized that the AMA believes that RMP "should continue as a program of continuing medical education, with patient care being limited to demonstrations as an adjunct of the education and research processes."

He said the AMA opposes legislation that would combine the individual programs.

"These programs are relatively new and we believe should be evaluated, as well as allowed to develop further evidence of their individual strengths and weaknesses," he said.

Dr. Cannon pointed out that the AMA House of Delegates last December affirmed its support of the concept of Regional Medical Programs and urged AMA members to participate at all levels in giving guidance to implementing the programs.

The AMA supports broadening the scope of the programs to include "other major diseases", in addition to heart disease, cancer and stroke, he said.

He said a combination of the programs would result in a change toward emphasis on patient care in RMP.

"We would view with grave concern any attempt to change this essentially educational program to a program for the provision of health services," Dr. Cannon said. "The medical profession today generally views RMP as a means of aiding the physician to provide better care to his patients. It is this attitude which has brought about the outstanding cooperation between practicing physicians and RMP, and which has been a major cause of success for the program thus far. If RMP returns to an earlier concept of providing services to the patient, rather than its present goal of assisting the individual physician to treat the patient more effectively, this cooperation will, in many cases, be lost. The program's beneficial accomplishments will then be diminished."

* * *

The American Medical Association supports, in general, legislation (S. 3835) that would provide a comprehensive federal program for the prevention and treatment of alcohol abuse and alcoholism.

Marvin A. Block, MD, Buffalo, N.Y., a member of the AMA's Committee on Alcoholism and Drug Dependence, termed the measure "a major landmark in public policy" in the field.

"It sets forth the proposition that alcoholism is an illness which can and should be treated, and it commits national resources to the establishment and coordination of facilities necessary for treatment and rehabilitation," he said at a hearing of the Senate Subcommittee on Alcoholism and Narcotics. "We are in general agreement with this legislation."

The bill would establish a National Institute for the Prevention and Control of Alcohol Abuse and Alcoholism. The Health, Education and Welfare Secretary, acting through the institute, would be required to submit within one year a detailed federal program, develop model programs for states, and conduct research and educational programs. Federal grants would be authorized for prevention, treatment and rehabilitation facilities and programs at the state and local level.

Dr. Block specifically favored several of the bill's provisions, including one that treatment and control programs should be community based, whenever possible.

"Insofar as it is feasible and economically sound, most alcoholics should be treated in their own communities and not be relegated to a distant centralized institution for treatment," he said.

But the AMA spokesman questioned some other provisions. He saw no need for a new institute. He said the present National Center for Prevention and Control of Alcoholism could perform the proposed institute's duties and responsibilities.

He said the AMA also questions whether alcoholics should be made eligible for welfare cash benefits and for health care under other government programs, such as medicare and medicaid, on the ground that they are alcoholics.

Noting that the legislation is concerned mainly with operation of programs by public and voluntary agencies, Dr. Block said:

"We should not overlook, however, the role that the private physician has played, and can play, in this important area. More and more, the physicians of this country are facing up to the problem of alcoholism in their daily practice. They are recognizing that, as difficult as alcoholism may be, it is an illness which can be dealt with, and that they can help their patients in cooperation with other professionals in the community."

The bill was introduced by Sen. Harold E. Hughes (D., Iowa), a recovered alcoholic and chairman of the subcommittee, and 37 co-sponsoring senators.

* * *

L-dopa, a new treatment for Parkinson's disease, has been approved for general prescription use, but it may be several months before it is available in ample supply.

"Clinical tests conducted during the past several years by medical researchers and two major drug firms have demonstrated the usefulness of L-dopa in the treatment of this disease which now afflicts possibly a million persons," FDA Commissioner Charles C. Edwards, MD, said.

Approvals were granted to applications made by Hoffman-La Roche, Inc., and Eaton Laboratories Division of the Norwich Pharmacal Co., Norwich, New York. (Eaton's product, Dopar [levodopa], is now available.) Both firms conducted studies in animals and humans to establish the drug's safety and effectiveness. An analysis of these studies indicated that benefits to the patient outweigh the risks involved, the FDA said.

"However, the Food and Drug Administration will require both drug firms to continue research into the drug's long-term effects and make certain it is safe and effective for long-term use," Dr. Edwards said. "This is the first time that FDA has included such a requirement in a new drug approval."

In order to give a balanced picture, Edwards pointed out that: • Clinical studies have shown that approximately one third of the patients receiving L-dopa do not respond favorably; • Side effects have been reported in a majority of patients, some of them quite unpleasant and others even dangerous. Whether or not the use of this drug is justified in the very early stages of Parkinson's has not

been established; • Since Parkinsonism is a chronic disease, patients will have to take L-dopa for long periods of time. We don't know how these patients will react after 5, 10, or 15 years of treatment. Because of our limited knowledge of the drug's long-term toxicity, it is conceivable that it could reverse the benefit-to-risk ratio.

The name L-dopa comes from the initials of an amino acid, levodihydroxyphenylalanine. Dr. George C. Cotzias, of the Medical Research Center, Brookhaven National Laboratory in Upton, New York, was the first to demonstrate the usefulness of L-dopa at high dosage levels. Dr. Andre Barbeau, director of the Department of Neurobiology at the Montreal Clinical Research Institute, has been studying the new drug for the past ten years and is also credited with aiding in its development as a treatment for Parkinsonism.

* * *

Congress approved legislation extending the 24-year-old Hill-Burton federal-aid-to-hospitals program for three years with authorized expenditures of $2.76 billion.

The final form of the legislation was a compromise agreed to by House and Senate conferees after the two branches of Congress passed differing versions.

The authorized expenditures broken down are: $1.26 billion for various state grant-in-aid programs for construction and modernization of hospitals, and $1.5 billion for loan guarantees. The measure also authorizes funds to subsidize interest payments on loans up to 3%.

The legislation approved by the conferees followed the House version for the most part. The Senate had approved a five-year $6.2 billion bill. The conferees eliminated entirely a Senate provision for $750 million of direct loans for public hospitals, which was strongly opposed by the Nixon Administration.

Also knocked out was a Senate amendment for a new formula for allocation of federal funds in a way that would have benefited large industrial states. However, the Health, Education and Welfare Department was directed to make a study of possible formula changes and report to Congress in two years.

* * *

Two physicians and a management expert were appointed Deputy Assistant Secretaries for Health, three long-vacant posts in the Department of Health, Education and Welfare.

Thomas C. Points, MD, Oklahoma City, is deputy assistant secretary for Health Services. He is an alternate in the AMA House of Delegates and on the AMA Council on Health Manpower. As director of the Department of Preventive Medicine at the University of Oklahoma Medical Center, he helped establish the state's rural health project, "Project Responsibility".

LeRoy A. Pesch, MD, Buffalo, N.Y., deputy assistant secretary for Health Manpower, was dean of the School of Medicine at the State University of New York at Buffalo.

Gerald Riso, New York city, formerly with Booz, Allen and Hamilton, Inc., management consultants, is deputy assistant secretary for Policy Implementation.

Still vacant, in early June, were the posts of Deputy Assistant Secretary for Research and Development and for Environmental Health and Prevention of Disease Problems.

Morris E. Chafetz, MD, director of Clinical Psychiatric Services of Massachusetts General Hospital, Boston, was selected to succeed Jack Mendelson, MD, as chief of the National Center for the Prevention and Control of Alcoholism. Dr. Mendelson is returning to a teaching post at Harvard Medical School.

Two high-ranking officials left the HEW Department with critical blasts directed at their bosses.

Stanley F. Yolles, MD, said he quit as director of the National Institutes of Mental Health because the Nixon Administration had abandoned the mentally ill. HEW Secretary Robert H. Finch said he was fired because he was not cooperative. Dr. Yolles was succeeded by Dr. Bertram Brown who had been deputy director. Despite the dispute, Dr. Yolles will stay in HEW until November 1 as an assistant for mental health to Dr. Vernon Wilson, new director of HEW's Health Services and Mental Health Division. Dr. Wilson succeeded Dr. Joseph T. English who resigned quietly to take a high public health post in New York city.

Robert J. Myers, chief actuary of the Social Security Administration for 23 years, resigned with a charge that Social Security Administrator Robert M. Ball had attempted "to muzzle and intimidate me with regard to three speeches that I was making in support of the Nixon Administration's position on social security legislation." Ball denied it, and countered that Myers, who was supposed to be an objective career civil servant, had wanted to be a policy spokesman.

Myers had publicly accused Ball and other high SSA officials of being "expansionists" in the social security field with a goal of the federal government providing a retirement income level virtually as high as before retirement.

In a letter of resignation, Myers told Finch that these officials "have not—and will not—faithfully and vigorously serve the Nixon Administration."

Campbell's Soups... wide variety...for limited appetites

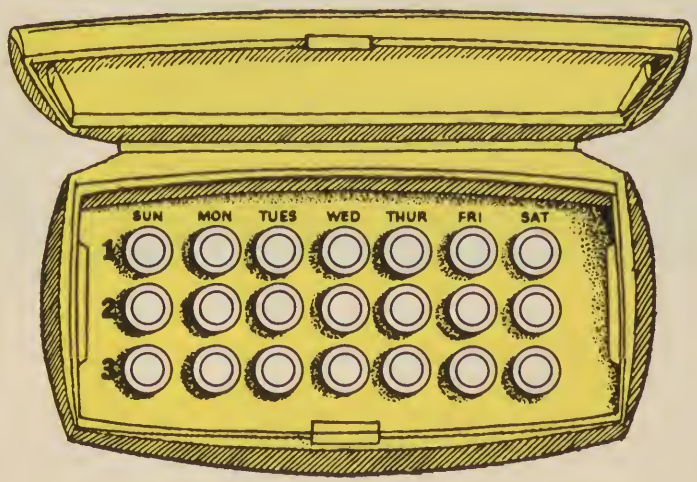
Many people lose interest in food as they grow older. Some of them are fussy eaters—with only a few favorite foods. Others become indifferent to foods—because planning and preparing meals becomes a chore. Here Campbell's Soups can help —for these four very good reasons:

Appeal With a variety of tastes, textures, aromas, and colors, Campbell's Soups can add interest and appetite appeal. And they're easy to eat—ingredients are tender, bite-size. Even patients on special diets will find soups they can enjoy among the more than 50 different varieties available.

Nourishment Campbell's Soups contain selected meats and sea foods, best garden vegetables—carefully processed to help retain their natural flavors and nutritive values.

Convenience Within 4 minutes a bowl of delicious soup is heated and ready to eat.

Economy Campbell's Soups are inexpensive—an important consideration to those whose budgets are limited.



Recommend Campbell's Soups . . . and, of course, enjoy them yourself. Remember, *there's a soup for almost every patient and diet . . . and for every meal.*

Announcing the half-new pil

Dem

What's new: 50 mcg. ethinyl estradiol

... Demulen offers added assurance in view of today's concern

What isn't: 1 mg. ethynodiol diacetate

... Demulen offers the distinctive Searle progestin proved in millions of women

Demulen—the one oral contraceptive that provides this new combination—offers • A full measure of confidence: Unsurpassed contraceptive effectiveness, and the low estrogen content—50 mcg.—is especially significant today • A full measure of comfort: A low incidence of breakthrough bleeding and other side effects.

Demulen continues the Searle tradition of unmatched convenience. • Sunday starting, cycle after cycle: Three weeks on, one week off. There is no simpler pill-taking schedule. • A package that helps keep her on schedule: The Demulen Compack® tablet dispenser is patient-proof. Day and week of cycle are clearly designated for each tablet.

ulen®

Each tablet contains 1 mg. ethynodiol diacetate/50 mcg. ethinyl estradiol

Actions—Demulen acts to prevent ovulation by inhibiting the output of gonadotropins from the pituitary gland. Demulen depresses the output of both the follicle-stimulating hormone (FSH) and the luteinizing hormone (LH).

Special note: Oral contraceptives have been marketed in the United States since 1960. Reported pregnancy rates vary from product to product. The effectiveness of the sequential products appears to be somewhat lower than that of the combination products. Both types provide almost completely effective contraception.

An increased risk of thromboembolic disease associated with the use of hormonal contraceptives has now been shown in studies conducted in both Great Britain and the United States. Other risks, such as those of elevated blood pressure, liver disease and reduced tolerance to carbohydrates, have not been quantitated with precision.

Long-term administration of both natural and synthetic estrogens in subprimate animal species in multiples of the human dose increases the frequency of some animal carcinomas. These data cannot be transposed directly to man. The possible carcinogenicity due to the estrogens can be neither affirmed nor refuted at this time. Close clinical surveillance of all women taking oral contraceptives must be continued.

Indication—Demulen is indicated for oral contraception.

Contraindications—Patients with thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia and undiagnosed abnormal genital bleeding.

Warnings—The physician should be alert to the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism and retinal thrombosis). Should any of these occur or be suspected the drug should be discontinued immediately.

Retrospective studies of morbidity and mortality in Great Britain and studies of morbidity in the United States have shown a statistically significant association between thrombophlebitis, pulmonary embolism, and cerebral thrombosis and embolism and the use of oral contraceptives. There have been three principal studies in Britain[1-3] leading to this conclusion, and one[4] in this country. The estimate of the relative risk of thromboembolism in the study by Vessey and Doll[3] was about sevenfold, while Sartwell and associates[4] in the United States found a relative risk of 4.4, meaning that the users are several times as likely to undergo thromboembolic disease without evident cause as nonusers. The American study also indicated that the risk did not persist after discontinuation of administration, and that it was not enhanced by long-continued administration. The American study was not designed to evaluate a difference between products. However, the study suggested that there might be an increased risk of thromboembolic disease in users of sequential products. This risk cannot be quantitated, and further studies to confirm this finding are desirable.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions medication should be withdrawn.

Since the safety of Demulen in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the time of the first missed period.

A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant cannot be determined at this time.

Precautions—The pretreatment and periodic physical examinations should include special reference to the breasts and pelvic organs, including a Papanicolaou smear, since estrogens have been known to produce tumors, some of them malignant, in five species of subprimate animals. Endocrine and possibly liver function tests may be affected by treatment with Demulen. Therefore, if such tests are abnormal in a patient taking Demulen, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of progestogen-estrogen preparations preexisting uterine fibromyomas may increase in size. Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. In breakthrough bleeding, and in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In undiagnosed bleeding per vaginam adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged Demulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Demulen therapy. The age of the patient constitutes no absolute limiting factor, although treatment with Demulen may mask the onset of the climacteric. The pathologist should be advised of Demulen therapy when relevant specimens are submitted. Susceptible women may experience an increase in blood pressure following administration of contraceptive steroids.

Adverse reactions observed in patients receiving oral contraceptives—A statistically significant association has been demonstrated between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism and cerebral thrombosis.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals and mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption and itching.

The following laboratory results may be altered by the use of oral contraceptives: hepatic function: increased sulfobromophthalein retention and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test and pregnanediol determination.

Dem/ulen®

Each tablet contains 1 mg. ethynodiol diacetate/50 mcg. ethinyl estradiol

IN G.U. THERAPY
Does not create problems...

SOLVES THEM
WITH FIRST DOSE PAIN RELIEF

Urised is a problem solver; it brings patient comfort with first dose pain relief. Unlike newer antibiotics or sulfonamides, Urised does not create problems. It has a time tested record of minimal side effects. For over 50 years, Urised has created physician and patient confidence by providing effective therapy when needed.

FIRST DOSE PAIN RELIEF

URISED®

For G.U. Frequency – Urgency – Burning

Clinically effective for G.U. Therapy [1-5]

- **CYSTITIS**
- **PYELITIS**
- **TRIGONITIS**
- **URETHRITIS**

Each blue-coated tablet contains these active ingredients:

Atropine Sulfate	0.03 mg.	Methylene Blue	5.4 mg.
Hyoscyamine	0.03 mg.	Phenyl Salicylate	18.1 mg.
Methenamine	40.3 mg.	Benzoic Acid	4.5 mg.

Contraindications: Glaucoma, urinary bladder neck or pyloric obstruction, duodenal obstruction and cardiospasm. Hypersensitivity to any of the ingredients.

Warnings: Do not exceed recommended dosages.

Precautions: Administer with caution to persons with known idiosyncrasy to atropine and cardiac disease. While under this therapy the urine is blue; patients should be so advised to allay apprehension.

Adverse Reactions: Neither irritation nor untoward reactions have been reported; however, if pronounced dryness of the mouth, flushing, or difficulty in initiating micturition occurs, decrease dosage. If rapid pulse, dizziness or blurring of vision occurs, discontinue use immediately. Acute urinary retention may be precipitated in prostatic hypertrophy.

Dosage and Administration: Adults: Two tablets, orally, four times per day, followed by liberal fluid intake. Older children reduce dosage in proportion to age and weight.

How Supplied: Bottles of 100, 500 and 1,000 tablets.

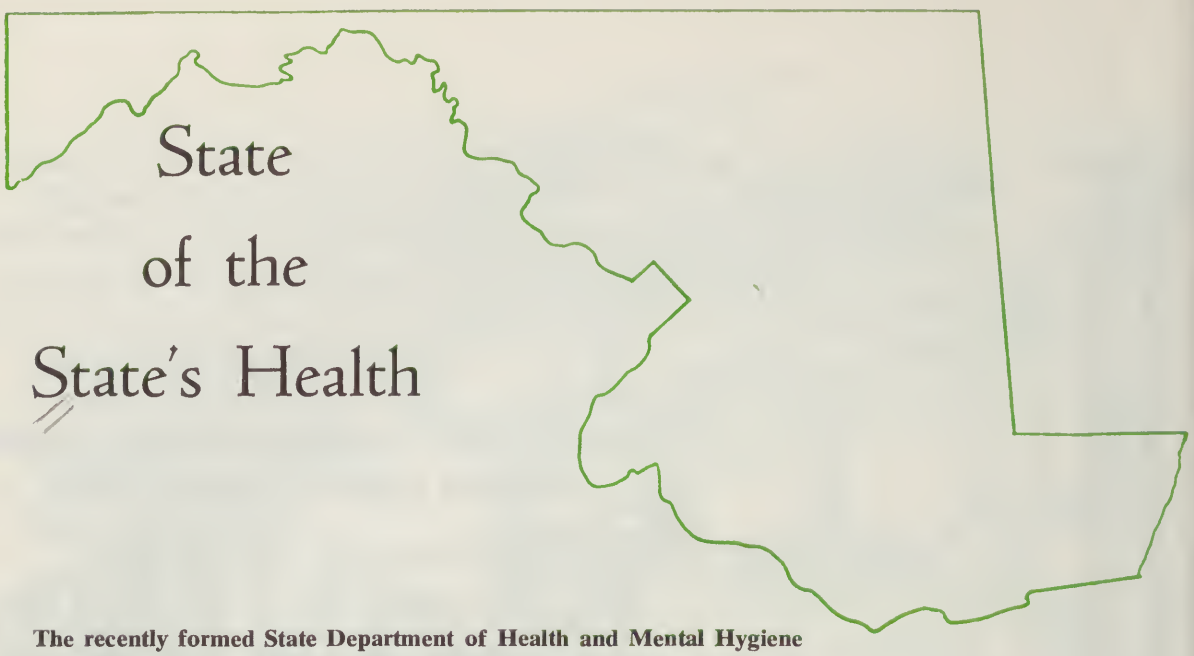
"Mommy,
I don't feel
so good..."

Young heads and stomachs often can't manage the pace of hurry-up-and-stop for the light... or going up hill, down hill, and around the curve. All too quickly a pleasant drive can become an upsetting trip. *Motion sickness makes children—and their parents—absolutely miserable.*

You can help make young patients better passengers with

BONINE®

(MECLIZINE HCl)



Bonine protects most patients—young or old—against nausea and vomiting up to 24 hours with a single dose. Pleasant-tasting Bonine tablets are chewable. They can be taken anytime, anywhere, without water. In difficult cases, multiple daily doses may be necessary for maximum response.

Precautions: Although the incidence of drowsiness and atropine-like side effects such as dry mouth and blurring of vision is low, the physician should alert the patient to the need for due precautions when engaging in activities where alertness is mandatory. *Use in women of childbearing age:* In weighing potential benefits vs. risk in women of childbearing age, consider the fact that a review of available animal data reveals that meclizine exerts a teratogenic response in the rat. In one study a dose of 50 mg./kg./day (50 times the maximum recommended human dose) produced cleft palate in 2 of 87 fetuses when administered to the rat at critical times during the first 15 days of gestation. At doses of 125 mg./kg./day, meclizine will produce 100% incidence of cleft palate in the rat. At doses of 25 mg./kg./day, decreased calcification of the vertebrae and relative shortening of the limbs were also produced in the rat, but experts disagree as to whether this is a teratogenic response. While available clinical data are inconclusive, scientific experts are of the opinion that this drug may possess a potential for adverse effects on the human fetus. Consequently, consideration should be given to initial use of a nonphenothiazine agent that is not suspected of having a teratogenic potential. In any case, the dosage and duration of treatment should be kept to a minimum.

Supply: 25 mg. scored tablets.

More detailed professional information available on request.

State of the State's Health

The recently formed State Department of Health and Mental Hygiene was established in compliance with legislation passed by the 1969 session of Maryland's General Assembly and signed into law by Governor Mandel. On July 1, 1969, the department was activated.

The new organization encompasses the functions and responsibilities of the former State Board of Health and Mental Hygiene; the existing state departments of Health, Mental Hygiene, Juvenile Services, and Comprehensive Planning; and 127 commissions and major task forces concerned with medical and health activities in Maryland. To these, a Directorate for Mental Retardation Services and a Drug Abuse Authority, activated on January 1, 1970, have been added.

The new department has concentrated its efforts in five major areas: 1. developing a health program to provide protection against environmental pollution, preventable disease, and premature loss of life; 2. providing comprehensive health and medical services for the indigent; 3. providing inpatient and outpatient services for the chronically ill, mentally ill, mentally retarded, narcotic addicts, and persons with tuberculosis; 4. developing community-oriented programs of preventive and rehabilitative services for delinquent children; and 5. promoting better health care through special studies, research, and adequate health manpower.

NEIL SOLOMON, MD, PhD
Secretary of Health and Mental Hygiene

MATTHEW TAYBACK, ScD
Assistant Secretary
Health and Mental Hygiene and Scientific Affairs

Two of the principal determinants of a community's health attainment are its economic status and the level of cohesiveness of its families. Although Maryland ranks tenth in the nation in per capita income, economic advantages are not distributed uniformly. Baltimore city, for example, is a point of concentration of substantial poverty. In Western Maryland's Allegany and Garrett counties, and the Eastern Shore's Caroline, Dorchester, Somerset and Wicomico counties there are pockets of considerable poverty. Where poverty is entrenched, family stability tends to be weakened, and some conventional health problems will persist. Such health problems include a high incidence of tuberculosis, a relatively high rate of infant mortality and premature infants with associated defects, and a high incidence of nutritional anemia.

The previous pattern of public intervention in medical and health problems has been a succession of categorical programs such as tuberculosis control, acute communicable disease control, maternal and child health, control of chronic diseases, institutional care of the mentally ill, control of alcoholism, and narcotic addict control. There is reason to believe that we have reached a point in the multiplicity of such programs and to continue this

pattern would result only in inefficiency and ineffectiveness. At this time, there appears to be an overriding need to emphasize the value of providing a system of care for each family. Health and medical services should be delivered on an individual basis—such as the patient-family physician relationship. Only a steadily declining fraction of the population is able to benefit from such a relationship and the urban poor are not in this bracket.

In connection with its responsibilities for a medical care program for 280,000 indigent Maryland residents, the Department of Health and Mental Hygiene proposes to develop conditions which will afford the recipient easy access to the complex of services required to preserve a modern standard of health.

One of the truly impressive developments during 1969 was a decline in the incidence of tuberculosis from 1,094 cases reported in 1968 to 890 in the past year. This 18% reduction opens the way for a new phase in the strategy of handling this problem—a goal of eradication of this disease.

The examples of smallpox, diphtheria and poliomyelitis offer dramatic evidence of the possibility of eliminating disease. Measles soon will be controlled; undoubtedly, rubella and pertussis will follow the same course. The common factor in each of these examples is the availability of an active immunizing agent for which mass distribution is easily achieved. No such agent exists for tuberculosis, but the virtual elimination of typhoid fever and malaria are examples of diseases controlled without mass distribution of an immunizing agent.

The campaign against tuberculosis will be based largely on widespread use of chemoprophylaxis among tuberculin positive reactors, and disciplined use of chemotherapy among active and recently discharged patients. Because of the decline of the disease 400 beds have been released from the tuberculosis facilities of Baltimore City Hospitals and Mt. Wilson Hospital. It is expected that the 65-bed Pine Bluff Hospital on the Eastern Shore will also be converted to other purposes.

Rubella (German measles) can be a disastrous infection when it occurs among pregnant women. Congenital blindness, deafness, heart defects, and mental retardation are the more frequent permanent damages seen in live-born infants of mothers infected with rubella during the early phase of gestation.

During the 1964 rubella outbreak in Maryland, approximately 3,600 cases were reported. An estimated 1,400 infants among the 70,000 born that year were significantly handicapped, physically or mentally or both, because of their mothers' infection during pregnancy.

To prevent an epidemic of this disease, anticipated in 1971, a vaccine is available for mass inoculation at the cost of about $1 for each individual inoculated. It will be necessary to inoculate 900,000 young children between one and twelve years of age. It is estimated that 100,000 children already have been inoculated by private pediatricians and through programs conducted by the local health departments for children in the first three grades. The remainder of the children will be reached before October 1 of this year. Immunization of children is expected to prevent transmission to adults, thereby protecting pregnant women.

In spite of remarkable advances in medical science during the past two decades, many degenerative conditions continue to defy prevention. In 1968, lung cancer claimed 1,163 lives, 947 were males and, with few exceptions, the deaths were attributed to cigarette smoking. Automobile accidents resulted in 874 deaths in Maryland, and many of these were associated with intoxication.

Continuous public education programs by the local health organizations will aim to prevent such unnecessary deaths from lung cancer and alcohol. Deterrent penalties, such as revocation of licenses and incarceration, will be used against drinking drivers. The former permissiveness which characterized the treatment of such drivers cannot be tolerated as long as alcohol is a significant contributing factor in traffic fatalities.

Most of the illness and resultant disability is increasingly associated with chronic diseases. Three broad categories of causes, of critical importance to public health and medicine, include behavioral disorders, mental retardation, and degenerative illness among the aged.

Significant behavioral conditions include maladaptive behavior in very young children, aggressive behavior among school children, juvenile delinquency, narcotic addiction, alcoholism, adult psychoses such as schizophrenia, and the confused behavior of the aged. Such diseases are costly and maintenance entails 7,600 beds in the state mental hospitals; 2,500 beds in the voluntary, teaching, or private hospitals; facilities for 1,300 juveniles in the institutions managed by the Department of Juvenile Services; and an unknown number of beds in the nursing homes devoted to caring for the elderly.

Services must be provided early in the development of emotional disorder in an attempt to control the cost and disabling effects of such disorders. This can best be done within the patient's community, and public expenditures for institutional care, which have risen to prohibitive levels, instead can be aimed at the enrichment of community resources for such care.

The extent of involvement in the community's affairs may necessitate an informed and aggressive interest in the housing, educational and recreational opportunities of areas with a high rate of juvenile delinquency; a concern with the sources of supply of

narcotics where a problem of drug traffic among high school children is found; and possibly an interest in the development of social service programs for the aged. The involvement must be expanded to meet the increasing problems of emotional illness.

Mental retardation which requires publicly funded medical services affects two out of every 1,000 persons, or 8,000 state residents. In addition to the existing facilities—Rosewood and Henryton—the Washington Metropolitan Mental Retardation Center is under construction, and will contain 500 beds for the care of mentally retarded patients. An Eastern Shore Mental Retardation Center will also be built in 1971.

In addition to these facilities, 34 community day-care centers for the mentally retarded, throughout the state, care for children who cannot be accommodated in the regular school system. Presently, 900 retardates are receiving the training which will enable them to reach a level of self-care and independence previously considered unattainable.

To cope with this increasing public health problem and to correct the serious shortage of facilities for the mentally retarded, the Directorate for Mental Retardation Services, a new major administrative unit of the Department of Health and Mental Hygiene, was activated on July 1, 1970. This unit will manage long-term institutional care; community-based day-care and residential care; liaison with the State Department of Education on special education for the mentally retarded; and research, demonstration, and preventive services. In addition, measures are currently being taken to correct the serious overcrowding at Rosewood State Hospital.

The heaviest burden of illness falls on the elderly, who currently occupy nearly 15,800 beds in extended care facilities, skilled nursing homes, intermediate care facilities, chronic disease hospitals, and the state mental hospitals.

Although the prevention of all degenerative disease in the near future is certainly impractical, the elderly person must be given the means to adjust to his disabling condition in a way which encourages a maximum of independence while he remains close to his family and community. Hopefully, more home health services will be developed, and efforts to enhance the social life of the aged will be stressed. This includes adequate housing, assistance in nutrition, and an accessible source of medical services.

In an attempt to improve the environmental health within the state, pollution control facilities are rapidly being constructed. Twenty sewage treatment plants are planned throughout the state which will be partially funded by the state. An area of concern is the Chesapeake Bay. Although many of its tributaries show evidence of heavy pollution, the main body of the bay is of high quality. Pollution control will be aimed at such areas as the upper Potomac River, the Potomac estuary, the shellfish estuaries of the Eastern Shore, the Baltimore harbor, and Back River, all polluted by sewage, industrial wastes, acid mine drainage, or bacteriological contamination. With the help of the state's sewerage grant program, construction of facilities in these areas will continue.

During the past two years, and perhaps for the first time in the state's history, the trend toward steadily increasing water pollution has significantly been reversed. With continued public support, water pollution throughout the state will be substantially reduced.

Maryland's air pollution problems are most severe in the major urban centers such as Baltimore and the Washington area, but localized problems exist in many other parts of the state. Although the air pollution control program is still in a developmental stage, substantial results are being achieved. Recent evaluations were made on the 100 largest sources of air pollution in the state, with the development of a schedule of actions to bring them into compliance with new state regulations. So far, 20 compliance plans have been submitted for state review, and five have been approved.

Less progress has been made in control of solid waste disposal pollution, although several of the largest open-burning dumps have been abandoned or converted into sanitary landfills. There are still many facilities which are inadequate.

In Maryland, both the monitoring and regulatory control of radiation and pesticides are being strengthened. It is essential that the state's administrators have the authority to make and implement decisions on the control of these pollutants because of the gravity of the potential public hazard. Noise control is another area under study.

Conclusion

The time has come to coordinate the large number of personal health programs and services which exist in the public, private and voluntary sectors. The individual, his family, and society generally are served poorly when these services are administered in such a way that they compete for manpower with no consideration for priority, when the economic circumstances governing reimbursement are determined by third parties removed from the patient-provider relationship, and when the convenience of the patient may be a minor consideration in accounting for the location, timing, and organization of services.

The Medicaid program in Maryland will provide an opportunity to point the way toward more effective integration of the diverse public investment in the health services for the 280,000 residents of Maryland who are either on public assistance or in severely depressed economic circumstances.

Disaccharide Intolerance:

A Review for Practicing Physicians

It is well recognized that some patients experience gastrointestinal symptoms following the ingestion of milk. The first description of this clinical entity appeared in the early 20th century and was termed "fermentative diarrhea". In recent years, this syndrome has been clearly defined, with special emphasis on the pathophysiological features of this common problem.

Like many malabsorptive states, sugar intolerance has been abusively incriminated by some and totally rejected by others. Countless authors have investigated this syndrome and voluminously published their findings. It was felt that a review of the present concept of sugar intolerance would be of value to the practicing physician in his daily contact with patients.

It is the purpose of this paper, therefore, to review disaccharide intolerance with clinical pathophysiologic clarification and dietary management.

Carbohydrates: Digestion and Absorption

Disaccharides and polysaccharides are the main sources of carbohydrates in natural foodstuffs. Disaccharides, as found in milk and milk products, provide approximately 35% of total carbohydrate intake. Polysaccharides, such as starch and dextran, yield the remaining 65%. In most instances, carbohydrates can be transported across the intestinal epithelium only as simple sugar or monosaccharide.[1-3] It is estimated that approximately 85% of total carbohydrate intake is composed of "other sugars", which require various molecular alteration prior to absorption.

Digestion begins in the oral cavity with mastication and the mixing of salivary amylase. The enzymatic role of salivary amylase in overall carbohydrate digestion seems relatively minor. Minimal or no additional sugar digestion is encountered until the food is exposed to pancreatic enzymes. Even after exposure to pancreatic enzymes, the resultant succus entericus contains a mixture of monosaccharide, disaccharide, and polysaccharide. At the present time, an isolated monosaccharide transport deficiency is not recognized in the absence of such overt intestinal anatomical distortion as seen in extensive regional enteritis,[4] celiac disease (gluten sensitive enteropathy), or extensive small bowel resection.[5] Likewise, defects in the intestinal intraluminal phase of digestion are not recognized for carbohydrates containing

From the Department of Medicine, St. Joseph Hospital, Towson

more than two monosaccharides, that is, polysaccharides. Therefore, our present understanding of sugar intolerance, as a clinical entity, is limited to the maldigestion of disaccharides.

The digestive process of disaccharides, for the most part, occurs during the intraluminal intestinal passage and is termed the intraluminal phase of digestion. This final phase of carbohydrate digestion is relegated to specific enzymes, disaccharidases. The greatest concentration of disaccharidase activity occurs in the micro villi of the matured intestinal epithelial cells (Figure I). It is felt that these enzymes are not secreted into the lumen of the intestine, but are confined to this anatomic cellular location, and are not only important in digestion but also initiate the first step in transepithelial disaccharide transport.[3] It is the failure of this intraluminal digestive phase of carbohydrates and concomitant failure of transport initiation which is responsible for the sequence of events manifested by patients suffering from "fermentative diarrhea" of disaccharide intolerance. As seen in other clinical expressions of enzyme deficiencies, disaccharidase deficiency may be either total or partial. The result is reflected as either complete or partial disaccharide intolerance. An acquired form of disaccharide intolerance may occur when the cellular "turnover rate" is greatly enhanced, resulting in the appearance of immature epithelial cells at the absorptive surface, as in celiac lesions and other small intestinal inflammatory lesions (Figure II). An acutal deficiency is demonstrable in this group of diseases which should not be confused with allergic modalities.

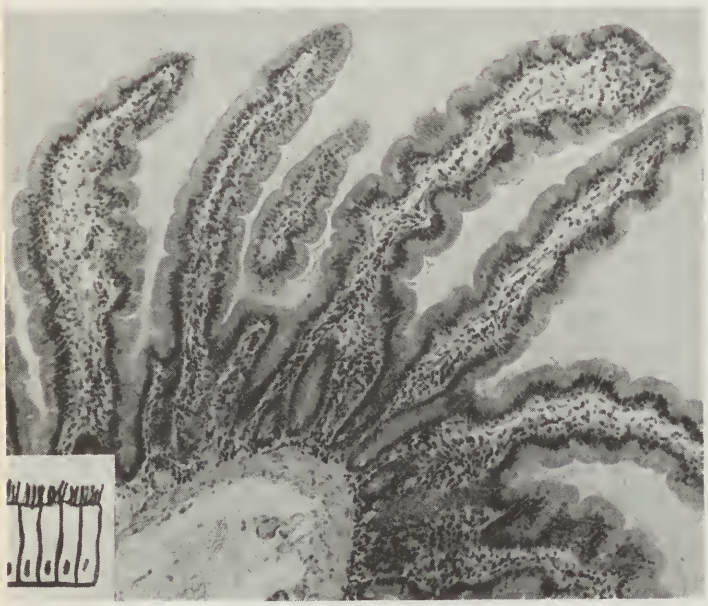

Figure I: Normal small bowel biopsy, showing a mature epithelial cell containing disaccharidase in the micro villi

Figure II: Abnormal small bowel biopsy (celiac) showing immature epithelial cell without micro villi, disaccharidase deficient

These enzymes (disaccharidases) have been isolated and classified by Dahlqvist.[6-8] They include lactase, sucrase, trehalase, and several maltases. In man, all intestinal disaccharides are highly developed at birth, or shortly thereafter, and for the most part are concentrated in the jejunum and ileum. Lower concentrations are found in the duodenum, but none in the stomach or colon.[9] The highest concentration is present in the jejunum and proxymal ileum, as distribution of disaccharidase concentration activity has been shown in normal subjects (Figure III).

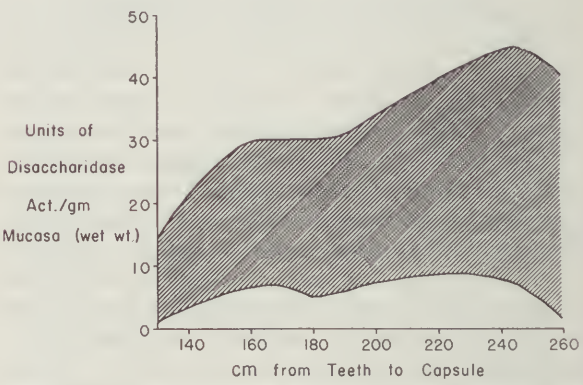

Figure III: Distribution of disaccharidase activity in normal subjects at various levels of the small bowel

The mechanisms that produce "fermentative diarrhea" occur as a result of nonabsorption of the disaccharide, causing intraluminal fermentation. The product of this intraluminal fermentation by the bacterial flora of the gastrointestinal tract has been described as noxious and irritating. The latter results in altered motility, absorption, and reflux of fluid into the intestinal lumen.[10, 11] This hypothesis is diagramatically shown in Figure IV.

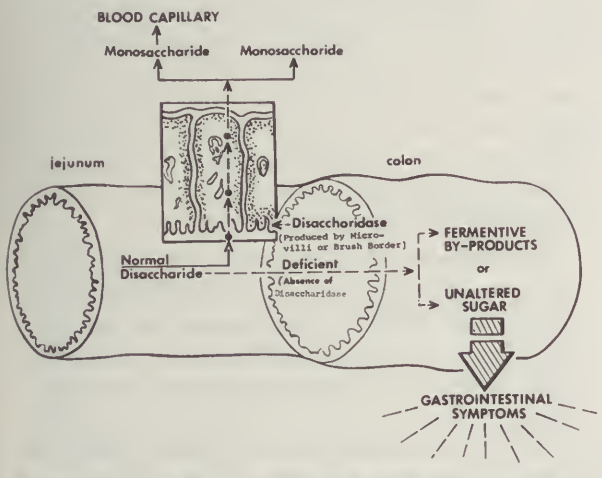

Figure IV: Normal and abnormal disaccharide absorption, resulting in altered absorption, motility and reflux of fluid into the intestinal lumen

Clinical Manifestations

Clinical manifestations presented by patients with disaccharide malabsorption due to intestinal disaccharidase deficiency may be congenital or acquired. The symptomatology and chronological occurrence vary with the age of the patient.[12, 13] Dietary habit in each age group determines the severity or cessation of symptoms. The mainstay of the diet in infancy is disaccharide; and since infants with disaccharidase deficiency have no means of rejecting this offending element, they will present with chronic, watery, acid diarrhea, dehydration, and malnutrition. The latter usually results in more vigorous feeding attempts and further malnutrition. If not recognized, this will eventually lead to death. In some cases, spontaneous regression of symptoms has been observed during the fourth, fifth, and sixth years in children afflicted with congenital disaccharide malabsorption. Since the small bowel surface area increases, the hydrolizing capacity is enhanced even though the total enzyme concentration per gram of small bowel tissue remains unchanged. In addition, it is also obvious that the disaccharide load offered at this age is less than that of infancy.

Diagnosis

The physician should consider the existence of disaccharide malabsorption in his differential diagnosis in every case of chronic diarrhea, especially when persistently acid pH stools occur in infants and children. In adults, an evaluation for lactose malabsorption is indicated in all cases with a history of milk intolerance and in cases of intermittent diarrhea accompanied by vague abdominal symptoms, even if the patient's history is not suggestive of milk intolerance.

There are three ways to prove disaccharide intolerance:

1. Feed the patient a large amount of the disaccharide and observe for production of symptoms.
2. Feed the patient lactose and determine whether the blood sugar can be raised by ingestion of disaccharides.
3. Assay the enzyme activity of the intestinal mucosa from a biopsy sample.

The Lactose Tolerance Test has been used widely to detect lactase deficiency.[14-17] This test is defined in terms of the blood glucose response to an oral lactose load. The reader is reminded that lactose is a disaccharide which yields glucose and galactose. Absorption of lactose is dependent on the enzymatic hydrolysis by the enzyme, lactase. The result is the appearance of glucose and galactose in the blood stream, producing a rise in blood sugar. It is generally accepted that 100 gm of lactose ingested orally will produce a 20% rise in the blood sugar concentration during a two-hour period of observation. Blood sugar levels are determined at 0, 20, 40, 90, and 120 minutes.

The final diagnostic step may then be the actual determination of disaccharidase activity in the small bowel mucosa. Such determinations are not routinely necessary for the substantiation of a "strong clinical suspicion and positive abnormal tolerance test". In instances associated with multiple disaccharidase deficiencies requiring severe limitation in dietary restriction, the ease and availability of the small intestinal mucosa for biopsy makes such a procedure advisable. Listed in Table I is a didactic classification of presently well-organized disaccharide malabsorption syndromes.

Table I: Syndromes of Disaccharide Malabsorption

I. Congenital:

1. **Congenital lactose malabsorption without lactosuria (Holzel Syndrome)**
2. **Congenital lactose malabsorption with lactosuria (Durand Syndrome)**
3. **Congenital sucrose malabsorption**
4. **Congenital sucrose-isomaltose malabsorption**

(Table I continued next page)

II. **Acquired or Secondary:**

1. **Acquired lactose malabsorption in adults**
2. **Primary malabsorption syndromes (Celiac disease, Idiopathic sprue, Tropical sprue)**
3. **Secondary malabsorption syndromes (Whipple's disease, Intestinal lymphoma, Intestinal lymphangiectasia, Abetalipoproteinemia)**
4. **Blind loop syndrome**
5. **Kwashiorkor**
6. **Acute gastroenteritis or Enterocolitis**
7. **Giardiasis**
8. **Mucoviscidoses**
9. **Regional enteritis**
10. **Extensive bowel resection**
11. **Peptic ulcer**
12. **Ulcerative colitis**
13. **Irritable colon syndrome (some cases)**
14. **Diverticulosis and diverticulitis of the colon (some cases)**

Discussion

In the past, a great deal of attention has been focused on the protein fraction of milk which was thought to act as an antigen and established the basis for an "allergic reaction". This allergic phenomenon may play a role in some children, especially those with eczema and other allergic manifestations; however, most patients who manifest bloating, cramps, and diarrhea with milk ingestion do not demonstrate atopic or other allergies.

Lactose intolerance (milk intolerance) is the only form of acquired disaccharidase deficiency found to be clinically significant in adults. In the adult patient it seems the quantity of milk taken during a single feeding is important.[18] The small amount of milk ingested in cream sauces or coffee may be tolerated without symptoms. This intolerance to larger amounts of milk is occasionally recognized by the patient who may take advantage of this intolerance and use milk therapeutically for catharsis. On occasion, milk intolerance is not appreciated by the patient until he is introduced to such dietary programs as those used in the treatment of peptic ulcer or other acid diathesis, whereupon chronic diarrhea develops, adding to the patient's discomfort. Such patients usually experience the onset of abdominal pain or cramps or both within 30 minutes after drinking milk. This is then followed by bloating, flatulence, and explosive odoriferous, watery stool within two hours.

The time sequence of onset of symptoms observed in patients ingesting lactose, who are lactase deficient, raised the suspicion that the exact pathophysiological mechanism presented in Figure III may indeed be oversimplified. Many have raised questions concerning the direct effect of lactose on the neuromuscular mechanism of the small intestine. At this time, such suspicions are purely hypothetical since no objective evidence is available to support or deter such thinking. Similarly, no evidence is available to explain the alleviation of erratic colon motility and, consequently, the symptoms seen in "the irritable colon syndrome", when milk is eliminated from the diet.[4, 18]

Certainly it appears that disaccharidase deficiency can occur as a genetically inherited trait. This observation is strengthened by familial and geographic patterns of distribution. Further, important racial differences have been demonstrated.[19, 20] In one study, 70% of the Baltimore Negro population was found to manifest lactase deficiency. This is contrasted to a 5% to 10% deficiency occurrence rate in a similar Caucasian population.[20] Similar results have been found in African populations. This marked racial difference in the incidence of lactase deficiency strongly suggests that the level of enzyme activity is genetically controlled and favors a genetic etiology for disaccharidase deficiency.

The question interposed on this genetical disposition is one of adaptation to decreased milk ingestion seen in adulthood.[20] It was recently demonstrated that patients exhibiting intolerance to maltose and sucrose could be made to tolerate these sugars when administered in progressively increasing doses. These authors not only demonstrated increased clinical tolerance but also showed increased maltase and sucrase enzyme activity in the intestinal epithelium. The latter study is the first demonstration of adaptive intestinal enzyme activity to date.

Treatment

The incidence of disaccharidase deficiency, where carefully studied, seemed of the magnitude that its presentation to the practicing physicians is likely.[3, 20-23] The physician confronted with such a problem will find himself in an area of dietetics which indeed may be uncomfortable. The following list is offered for dietary identification.

For infants:

1. Do not contain lactose but contain maltose, isomaltose, and sucrose
   - A. Sobee (Mead Johnson)
   - B. Prosobee (Mead Johnson)
   - C. Soybeans (Loma Lema) Boston style
   - D. Soybeans (Loma Lema) Tomato sauce
   - E. Ruskets (Loma Lema)
   - F. Soyagen, Carob. (Loma Lema)
   - G. Soyagen Infant Powder (Loma Lema)
   - H. Gravy Quik (Loma Lema)
   - I. Jell Quik (Loma Lema)
   - J. Soyagen, all purpose (Loma Lema)
   - K. Soyagen, liquid (Loma Lema)
   - L. Soyalac, concentrated liquid (Loma Lema)

2. Contain no lactose but contain sucrose
   A. Isomil (Bordens)
   B. Mull-soy (Bordens)
   C. Neo-Mull-soy (Bordens)
3. Contain no lactose
   A. Gerber M B F
   B. Lambase (Gerber)
4. Contains very little lactose but contains sucrose
   A. Nutramigen (Mead Johnson)
5. Contains less than 0.5% carbohydrates
   A. CHO-free Formula Base (Bordens)

For adults, since lactose intolerance is the most common adult and acquired form of disaccharidase deficiency, all one needs to exclude from the diet is milk and milk products. It is often wise to remind patients that milk products include cheese, cream sauces (salad dressing), ice cream, puddings, custards, and dessert toppings. There are presently two known lactose-free milk substitutes. They are "Dairy-Rich" and "Kool-Whip". All other powder milk products contain lactose.

Murine Typhus:

Recent United States Surveillance and Report of an Unusual Case

The reported incidence of murine typhus (typhus fever) in the United States has been declining almost steadily for the past 15 years (Figure 1). Pratt [1] reviewed the changing picture of murine typhus in the United States as of 1956 and discussed the factors, including improved sanitation, that were most likely responsible for the decline in reported cases. Since 1956, the downward trend has continued, with 52 cases reported in 1967. As in 1956, more than half of the total cases for the United States were reported from Texas (Figure 2); none were reported from Maryland. The following case, which is the only one reported from Maryland in 1968, is presented as a reminder that murine typhus still occurs in the United States and may pose a difficult diagnostic problem, particularly when rash is not present.

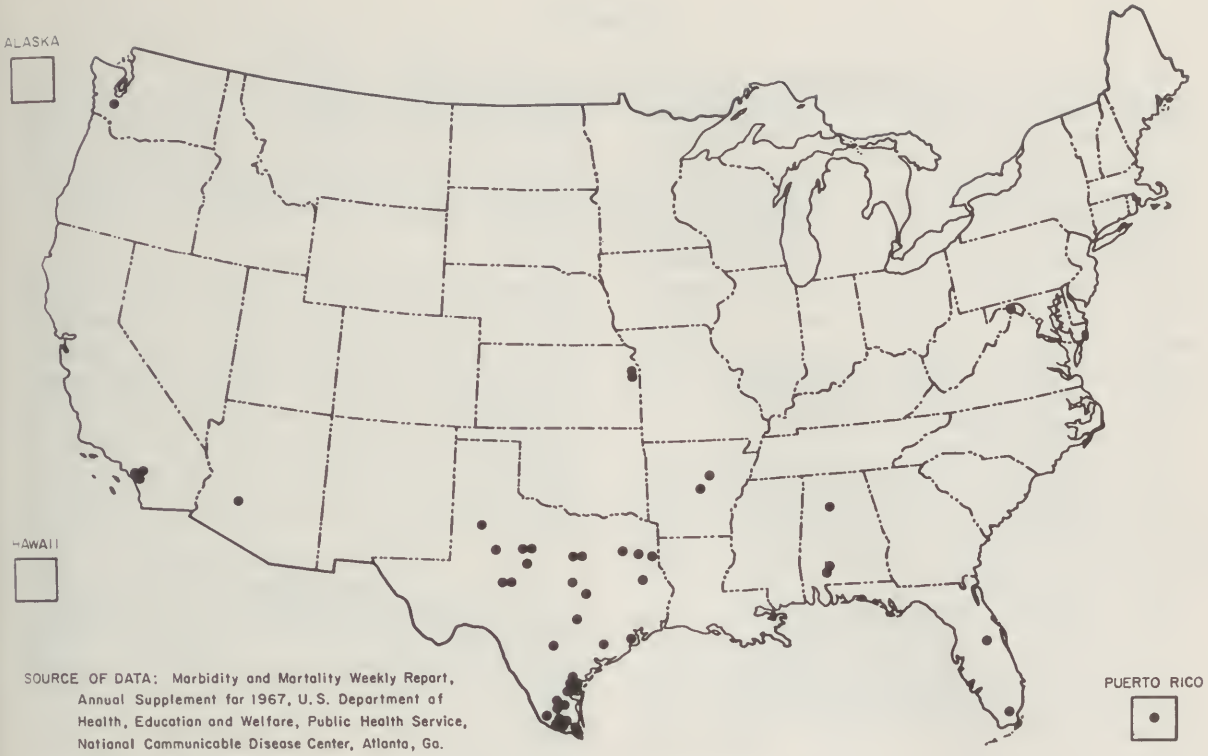

Figure 2

Case Report

The patient, a 28-year-old merchant seaman, was admitted to the Church Home and Hospital in Baltimore on August 30, 1968, with the chief complaints of fever, chills, anorexia, headache, and malaise.

He had been in good health until 11 days before admission, when en route from Mazatlan, Mexico, to Baltimore, he began having a severe headache and fever of 104°F. He arrived in Baltimore two days later and, because of the persistent headache and fever, went to a clinic. Albuminuria and flank pain were found, and his illness was diagnosed as urinary tract infection. He was treated with 2 gm of sulfisoxazole *(Gantrisin)* a day.

Seven days later, he returned to the clinic because of persistent headache. A diagnosis of an influenza-type illness was made, and aspirin was prescribed. The sulfisoxazole was stopped at this time. Three days later, due to persistent symptoms, he visited a private physician who arranged admission to the hospital.

Physical examination on admission revealed a temperature of 101.5°F, pulse rate of 88 beats per minute, blood pressure of 130/80 mm Hg and respiratory rate of 18 per minute. There was pharyngeal injection and dullness with crepitant inspiratory rales at the left lung base. The remainder of the examination was unremarkable. *There was no skin rash.*

The hematocrit level was 50%; leukocyte count was 12,300/cu mm with 28% polymorphonuclear leukocytes, 29% bands, and 43% mononuclear cells; urinalysis was normal; BUN was 14 mg % and FBS was 107 mg %. Chest X-ray showed evidence of consolidation at both lung bases, but a sputum culture revealed normal flora. Febrile agglutinins for typhoid, paratyphoid, and brucella were negative, but a Proteus X-19 titer was 1:320. A repeat Proteus X-19 titer on serum drawn four days after admission was 1:1,250. Because of the high titers, rickettsial infection was suspected, and complement fixation tests using various rickettsial antigens were performed. The results are shown in Table 1.

TABLE 1: Results of Complement Fixation Tests*

ANTIGEN	C. F. TITER 9/3/68	9/9/68
Murine Typhus	1:32	1:128
Rocky Mountain Spotted Fever	<1:8	<1:8
Q-Fever	<1:8	<1:8

** Maryland State Department of Health Bureau of Laboratories*

Discussion

In retrospect, this patient had many of the well described signs and symptoms of murine typhus including anorexia, malaise, headache, fever, albuminuria, and evidence of respiratory tract involvement.[2, 3] The age, race, and sex of the patient were also typical.[2] However, due to the present rarity of murine typhus in the United States and the absence of a skin rash, which is present in 64% of untreated cases,[2, 3] the correct diagnosis was not suspected until the elevated Proteus X-19 titer was noted. The diagnosis of murine typhus was confirmed by the fourfold CF antibody titer rise and the high fluorescent antibody titer.

Since the usual incubation period of murine typhus is eight to twelve days,[2] and the patient had been at sea for ten days prior to onset of symptoms, he probably contracted typhus by contact with an infected Mexican flea in Mazatlan.

The recommended treatment of murine typhus in adults is 2 to 3 gm chloramphenicol orally a day, or 1.5 to 2 gm tetracycline orally a day.[4] An adequate course of therapy, at least until the patient has been afebrile for 48 hours, is necessary lest clinical relapse occur.[5]

Based on the CF results and an indirect fluorescent antibody titer of 1:80 to murine typhus on the September 9 serum specimen, a diagnosis of murine typhus was made. The patient was treated with 2 gm of tetracycline daily for ten days, and he made an uneventful recovery.

Closer questioning of the patient revealed that his ship had left Mazatlan 21 days prior to his admission to the hospital, and that the rat population near the docks in Mazatlan was quite high.

Investigation by the U. S. Quarantine Service revealed that sanitary conditions aboard the ship were excellent with no evidence of rodent infestation, that no other members of the ship were ill with similar symptoms, and that murine typhus is endemic in Mazatlan.

Attention has recently been drawn to the risk of laboratory-acquired typhus.[6] There are data [7] to suggest that Rickettsia mooseri exists in nature in a number of wild animals including rats. Smadel [8] has predicted that naturally acquired murine typhus will continue to occur in the United States at about the present level. Therefore, physicians should remain alert to the possibility of murine typhus, especially in patients coming from areas where the disease remains endemic.

The Role of Computers in Electroencephalographic Analysis

ANTONIO STAZIO, MD
Chief, Neurology Service
Saint Elizabeths Hospital
Associate Clinical Professor of Neurology
George Washington University Medical Center
Washington, D.C.

Over the past two decades, during which the computer has become an increasingly popular tool in scientific research, much work has been undertaken in the general field of computer assisted diagnosis. To this end, however, the complexities of the problem have not permitted any great advances: A breakthrough, in fact, has occurred only in one specific area—electrocardiography (EKG).

The EKG, which is an electrical correlate of the heart beat, is probably the simplest pattern used in medicine. Because of the apparent simplicity of the patterns, and because of the frequency of cardiovascular disease in the community, together with the very high volume of EKG recordings made daily, every incentive has been present to investigate methods of increasing accuracy of interpretation and speeding up processing. In spite of these incentives, final development of adequate procedures has taken over eight years. It will probably be another four or five years before routine use of computers to process EKGs becomes accepted. The methods of analysis are relatively sophisticated,[1] but permit near real-time processing with telephone linkage to a central computer. The economics of this method of EKG analysis appear to be quite competitive with human interpretation.

Two other important interpretative laboratory procedures are the X-ray and the electroencephalogram (EEG). Attempts are being made in many centers to digitize the X-ray film, normalize the outlines of the X-ray, and correlate the normalized picture with other patterns held in the computer memory. It takes little imagination to realize how difficult the process can be.

Computer analysis of the EEG has been studied very intensely in many centers throughout the world.[2] The EEG, popularly known as "brain waves", is the time-varying voltage observed between two electrodes contacting separate points of the head, typically two points of the scalp. Contact resistances between such electrodes are usually a few thousand ohms, and 20 to 100 microvolts of signal are usually obtained. The predominant frequency range is from 0 to 30 cycles per second, although some energy is present at considerably higher values. In the case of an awake subject with closed eyes there is often a well-defined peak in the frequency spectrum near ten cycles per second which disappears when the eyes are open. This frequency component is the well-known "alpha rhythm". It is particularly prominent if the electrodes are near the back of the head. Considerable variation in the character of the signal may be observed under differing experimental conditions for a given subject, and between individual subjects. For example, some individuals show almost continuous trains of alpha activity. Some exhibit frequent bursts of such activity, some infrequent bursts, and some exhibit no discernible alpha activity at all. The waves during sleep are considerably different than those during wakefulness, and there are different EEG patterns during the different stages of sleep. Furthermore, various drugs are known to interfere with the EEG pattern, and many diseased conditions of the brain show abnormal characteristics. As a result of these facts, EEG has become widely used in clinical neuro-

physiological work as an aid to the diagnosis and treatment of a variety of disorders. In this work, however, the main tool of EEG classification and interpretation is the eye of the experienced clinician observing the data directly as recorded by an ink writer. In fact, it is the clinician's function, in his evaluation of the EEG tracing, to mentally filter out the "background noise" and the artifacts of various nature and origin, and to select the elements which he considers significant and conducive to a meaningful diagnostic correlation.

In addition to all the other variables which may affect the EEG pattern and, therefore, the interpretation of the record, such as the psychologic, physiologic, and pathologic state of the subject under study, extremely important are the complex human variables intrinsic in the physician reading the tracing, such as the training, experience, alertness or fatigue, and emotional bias. When studies have been made of the degree of accuracy and consistency in the visual interpretation of the EEGs, it was found that there is a reasonably good agreement among different electroencephalographers only on the most marked abnormalities, and that there is a surprisingly wide difference of opinion in the interpretation of some of the tracings. What is even more disconcerting is that there is often disagreement between the individual observer's first interpretation and his later reclassifications of the same tracing.

In contrast to this, it is obvious that a form of automatic analysis is devoid of all the individual and day-to-day variations which are inherent in any type of human endeavor.

Because of these considerations, and even before the advent of electronic computers, there were many electroencephalographers who realized that theirs was a field greatly in need of some form of automatic analysis and, in the late thirties, attempts had already been made to design an instrument for this purpose.[3] One of the earliest approaches was to explore the EEG in terms of Fourier analysis, by which original complex and seemingly irregular waveforms, such as the EEG tracing, are decomposed in their basic, highly regular and rhythmic waveforms. A number of parameters of these basic waveforms can then be determined and measured with mathematic accuracy, and these are the voltage or amplitude of the individual waves, the frequency, or number of waves per unit of time, and the phase, or time relations of different parts of a wave as recorded simultaneously in different tracings. The determination of amplitude versus frequency ("spectral analysis") is the most popular form of EEG analysis today which can be carried out automatically with the help of commercially available, reasonably inexpensive instruments. A number of research and clinical EEG laboratories are now equipped with such instruments.

As the electronic computers become more accessible to the researcher and to the clinical investigator, it was realized that a tool was now available to achieve greater accuracy and speed in measuring the amplitude and frequency of the EEG waveforms and to perform complicated mathematical analyses which would be prohibitively time-consuming, and also liable to additional error if done by hand. It was further envisioned that the result of the automatic computation could then be printed out in any desired detail with some of the common measurements and the final interpretation reported. The results of the analysis could then be stored in computer memory along with information derived at a later time about the final diagnoses and outcome, so that probabilities could be derived for each diagnosis.

With the increase in sophistication on the part of the clinical investigators, objections to this approach became apparent. The automatic analyser available today gives only part of the information present in the original EEG tracing. During the process of automatic analysis, in fact, a large amount of information essential to the physician in his diagnostic interpretation of the record is filtered out and irretrievably lost. Lost is the information about the occurrence of transient potentials, which are essential for the diagnosis of epilepsies; lost also is all information about phase, which is often indispensable for the exact localization of lesions such as brain tumors. A further serious limitation of any automatic analyser is that it cannot recognize and compensate for the large varieties of artifacts which the experienced electroencephalographer has learned to identify and evaluate in their proper context. Muscle artifacts, sweat artifacts, movement artifacts, such as eye blinking, false signals originating from faulty electrodes and connections and from errors of the EEG machine itself or the EEG technician or both would all be accepted by the analyser and by the computer as genuine "brain waves" and treated as such.

Furthermore, if one realizes that up to 10,000,000 bits have been calculated to be necessary in describing one full EEG record in binary form, it becomes quite apparent that the handling by the computer of this information, already defaced and mutilated in the process of being analysed, is now clearly uneconomical. The futility of this approach is further emphasized if one realizes that a very large, very high speed computer could take hours to calculate frequency distributions and correlations from the amount of data contained in any single, routine EEG recording.

As an alternative to this form of computerized EEG analysis, other investigators are approaching the problem by experimenting with computer techniques for the study of patterns in the EEG ("pat-

tern recognition system").[4] By this method individual EEG patterns, believed to carry specific diagnostic connotations, are predetermined by a group of common properties which they possess. A pattern recognition system has the means to compute the values of a number of parameters from incoming data. The incoming values are then compared continually with various groups of parameters and their values which had previously been stored in the computer memory. If agreement occurs between one of the incoming groups of parameters and one of the stored groups, an instance of the pattern, corresponding to that group of parameters, is said to exist.

The main problem to be faced here is one of preselection, definition, and classification of the patterns later to be recognized by the computer. Here, once again, it is disconcerting to realize how little agreement exists among physicians on the definition and the diagnostic significance of some of the patterns observed in the EEG. While fairly uniform agreement exists in the definition of descriptive terms such as "alpha", "beta", and "delta" waves, "spike-and-wave complex", etc, the significance or the definition, or both, of other patterns such as "dysrhythmia", "14-and-6-cycles-per-second positive waves", "K-complex", etc, are still very controversial.

The systems of computer assisted EEG analysis reported above are still in the very early experimental stage. Projecting to the future the pace of current advance in this field, it seems obvious that ultimately, although the computer will become a tool used in EEG analysis, the amount of research work necessary to establish it as a necessary and economic device is likely to be measured in decades. A major accomplishment, however, has already been made, and this is to have brought to mind, to those of us in need of such reminder, that electroencephalography, in spite of its impressive achievements, is far from being an exact science and is still very much of an "art". We are still looking for the right questions to ask and often find ourselves wondering what question the EEG is an answer to. Until we have learned to better define our terms, sharpen our definitions, and to formulate more precise questions, no computer can be expected to properly substitute the man in his mysterious process of analysis called intuition.

Treatment of a Highway Accident Victim

STUART V. GRANDIS, MD
University of Maryland Hospital

This patient is a 21-year-old Negro man who was admitted on Christmas Day to Easton Hospital in a comatose state immediately following a highway accident. Skull films were unremarkable. He had a right femoral comminuted fracture, a right acetabular fracture, and fractures of both first ribs. Because his hematocrit dropped from 40% to 29%, he was transfused with seven units of packed cells. He was given tetanous toxoid, was started on penicillin, and underwent debridement of his open wound with insertion of a tibial pin for skeletal traction. Although consciousness slowly returned, his BUN rose from 18mg% to 122mg%, while his urine output dropped to less than 300 cc per day. Mannitol infusions proved ineffective.

On December 30, five days after his initial injury, the patient was transferred to the University of Maryland ward medical service with diagnoses of acute multiple trauma, post concussion syndrome, and acute renal failure.

Initial laboratory data revealed a normal hemaglobin, a white cell count of 19,750, serum potassium of 6.4 meq/1, and a BUN of 128mg%. By the following day, his BUN had risen to 180mg%, and the serum potassium had risen to 8.6meq/1. The patient was treated with parenteral fluid restriction, rectal administration of powdered sodium polystyrene sulfonate (*Kayexalate*), potassium exchange resin, and peritoneal dialysis through the usual temporary catheter. He was also started on a broad-spectrum bactericidal antibiotic (*Keflin*). His BUN dropped to approximately 140mg%. Subsequently, because of the expected prolonged nature of his illness, a "Barry" pericannula, semipermanent peritoneal catheter was inserted through a small laporotomy and the patient was dialyzed intermittently through this device. His BUN was maintained in the range of 140mg%. Dialysis was performed during the day, and at night the cannula was closed and dialysis was stopped so that the patient could sleep. Because of an unexplained arterial PO_2 of 39 mm of mercury, it was hypothesized that the patient might be throwing emboli to his lungs; however, this could never be substantiated.

On the morning of January 3, he experienced a transient episode of atrial fibrillation, and that evening he experienced an abrupt episode of severe respiratory distress compatible with pulmonary embolization or pulmonary edema, or both. He was intubated and started on a dehydrating 4% dialysis solution. Later that evening, a tracheostomy was performed.

On January 9, two weeks after his initial injury, he spiked a fever. A greenish exudate was noticed around the cannula site, and the cultures of the dialysate grew Pseudomonas. Subsequently, Aerobacter was grown from the blood. The patient was started on small doses of colistin. Several days later his temperature returned to normal and the cultures became negative.

By January 14, his urine output had risen to 600 cc per day. Five days later, it had increased to 2½ liters per day. Following this, the patient entered a prolonged diuretic phase and excreted as much as 8½ liters of urine per day. By January 27, 32 days after injury, his BUN was within normal limits. During this period, fluid and electrolyte losses were replaced and the patient was kept on a high carbohydrate, high fat diet.

On January 30, his tracheostomy was closed and his parenteral fluids entirely discontinued. He was transferred to the orthopedic service, and on February 20, 56 days after injury, he was placed in a spica cast and subsequently discharged.

* *The following two articles, a case presentation and discussion of the case, are from a session of Medical Grand Rounds presented during the Faculty's 1969 Annual Meeting.*

Acute Renal Failure

Acute renal failure is usually a temporary and potentially reversible suppression of renal function. Proper management demands thorough knowledge of the natural history of the disease. With such knowledge, fluids and electrolytes may be intelligently prescribed. Application of modern concepts has contributed to reduction of mortality rates, from about 90% prior to 1950 to about 30% today. This presentation will review the natural history of acute renal failure and illustrate therapeutic principles as they pertain to the presented case.

GLENN D. LUBASH, MD
University of Maryland Hospital

Acute renal failure can result from prerenal, renal, or post-renal causes. Dehydration in its early stages is an example of a prerenal etiology. The renal causes are acute tubular, medullary, and cortical necrosis. Of these, tubular necrosis (formerly called lower nephron nephrosis) is the most common. Obstruction to urinary flow is post-renal.

Oliguria is defined as a urinary volume of less than 400 ml per day, but if measurements are made on a 24-hour basis only, then transient oliguria lasting a few hours may go unrecognized; patients may present in the early diuretic phase with a rising blood urea nitrogen. Hemodialysis and peritoneal dialysis are most frequently performed during the oliguric phase, but at times may be necessary in the early diuretic phase. The early and late diuretic phases have different therapeutic implications. If the patient is successfully maintained through the diuretic phase, he will enter a recovery phase which may last for six months to a year. During this time, the patient will appear well and blood urea nitrogen will be normal, but more precise tests of renal function may reveal abnormalites. At the end of the recovery phase most

patients will show normal renal function. Some patients, however, are left with documentable abnormalities of renal function, though these are usually minimal.

Most precipitating causes of acute renal failure have as the common denominator a decrease in renal blood flow and glomerular filtration rate which leads to renal ischemia. Some toxins (ie, carbon tetrachloride) directly produce renal tubular cell damage. In either case, the pathogenesis of acute tubular necrosis is obscure. Mannitol and the rapidly acting diuretics, ethacrynic acid and furosemide, are used in oliguric states in the hope that renal damage may be prevented. Their mechanism of action is again uncertain, and attributing efficacy to maintenance of renal blood flow is probably an oversimplification.

There were several possible causes of renal ischemia and acute tubular necrosis in the case presented. First, there was hemorrhage into the area of trauma in the right hip with a concomitant drop in hematocrit and probably decreased blood volume. Second, the trauma *per se* may have been associated with hypotension and renal ischemia. Third, there was the possibility of hemolysis due to a transfusion reaction from one of the several transfusions the patient had received. At one point, his urine was dark, and this raises the possibility of a fourth cause—myoglobinuria from muscle injury.

In the oliguric phase, the three main causes of death are electrolyte imbalance, chiefly hyperkalemia with cardiotoxicity; congestive heart failure; and uremia. Treatment is aimed at prevention so that the patient can be sustained until diuresis occurs. To avoid hyperkalemia, this patient was managed in the usual way with a potassium-free diet, ie, protein-free. Initially, this was limited to parenteral fluids containing glucose. On this sort of regimen it is also possible to add oral or parenteral fat supplements. Using only carbohydrates and fats, it is important to administer at least 800 calories daily for the protein sparing effect, as this will mitigate tissue breakdown and the consequent release of potassium from cells into extracellular fluid. More liberal diets may be given if more frequent dialyses are performed.

Infusion of glucose and insulin will promote transfer of potassium from extracellular to intracellular sites. This treatment is usually reserved for life-threatening cardiotoxicity and was not necessary in this case. Other electrolyte abnormalities frequently seen in prolonged oliguria—acidosis, hyponatremia, and hypocalcemia—will promote the egress of potassium from intracellular sites to extracellular fluid and will potentiate potassium's cardiotoxic effect. For this reason, severe acidosis should be prevented by giving sodium bicarbonate orally when the carbon dioxide combining power falls to about 17 or 18 mM/l or the blood pH to about 7.30. In emergencies with electrocardiographic manifestations of hyperkalemia, hypertonic sodium bicarbonate, saline, or calcium solutions may be given intravenously to reverse hyperkalemia. Because these solutions are hypertonic, they may precipitate pulmonary edema by pulling fluid into the intravascular compartment. The risk is worth taking if potassium's cardiotoxic effect is life threatening and, if reversal is achieved, cardiac function may be improved.

Some resins will exchange sodium for potassium and remove the latter ion from the gastrointestinal tract in patients who cannot excrete it in the urine. One such resin, a sodium polystyrene sulfonate (*Kayexalate*) is particularly effective. It may be given in 40 gm quantities in a retention enema once or twice daily, as used in this patient. It may also be administered orally in water, usually 10 gm two to four times daily.

Peritoneal dialysis or hemodialysis will correct all electrolyte abnormalities simultaneously. If dialysis is required for electrolyte abnormalities alone, however, it signifies failure of medical management. It should be possible through intelligent use of diet, resins, and other electrolyte manipulation to prevent hyperkalemia from threatening life.

Anabolic steroid hormones have been used to delay tissue breakdown but good documentation of their salutary effect is lacking.

In former days, the chief cause of death in oliguria was congestive heart failure. This resulted from the incorrect estimate of insensible fluid losses at about 1 L a day rather than about 500 ml under basal conditions. In planning daily replacement therapy, urinary and other losses are measured and added to estimated insensible loss. For example, if urine volume is 200 ml in 24 hours and insensible loss is estimated at 500 ml, water requirements for the day would be 700 ml. Since it is impossible to guess insensible losses precisely and since it is difficult to maintain patients on a protein-free diet in positive caloric balance, weight loss of approximately ½ lb per day is expected. If weight is maintained at a constant level, fluid retention must inevitably occur. The daily weight is the most important datum in management of patients with acute renal failure. If congestive heart failure does occur digitalis may be given, but the dosage should be decreased because of impaired excretion. In critically ill patients, dialysis may be used to remove fluid, but again, if it is necessary for this indication alone, it represents failure of medical management.

Unfortunately, the patient presented did have pulmonary edema, and a contributing factor was the inability to obtain weights. He was in traction and a scale for the entire bed was not available. He was undoubtedly overhydrated during the oliguric phase, and dialysis was necessary to reverse the process. The overhydration also changed the course of the diuretic phase.

Uremia is the last major cause of death in oliguria. Though many investigations have been performed to identify a uremic toxin or toxins, precise characterization has been difficult. Uremia is certainly more than electrolyte imbalance, since patients can have normal electrolyte values and still have all of the concomitants of the uremic syndrome such as coma, convulsions, gastrointestinal bleeding, etc. Patients may die in perfect electrolyte balance. It is certainly more than urea *per se* because patients dialyzed against a bath fluid containing urea may still improve though blood urea is unchanged. Empirically, dialysis will remove low molecular weight toxins and will help to keep patients uremia free.

In the days after 1955 when the first practical artificial kidneys were available, patients were given dialysis chiefly for hyperkalemia and usually when they had advanced uremic manifestations. As time passed, indications for dialysis changed so that now patients are treated relatively early when they have minimal symptoms and signs of uremia. Blood urea nitrogens are usually in the range of 100-150 mg/100 ml. In this fashion, patients may be kept in relatively good condition with decreased incidence of anemia, decreased tendency toward infection, and better wound healing.

The patient presented was treated with peritoneal dialysis by means of the indwelling cannula designed by Barry. This device is a flexible plastic tube with a balloon on one end. The balloon is surgically placed in the peritoneal cavity and pulled up against the peritoneal membrane just inside the abdominal wall. A doughnut-shaped disk is slipped down around the tubing to the skin and is held in place by a metal clip. *In situ,* the balloon inside and the disk outside prevent leakage. Since the balloon is also doughnut-shaped with a hole in the middle, the usual dialysis catheter may be introduced through the tubing into the peritoneal cavity. When dialysis is finished, the catheter is removed and replaced by an obturator. As in the presented patient, it is possible to perform frequent dialyses during the day and to let the patient sleep at night. In this way, a relatively uremia-free state may be maintained. There was, however, a complication sometimes associated with the device—infection around the cannula site and peritonitis. This was managed with antibiotics, and it was possible to continue the patient on the intermittent dialysis regimen. At the present time, the chief cause of death in acute renal failure is infection. It is unfortunate that devices such as these which can potentially introduce infection are necessary, but their role in obviation of advanced uremia is secure.

If the patient survives the oliguric phase, he will enter a diuretic phase which can be divided into early and late parts. From the point of view of management, renal function remains poor early and therapy is unchanged. Since concentrating ability is decreased, clinical and chemical deterioration can proceed until volume increases sufficiently. It usually requires between 1,500 and 2,500 ml of urinary volume daily before the blood urea nitrogen will begin to fall.

Once urinary volumes are above 2,500 ml, fluid and electrolyte losses may be a problem. It is helpful to measure urinary electrolyte concentrations in planning replacement. For example, if 5 L of urine are excreted containing 70 mEq/L of sodium and this is likewise replaced, the patient will retain a normal plasma sodium. If the patient is replaced with 5 L of fluid containing less sodium, then hyponatremia will ensue. If the patient is replaced with the appropriate amount of fluid but excess sodium, there will be hypernatremia. It is possible to cause dehydration or overhydration and to give deficient or excess electrolyte replacement during this time when excretion is relatively fixed. It is up to the physician to measure losses and to attempt to replace them precisely. Chronic renal disease may be considered in the same light, ie, as a prolonged diuretic phase. As the disease progresses, the kidneys' normal ability to vary output dependent upon intake is gradually lost and the physician must measure losses and be guided in replacement accordingly.

The patient presented was undoubtedly overhydrated during the oliguric phase and his diuresis was unusually large, amounting to 8½ L a day. In the past, patients excreted up to 12 L daily during the late diuretic phase, but today, with more enlightened fluid restriction guided by daily weights, most patients excrete less than 4 L a day.

The possible pulmonary infarctions in the illustrative case are an interesting phenomenon in acute renal failure. This has been described previously in many patients, but usually adequate documentation of pulmonary embolization is lacking. This patient may represent another example of the clinical picture of pulmonary infarction in this setting without the actual occurrence of such infarction.

In summary, most precipitating causes of acute tubular necrosis are associated with decreased glomerular filtration. Death from a precipitating cause, such as the accident this patient had, may occur in the first few days. It usually takes between five and ten days of oliguria before signs and symptoms of uremia and other complications—electrolyte imbalance and overhydration—appear. Management consists of attempts to maintain salt and water balance, usually by fluid restriction, diet, resins, and dialysis. In the diuretic phase, salt and water losses are a problem and these are again managed with appropriate salt and water prescription. The patient presented was young and healthy at the time of the accident and showed remarkable recuperative powers. These factors undoubtedly contributed to his recovery.

your medical faculty at work

by John Sargeant
Executive Director

The Executive Committee met on Thursday, May 7, 1970, and took the following actions:

1. Authorized its regular financial assistance to (a) the Maryland League for Nursing, and (b) the Student American Medical Association Chapter at The Johns Hopkins University School of Medicine;
2. Declined to grant legal defense to two physicians because of late payment of dues even though they had legitimate reasons. The Committee indicated it did not have the authority to supersede the Bylaws provision in this regard;
3. Approved the President's suggestion to appoint an ad hoc committee to investigate the MEDIC network. The Chairman of the Committee on Postgraduate Education, Preventive Medicine and Public Health would be asked to chair the committee, and its membership would be composed of proponents and opponents of the network, equally represented;
4. Authorized the Faculty office to mail out organ donation forms to potential donors upon their request;
5. Renominated Marcus W. Moore, MD, Baltimore, to serve another term on the Advisory Council on Hospital Construction;
6. Declined to submit a nominee for possible appointment to the Baltimore City Jail Board, since city officials did not request a nomination. The Committee indicated that it would be willing to make a nomination should the Mayor ask for such a recommendation;
7. Directed the Library Committee to continue to study the question of charging for Library-prepared bibliographies, as instructed by the Council in 1956 and 1963;
8. Authorized attendance of the Executive Director at a meeting on Peer Review Activities by Foundations for Medical Care;
9. Authorized appointment of Stanley M. Rosen, MD, Baltimore, to serve as Faculty representative on the Renal Disease Committee of the Regional Medical Program to succeed William G. Esmond, MD, Baltimore, whose term has expired. Dr. Esmond will continue to serve as Chairman of the Faculty's Ad Hoc Committee on Renal Dialysis and Transplantation;
10. Heard a recommendation from the Medical Economics Committee that the Faculty request Blue Shield to attempt to increase fee schedules in Blue Shield Plans A and B. It also heard that this was under consideration by Blue Shield and decided to request information on the current status of this proposal;
11. Accepted a report from the Medical Economics Committee regarding proposed arbitration, or fact-finding panels in connection with malpractice actions. The report is as follows:

Secretary of Health Proposal

This proposal is similar to programs that have been adopted throughout the country. Some have been successful, particularly those in small communities where there is a more personal relationship between the physicians and attorneys and where the patient is well-known by the entire community.

In larger areas, such as Philadelphia and New Jersey, they have not been successful. Legal counsel has indicated that this will not result in any diminution of malpractice actions but may well increase them.

There is no assurance that the patient will not seek the services of another attorney and institute suit, even if the panel agrees that no cause exists for such a suit. Data and information made available to the attorney for the plaintiff can also be used against the physician, which is undesirable especially in the adversary situation that exists today.

There is also some question as to whether the Professional Liability Insurers would agree to such arbitration, and the company now insuring physicians in Maryland, in a cooperative arrangement with the Faculty, might well agree to discontinue such arrangement. If this occurred it would make it extremely difficult for physicians to obtain coverage, inasmuch as many companies are declining to write this type of insurance.

The committee agreed to recommend that this proposal not be accepted as a desirable one because of the many problems involved, not the least of which is its questionable acceptance by the Bar Association and particularly the Plaintiff's Bar Association.

Legal Counsel Proposal

The committee then considered the proposal of Mr. John King, legal counsel, which would establish an arbitration panel composed of one physician selected by the patient and one selected by the attending physician. These two would select an attorney and if one could not be agreed on, the President of the State Bar Association would serve or designate an attorney to serve. This latter person would act as chairman.

The patient would have to sign an arbitration agreement prior to receiving medical care so as to make such arbitration binding under the law.

The committee agreed unanimously that this type of proposal should be rejected. Not only would it result in more cases, in their opinion, but it would destroy the confidence the patient has in his physician and it could lead to further deterioration of the traditional physician-patient relationship.

The committee was also of the opinion that this might be pursued for those "service" patients where no such physician-patient relationship existed. This should be discussed with the Hospital Council and the committee recommends that the Executive Committee pursue this.

Workmen's Compensation Type Proposal

This idea was suggested as an alternative to the above proposals. All physicians would pay into a common pool with premiums based on costs, etc. Set sums would be established as the cost of loss incurred in each situation and a commission would establish whether there was cause.

More details would have to be considered and it was proposed that this suggestion be pursued at the next committee meeting when representatives of the St. Paul Companies will be present.

The Council met on Tuesday, May 12, 1970, and took the following actions:

1. Received the report of the Policy and Planning Committee regarding recommendations contained in the Report of the AMA's Commitee on Long Range Planning:

Recommendation Number 1:

(a) That the AMA adopt the following as a statement of the primary purpose and responsibility of the Association and the medical profession:

> "To endeavor, by all appropriate means, to make health services of high quality available to all individuals, in a dignified and acceptable manner, regardless of their social class, ethnic origin, ability to pay for services, or the source of the payment."

(b) The adoption of the following as a corollary or, rewritten, as a separate policy statement:

> "The American Medical Association has the duty to guide and assist the medical profession in the attainment of this objective."

Recommendation Number 2:

That, while the AMA must be prepared to accept some circumscription of the traditional privileges and freedoms of physicians, the following policy be adopted:

> "That the American Medical Association recognize the need for new and improved methods of delivering health services, that it encourage and participate in efforts to develop them, and
>
> "That, in the interest of attracting the most highly qualified candidates to the field of medicine, it simultaneously make every effort to maintain and create incentives in medical practice. Among these incentives are maximum professional independence, a multiplicity of practice options, and freedom of choice for both physicians and patients."

Recommendation Number 3:

That the AMA officially adopt the following definition of health:

> "Health is a state of complete physical and mental well-being and not merely the absence of disease or infirmity."

Recommendation Number 4:

The Policy and Planning Committee offers the following substitute recommendation which the Faculty's Delegates to the AMA House should support in lieu of the recommendation of the AMA Committee:

> That AMA adopt an active role and take the initiative in developing plans and programs for the medical aspects of health care; that the AMA show a continuing interest and cooperate actively in the nonmedical components of health services; and that it encourage and assist state and county medical societies to do the same at their respective levels.

(Continued next page)

Recommendation Number 5:

(a) That an appropriate committee or division of the Association secure data from all the state medical societies on the adequacy of health services and the manner in which they are being provided in their rural and underprivileged areas, and the practice mechanisms, if any, that are being considered or developed to correct existing deficiencies. Based on this information, the same committee should devise delivery systems consonant with the Association's principles and incentives for physicians to settle in medically deprived localities.

(b) That the Association, in conjunction with state and county medical societies, establish a service of consultation and assistance for such physicians to facilitate the planning and financing of their projects.

(c) That, in those instances in which physicians cannot be found to develop health care facilities with the capability of providing needed services, the AMA urge, encourage, and assist the state and local medical societies to do so on an operational basis.

(d) That the Association *study the possibility of establishing a corporation for this purpose, with subsidiary corporations at state and local levels. All such corporations should be legally empowered to receive payments for services rendered and would apply surplus income over expenditures to activities designed to improve health care in their areas, both quantitatively and qualitatively.

(e) That the AMA and the constituent and component medical societies seek the active involvement of medical centers and voluntary hospitals in health service projects for the medically underprivileged.

* This word "study" is extremely important, inasmuch as the long-standing policy of the AMA and the profession has been one of opposition to the Corporate Practice of Medicine.

The Policy and Planning Committee felt it important that emphasis be placed on the word study. With this cautionary comment, the committee recommends support of this recommendation by the Faculty's Delegates to the AMA.

Recommendation Number 6:

(a) That the AMA, through its Council on Health Manpower, in conjunction with other professional, educational, and lay associations, continue to explore and develop expedients to overcome health manpower shortages.

(b) That the Association, in its future declarations and activities directed toward the alleviation of shortages in health services and personnel, underscore the fact that these shortages are *not* due merely to an insufficient number of health professionals across-the-board, and emphasize that maldistribution of practitioners geographically, by profession, and by specialty is an equally important factor in depriving communities of an adequate supply and spectrum of health services.

(c) That the Association publicize the reasons for the maldistribution, as outlined in this section and amplified in Dr. Budd's minority report and stress that the *voluntary* correction of these deficiencies requires public cooperation and community action in addition to the measures taken by the health professions.

Recommendation Number 7:

(a) That an appropriate committee of the AMA immediately begin to formulate a policy on physicians' assistants, particularly with regard to their responsibilities, limitations on their practice, and supervision of their services by qualified physicians.

(b) That the AMA reaffirm the principle that the basic responsibility for the care and welfare of patients lies with their physicians of record and that that responsibility cannot and should not be delegated.

(c) That the Association's Law Division assist the state medical societies in identifying and avoiding any legal hazards that may accompany the employment of physicians' assistants.

Recommendation Number 8:

(a) That an appropriate committee of the AMA be charged with the task of establishing the basic criteria which any proposed system of delivery of health services or mechanism for payment must satisfy to be acceptable.

(b) That the Association, in all public statements, emphasize the concept that local conditions may necessitate different systems of delivering medical care for different population groups.

(c) That the state and local medical societies be encouraged and assisted in devising and proposing practice expedients suited to their localities and their problems.

(d) That the Association, in conjunction with the state and county medical societies, establish a consultation and assistance service for physicians or groups of physicians who wish to develop organizations or programs for the rendering of health services.

(e) That the AMA endeavor to be informed of the pilot projects that are proposed by other sources and that it request the department of HEW to discuss those projects with the Association before they are put into effect.

(f) That the Association seek to ensure that the value judgments made by the Department of HEW on plans, programs, pilot projects and payment mechanisms are firmly based on the criteria and standards the AMA has developed for that purpose.

Recommendation Number 9:

(a) Urge state medical associations to undertake various studies, including surveys of medical care costs.

(b) Develop a uniform methodology for conducting such studies to the end that the data from the various states and localities be comparable.

(c) Serve as a clearing house for the material thus obtained and, after analysis, redistribute the data to the state medical associations with suggestions and conclusions.

(d) Urge the state medical associations to designate negotiators who are qualified to deal energetically with government agencies on all matters pertaining to tax-supported programs. Such individuals or groups should be formally appointed and the government jurisdiction involved should be notified that all negotiations will be conducted by them.

Recommendation Number 10:

(a) That the AMA urge state and county medical societies to assume the functions of monitoring fees and containing the costs of health care.

(b) That the Association, in cooperation with the constituent societies, determine what powers the state and local societies require to serve these functions and how those powers can be best obtained.

Recommendation Number 11:

(a) Endorse the principle of voluntary, life-long postgraduate study for all physicians and continue and accelerate the development of programs and incentives for such study.

(b) Through the state medical societies, investigate the current status of in-hospital audit methods and make a similar investigation of the state of development of the evaluation of office services.

(c) Encourage and assist the state medical societies and state departments of health and welfare to develop uniform and effective method of audit for both office and in-hospital services, based on electronic data processing, to the maximum possible extent.

(d) Request the Law Division to clarify the extent to which a physician's responsibility for the privacy of his patients' records will permit him to cooperate in an audit of his office practice.

Recommendation Number 12:

(a) That the AMA encourage and assist all state medical associations to devise programs for voluntary postgraduate study designed to maintain medical education at an optimum level and to be least disruptive to the provision of medical services.

(b) That the Association obtain information from each state medical society as to whether special requirements have been imposed on physicians who render services to patients under the provisions of tax-supported programs and obtain the specifics of what those requirements are.

(c) That in those states where the health or welfare departments have imposed special requirements on physicians to participate in their programs, the medical society reject those requirements and that, if the need for such regulation can be demonstrated, the state medical society, education department, and health department cooperatively develop standards to be incorporated into the education law and enforced on all physicians of that state, thereby eliminating double standards for medical practice and restoring the licensing authority to the proper agency.

Recommendation Number 13:

(a) That the Association secure data from state and county medical societies on problems in physician-hospital relationships in their areas and the measures, if any, that are being taken to solve them.

(b) That, on the basis of these data, the Association identify the basic principles that apply to staff-hospital relationships and encourage state and county medical societies to do the same.

(c) That the Association and each state and county medical society request its counterpart in the hospital association structure to assist in developing guidelines and urge their member associations and hospitals to implement them.

Recommendation Number 14:

(a) That the Association, through its current liaison with the NABSP, seek to obtain continuous and current information on the Medicare Program; that it secure data on the development of additional benefits, new fields of coverage, and minimum standards of benefits in voluntary plans; and that, through the NABSP, it stimulate the Blue Shield Plans to greater efforts in upgrading their programs.

(b) That a similar liaison committee be developed in conjunction with the Blue Cross National Association for similar purposes.

(c) That the AMA advise state and county medical societies to take similar action at their respective levels and to review their representation on the boards of directors of their local Blue Plans to be sure that their representatives are individuals who are currently active in society affairs and familiar with society policy.

(Continued next page)

(d) That the Association seek a formal and direct channel of communication with the Department of Health, Education and Welfare, with the object of developing its own capacity for modifying existing and new programs when such modification is indicated, rather than relying solely on the NABSP for this purpose.

Recommendation Number 15:

(a) An appropriate committee or division of the Association gather information from the state medical societies on the availability of physicians, ancillary personnel, hospital beds in all categories, laboratories, public health nurses, social service workers, and all other types of health professionals.

(b) The Association promulgate a "Health Bill of Rights" to identify the services that comprise comprehensive health care.

(c) On the basis of the data obtained from the state medical societies, the Association establish minimum standards for health care and a system of priorities for the provision of services beyond those minima, thus creating both an immediate and a long range schedule for their attainment.

(d) The Bill of Rights, the data and the standards and priorities receive wide publicity.

Recommendation Number 16:

(a) That the Association request the state medical societies to submit information on the status of comprehensive areawide planning in their states and the problems that are being encountered.

(b) That this information be analyzed, summarized, and redistributed to the state societies, together with the suggestions made in the preceding paragraphs and a resume, prepared by the Law Division, of the provisions in the law that are pertinent to those suggestions.

(c) That the implementation of comprehensive areawide health planning be reviewed periodically and that the state and county medical societies be advised of the problems and pitfalls in this difficult but important area of endeavor.

Recommendation Number 17:

That the present structure of the association be retained and that it be strengthened by improvements and modifications in its function.

Recommendation Number 18:

(a) That an immediate survey be conducted of the state medical societies and, through them, of the component county medical societies to determine what arrangements they have made, if any, for the regular collection of data on the socioeconomics of health care.

(b) That, on the basis of the information received, the AMA develop tables of organization for research divisions at the state levels and methods of participation for county societies that are in keeping with their resources. The planning should be developed along lines that are compatible with the concept of a tight federation of societies and are least disruptive to research divisions that are already in existence.

(c) That the association hold a series of working meetings with state and county medical society executives, individually or in groups, to further refine the organizational patterns and procedures that will best serve them in this collective endeavor.

Recommendation Number 19:

That on implementation of the program for organization and reorganization, a planning council with appropriate subcommittees be formed for the purpose of processing data and formulating policy recommendations for the consideration of the Board of Trustees and the House of Delegates.

Recommendation Number 20:

That the AMA sponsor, promote the formation of, and participate in, a "National Academy of the Health Professions for Research and Policy."

2. Decided that the June 1970 Council meeting should be held in the Faculty building;

3. Briefly discussed the Abortion Repeal bill and decided on no further action.

The Executive Committee met on Thursday, May 28, 1970, and took the following actions:

1. Heard that the Court of Appeals Committee on Rules and Practices and Procedures of the Court had declined to establish a rule requiring posting a bond of $500 by plaintiffs in malpractice suits;

2. Heard that the Court of Appeals has denied a writ of certiorari in the case of Conley vs State of Maryland. The Faculty had filed an Amicus Curiae brief which involved the conviction of an addict on the basis of information provided a physician during treatment. The conviction was for "possession of heroin" based on evidence of ingestion. Legislation has since been enacted and signed into law by the Governor which prohibits use of such data in civil or criminal proceedings;

3. Discussed "areas of mutual concern" with AFL/CIO representatives, and agreed to recommend that the President be empowered by the Council to appoint an ad hoc committee to act as liaison with a similar group from the union;

4. Declined to file an Amicus Curiae brief in a court case to test the constitutionality of the current abortion statutes;

5. Determined not to reprint the Annual Reports being published in the June issue of the *Maryland State Medical Journal,* thus saving about $400. All delegates, alternates, and component officers will be advised to retain this issue of the Journal and take it with them to the Semiannual Session in Hershey on September 11, 1970;

6. Authorized attendance of a Faculty representative at the AMA-sponsored National Congress on Health Manpower in Chicago on October 22-24, 1970;

7. Authorized the Program and Arrangements Committee to change the Annual Meeting dates for 1971 to coincide with available dates of suitable facilities;

8. Authorized appointment of a Faculty representative to the Hearing and Vision Early Screening Board;

9. Authorized sponsorship of a Symposium on Emergency Room Care in cooperation with the Emergency Room Physicians organization;

10. Rereferred to the Council a proposed participation agreement that the State Department of Health is planning to require all providers of services to Medicaid patients to sign.

Luis Miguel Cuza, MD, of North East, and **Joseph G. Lanzi, MD,** of Elkton, have been reelected to active membership in the American Academy of General Practice.

Reelection signifies that the physician has successfully completed 150 hours of accredited postgraduate medical study in the last three years. Members become eligible for reelection at the end of the third year following their election to membership.

A film highlighting the early detection of hearing disorders and prompt treatment to prevent further hearing loss, "Deafness in Children", is now available from the State Department of Health and Mental Hygiene.

Filmed at The Johns Hopkins Hearing and Speech Center, the 25-minute film follows a diagnostic study of Barry, a two-year-old with speech and hearing problems.

Suggested for parent education groups and for general audiences from high school through adult level, the film may be borrowed without charge from the Film Services, Maryland State Department of Health and Mental Hygiene, 301 West Preston Street, Baltimore, phone 383-3010, extension 8516. Time should be allowed to preview the film and to arrange for a discussion leader.

Increasingly stringent federal regulations on motor vehicle emissions will be imposed in accordance with a timetable announced by the Department of Health, Education and Welfare.

Beginning with the 1975 model year, proposed new standards will sharply lower the limits on exhaust emissions of carbon monoxide and hydrocarbons from the levels in effect on 1970 models. In addition, the new standards will set limits for the first time on exhaust emissions of nitrogen oxides, to begin with the 1973 model cars, and will set limits for the first time on exhaust emissions of particulates, beginning with the 1975 model year.

Wisconsin has banned the sale and use of DDT for any purpose other than control of epidemic diseases affecting humans, plants, or animals which are spread by insects and which cannot be effectively controlled by other pesticides. Special state board approval is needed for any use of DDT.

* * *

Air Quality criteria for carbon monoxide, photochemical oxidant, and hydrocarbons have been issued by the National Air Pollution Control Administration, together with reports on recommended control techniques for the sources of these pollutants. Résumés of the criteria may be obtained from NAPCA, 5600 Fishers Lane, Rockville, Md., 20852.

Under the provisions of the Air Quality Act, states must hold hearings on standards for these pollutants and then adopt plans for implementation and enforcement.

A marked increase in syphilis cases in the United States was reported by the National Communicable Disease Center for the first four months of this year.

The infectious disease jumped as much as 50% or more in some areas while the nation as a whole experienced an increase to 6,861 cases from 6,203 for the same four-month period last year. One of the biggest increases was noted in New York city where 1,241 cases were reported as compared with 863 for the same period last year.

JEAN R. STIFLER, MD, ACTING COMMISSIONER

Maryland State department of health

Maryland's Poison Information Center

During 1969, 5,630 cases of poison ingestion were recorded by the Maryland Poison Information Center, a project of the State Health Department at Baltimore City Hospitals.

Approximately 3,000 of these cases were reported directly to the center, and the others were reported through poison control centers at eight Maryland hospitals: Johns Hopkins, Sinai, and University of Maryland hospitals in Baltimore city; Sacred Heart Hospital in Allegany County; Holy Cross and Suburban hospitals in Montgomery County; Memorial Hospital in Talbot County; and Washington County Hospital.

Although there is an increase over the 1968 total of 5,141, it does not necessarily mean that more people suffered from poisoning. Mary S. Furth, MD, director of the center, believes that the higher figure for 1969 may reflect an increase in reporting as the center's services have become more widely known.

Medicines were ingested more frequently than any other potentially poisonous product during the past year. There were 380 poisonings from aspirin, 198 from tranquilizers and barbiturates, 630 from other internal medicines, and 173 from external medicines.

Pesticides and miscellaneous household products accounted for 723 of the poisoning cases recorded.

In 110 cases, suicide was attempted; 72 were poisonings with undetermined intent; and 2,104 were known to be accidental.

Young children suffered the largest number of poisonings—1,570 in the one to four age group, and 101 in the five to eleven age bracket. Eighty-nine of the children in the one to four group were repeaters, and 8% of those in the pediatric age group had suffered from poison ingestion more than once. It is predictable that such children will experience more ingestions within the next six months to one year, and there appears to be a need for evaluation of the parent-child relationship in such cases in order to give parents the necessary support and assistance in developing environmental safeguards.

Among persons 12 years and older, there was an 80% increase over 1968 in all kinds of internal medicines poisonously ingested. Tranquilizers showed a 40% menace, aspirin 9%, and miscellaneous medicines 31%.

These ingestions are considered self-poisonings and generally are not accidental; many of them were classified as suicide attempts. Sixty-two percent of those among patients 12 years and older were of a questionable nature and were not assumed to be accidental. Usually persons in this age group ingest toxic amounts and require hospitalization.

In the counties of Maryland, deaths from poison ingestion totaled 81 during 1969.* Of these, 66 were classified as suicides, and 15 as accidental deaths. Except for two children under two years of age, all of the deaths were among persons above 16 years.

There were 100 poisoning deaths reported in Baltimore city.** Fifty-eight were attributed to narcotics, 37 to drugs, and the others to miscellaneous substances. Twenty-six of the deaths in the city were suicides.

Barbiturate poisoning caused 23% of the deaths from poisoning in Baltimore city, and 33% of those in the counties.

Ingestion of poisonous amounts of medicine constitutes a severe threat to life, especially in the case of the barbiturates. Use of these for deliberate self-poisoning, in some cases resulting in death, warrants medical reevaluation of the need to prescribe them so frequently. Also, there is a need for psychiatric evaluation and support of patients in order to curb abuse of these medications.

** Statistics do not include narcotic deaths.*

*** Statistics do not include carbon monoxide deaths.*

Information accumulated by the Maryland Poison Information Center is useful in providing some idea of the scope and type of poisonings which are occurring in the state, and has proven to be of practical value in educational and preventive efforts. It is important to note, however, that these statistics cannot be regarded as representative of the total problem in the state, since many areas are not reporting poison incidences to the center.

The Poison Information Center is in operation 24 hours daily, seven days a week. Dr. Furth and her staff give instructions for emergency first aid in poisoning cases until medical assistance is available. No treatment is given at the center, but emergency cases are referred to hospitals for care. In 1969, 457 individuals were referred to Baltimore City Hospitals.

Any physician in the state may request information on toxic products and their antidotes.*** Telephone requests for information during 1969 included 592 from physicians and other medical personnel, and 2,091 from nonmedical sources.

The center conducts follow-up on certain poisoning incidences, and also conducts educational efforts for health professionals, parents, and various organizations.

Smallpox Vaccination Complications, Maryland, 1968

During 1968, the Division of Communicable Diseases of the Maryland State Health Department, in conjunction with members of the Department of Pediatrics of The Johns Hopkins Hospital and the Smallpox Eradication Program of the National Communicable Disease Center, conducted a semiprospective study to determine the number and types of complications associated with smallpox vaccination in Maryland. Seventy-eight percent of 3,800 Maryland physicians returned a mailed questionnaire requesting reports of vaccination complications. A total of 105 patients with complications following smallpox vaccination were reported.

The most frequent complications were accidental infections (25 cases), and erythema maltiforme reactions (27 cases). Other commonly noted complications were severe local reactions (20 cases), generalized vaccinia (16 cases), and eczema vaccinatum (9 cases). Eighty-one of the patients were primary vaccinees, eleven were revaccinees, and six were contacts of recent vaccinees. The majority of the patients were primary vaccinees in the one to four years age range. There were no deaths reported, and although most complications were mild, 17 patients did require hospitalization.

Precise data on the number of smallpox vaccinations performed in Maryland during 1968 are not available. However, proportional figures for Maryland can be derived from the United States Immunization Survey 1967-1968 (page 24, DHEW, PHS, Health Services and Mental Health Administration, National Communicable Disease Center, Atlanta, Georgia, December, 1968). Using these data, the approximate rates of complications were 1 out of 1,000 primary vaccinations and 1 out of 15,000 revaccinations.

1. The optimal time for primary smallpox vaccination is between the first and second birthdays.

2. Individuals with eczema and other forms of chronic dermatitis in any stage of activity should not be vaccinated and should not be exposed to recently vaccinated individuals. Persons with poison ivy, impetigo, or other more acute skin lesions should not be vaccinated until the skin has healed. Persons who might expose household contacts with eczema or other chronic dermatologic illnesses should not be vaccinated unless adequate separation between the vaccinee and his contact can be maintained until the scab falls off.

3. Pregnant women should not be vaccinated.

4. Persons with leukemia, lymphoma, blood dyscrasias and other altered immunologic states or on immunosuppressive therapy such as steroids, antimetabolites, and ionizing radiation should not be vaccinated.

If vaccination is essential in the above individuals because of potential exposure, or recent exposure, to smallpox, or if one of the above individuals has been vaccinated through error, expert consultation should be sought.

For a more detailed review see *The Johns Hopkins Medical Journal*, **126:** No. 3, March, 1970, page 160.

Metabolic Changes Associated with the Cessation of Cigarette Smoking

Two-part study of seven volunteers, first while still smoking and again a month after they had stopped, revealed metabolic changes which partially accounted for undesirable weight gained by six participants.

Much effort has gone into convincing cigarette smokers that they should stop smoking since cessation has been shown to reverse some adverse effects due to smoking. Frequently, however, persons who stop smoking gain weight in the succeeding weeks. This undesirable weight gain is often attributed to increased eating due to some sort of psychological compensatory reaction. However, the cause is actually unknown. The present study of seven volunteer smoking scientists was undertaken to determine if the cessation of smoking was associated with any gross metabolic changes that could account, in part at least, for weight gain.

Each subject underwent two batteries of tests, the first one while still smoking and the other after he had stopped smoking for a month. Both test series included a thorough physical examination, blood chemistry analysis, and pulmonary function tests.

For the first test the volunteers abstained from smoking, as well as eating and drinking, for at least 12 hours. The whole test procedure was administered in the supine position after a brief half-hour rest period.

Respiration rates were recorded during the initial phase of the examination while inspired and expired samples were collected for gas analysis and gas volume determinations. Temperature and blood pressure were taken by routine methods, as was a six-lead electrocardiogram using the limb leads.

Venous blood samples were collected in tubes without anticoagulant for serum cholesterol, calcium, and protein-bound iodine (PBI) determinations. Anticoagulated blood samples from the fasting participants were also used for blood glucose, hemoglobin, and hematocrit measurements. Then each volunteer was given 150 ml of a 50% glucose solution in ice. Another venous blood sample was drawn for a postprandial glucose determination a half hour later. Finally, subjects were permitted to stand for height and weight measurements.

Blood glucose determinations were derived from the ferricyanide reduction method adapted for the autoanalyzer; PBI analysis from the wet ash and ceric ammonium sulfate-arsenous acid method, also adapted for the autoanalyzer. Cholesterols were derived from the Pauvionsky method.

Hemoglobin concentration was determined spectrophotometrically, using Drabkin's reagent. The hematocrit was read in microcapillary tubes. Serum calcium levels were determined by atomic absorption spectroscopy.

Analysis of data was made in paired comparison, with each subject serving as his own control.

Histories revealed that the seven participants had smoked an average of 12.7 years and consumed an average of 1.4 packages of cigarettes daily. Only two had developed a chronic cough.

Average age for the seven was 31.4 years: the average height, 178.7 cm (70.21 inches).

Change Between Test Periods

Significant changes had occurred between the two test periods. The average weight rose from 83.29 kg (188.3 lb) to 87.33 kg (194.7 lb). The average body surface area, as measured against the nomogram of DuBois, rose from 2.03 meters squared to 2.05 meters squared. This increase was due to the increase in body weight.

The average blood pressure rose 113/73 mm Hg to 117/73; the average heart rate on ECG dropped

Stanley C. Glauser, MD, PhD, Elinor M. Glauser, MD, Marcus M. Reidenberg, MD, Ben F. Rusy, MD, and Ronald J. Tallarda, PhD, *Archives of Environmental Health* (Vol. 20) March 1970.

from 60 beats to 57 beats per minute. The hematocrit remained constant (44.2 per 100 ml); so did blood glucose of fasting participants at an average of 87 mg/100 ml. However, the average 30-minute postprandial blood glucose level dropped from an average of 137 mg/100 ml before to 123 mg/100 ml after they quit smoking. The PBI dropped from 5.1 μg/100 ml to 4.6 μg/100 ml. The average hemoglobin rose from 13.3 gm/100 ml to 14.0 gm/100 ml, while the serum calcium dropped from 10.2 mg/100 ml to 9.7 mg/100 ml.

The average oxygen consumption dropped from 283 ml/min to 260 ml/min. The average carbon dioxide production dropped from 213 ml/min to 210 ml/min.

The respiratory quotient was calculated for each individual by dividing carbon dioxide production by oxygen consumption. The average respiratory quotient rose from 0.75 to 0.81. The average respiratory rate rose from nine breaths per minute to ten breaths per minute. Electrocardiographic patterns remained constant. Temperature remained constant at an average of 36.4°C (97.6°F).

Six of the seven volunteers gained weight during the month between tests. The seventh, who maintained his weight, reported a marked increase in activity.

Some of the other significant changes from the first test period to the second were the increases in body surface area and respiratory quotient, and decreases in PBI and serum calcium levels.

Especially significant was the decreased hyperglycemic response of the participants to a glucose meal after cessation of smoking while the blood glucose level, when they were still fasting, remained constant. The decreased heart rate was small, but statistically significant.

Metabolic Change

All these changes suggest a metabolic change. Such a change could cause a decreased basal oxygen consumption. Such a decrease was noted in six of the seven participants in the present study. With no change in caloric intake or physical activity, this metabolic change would cause a weight gain.

Other known changes produced by smoking include an increased heart rate, blockage of normal metabolism of tryptophan, induction of benzpyrene hydroxylase in placental tissue, and decrease in carbonic anhydrase in fetuses. Nicotine has been shown to cause an increase in tryptophan pyrrolase, and in the rate of metabolism of ethylmorphine, norcodeine, and aniline.

The metabolic changes following the cessation of smoking, described in this study, may be one of the reasons for the weight gain observed. The authors suggest that weight gain may not be due solely to increased caloric intake without parallel physical activity, as is generally thought.

SKIN PROBLEMS

Caused by itching due to:

Dry Eczema	Acne
Chafing	Ivy Poisoning
Minor Burns	Cold Sores
Athlete's Foot	Heat Rash
Dry Skin	Diaper Rash
Wind Burn	Chapping
Insect Stings	Hemorrhoids

For Safe, Sure, Speedy Relief —
— Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, Resinol Greaseless Cream was developed. . . . A doctor's formula containing safe yet powerful ingredients, Resinol Greaseless contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try Resinol Greaseless . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

POLYMYXIN B-BACITRACIN-NEOMYCIN OINTMENT

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

Clinical Extension of a pure Smooth Muscle Relaxant

TROCINATE®

Brand THIPHENAMIL HCl

400 mg./100 mg. S/C tablets

Trocinate relaxes all smooth muscles. Its direct action (musculotropic) does not involve the autonomic nervous system and it is not mydriatic. It is metabolized by the body and eliminated in the urine as harmless degradation products. Trocinate has a remarkable history of freedom from side-effects.

When a pure direct-acting smooth muscle relaxant is indicated, Trocinate is the drug of choice.

DIARRHEA (functional) . . . *the first 400 mg. tablet usually relieves the discomfort of diarrhea so promptly that it ceases to be a bother.*

DIVERTICULITIS—MUCOUS COLITIS . . . *the accompanying discomforts can be relieved by this direct smooth muscle relaxant.*

BLADDER SPASM . . . *relaxation is immediate. One or two tablets condition the bladder for cystoscopy in one hour.*

SPASTIC URETER . . . *the specific relaxing effect of Trocinate on the spastic ureter has been proven by animal studies and affirmed clinically. (J. Urol. 73:487-93)*

PRESCRIBING INFORMATION

WARNING: Do not give in advanced kidney or liver disease. PRECAUTIONS: Trocinate relaxes all smooth muscles. Large dosage or prolonged usage may cause feeling of weakness or can theoretically precipitate gall-bladder colic, due to relaxing the vascular and duct systems. Caution should be observed in patients with urinary bladder obstruction. DOSAGE: 400 mg. May be repeated in 4 hours. After relief, lengthen the dose frequency. (see side note)

NOTE: *The high therapeutic index of Trocinate permits its administration in dosage sufficient to relieve smooth muscle spasm promptly. 400 mg. dosage usually creates a therapeutic blood level. In reducing dosage after relief, lengthening the time between dosage rather than lessening the recommended dose is preferable. The prompt direct action allows a conclusiveness of the first suggestion of relief of symptom . . . a guide to dose control and to determining when treatment is complete. A prescription for twelve or sixteen 400 mg. tablets will usually correct spasm and leave a few tablets for a reserve.*

CAUTION:

OVEREATING MAY BE HAZARDOUS TO YOUR HEALTH.

According to the Framingham Heart Study, the obese face:

86% greater risk of angina pectoris,
82% greater risk of diabetes,
71% greater risk of coronary heart disease.*

Obesity may also aggravate osteoarthritis, flat feet, intertriginous dermatitis, varicose veins, and ventral or diaphragmatic hernias.[1-3]

you are considering weight reduction, consider

Preludin®
phenmetrazine hydrochloride
Endurets®
prolonged-action tablets

Often effective

Controlled studies in a general patient population have shown that when Preludin is used with diet, the rate of weight loss exceeds that obtained by placebo and diet.

Long acting

Slow, even release of the active principle usually suppresses appetite continuously for about 12 hours.

Once-a-day dosage

One Endurets tablet after breakfast. It helps reduce weight and costs, conveniently.

For contraindications, warning, precautions, and adverse reactions, please see the full prescribing information.
It is summarized on this page.

Where there's no will there's a therapeutic way.

*Among persons 20% or more overweight as compared with median weight for persons of like height and sex.

1. Kannel, W.B., *et al.*: *Circulation* 35:734, 1967.
2. Thomas, H.E., Jr., *et al.*: *Med. Times* 95:1099, 1967.
3. Albrink, M.J., in: Beeson, P.B. & McDermott, W. (eds.): *Cecil-Loeb Textbook of Medicine*, ed. 12, Phila.: W.B. Saunders Co., 1967.

Preludin®
phenmetrazine hydrochloride

Preludin is indicated only as an anorexigenic agent in the treatment of obesity. It may be used in simple obesity and in obesity complicated by diabetes, moderate hypertension (see Precautions), or pregnancy (see Warning).

Contraindications: Severe coronary artery disease, hyperthyroidism, severe hypertension, nervous instability, and agitated prepsychotic states. Do not use with other CNS stimulants, including MAO inhibitors.

Warning: Do not use during the first trimester of pregnancy unless potential benefits outweigh possible risks. There have been clinical reports of congenital malformation, but causal relationship has not been proved. Animal teratogenic studies have been inconclusive.

Precautions: Use with caution in moderate hypertension and cardiac decompensation. Cases involving abuse of or dependence on phenmetrazine hydrochloride have been reported. In general, these cases were characterized by excessive consumption of the drug for its central stimulant effect, and have resulted in a psychotic illness manifested by restlessness, mood or behavior changes, hallucinations or delusions. Do not exceed recommended dosage.

Adverse Reactions: Dryness or unpleasant taste in the mouth, urticaria, overstimulation, insomnia, urinary frequency or nocturia, dizziness, nausea, or headache.

Dosage: One 25 mg. tablet b.i.d. or t.i.d. Or one 75 mg. Endurets tablet a day, taken by mid-morning.

Availability: Pink, square, scored tablets of 25 mg. for b.i.d. or t.i.d. administration, in bottles of 100 and 1000.

Pink, round Endurets® prolonged-action tablets of 75 mg. for once-a-day administration, in bottles of 100 and 1000.

Achrocidin® Tablets and Syrup

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen Citrate 25 mg.

ACHROCIDIN Tetracycline HCl—Antihistamine—Analgesic Compound Tablets and Syrup are recommended for the treatment of tetracycline-sensitive bacterial infection which may complicate vasomotor rhinitis, sinusitis and other allergic diseases of the upper respiratory tract, and for the concomitant symptomatic relief of headache and nasal congestion. For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN Tetracycline equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Baltimore City
health department

Nutritional Status of Baltimore City School Children And School Food Program

Within the past two years there has been much public concern over the general nutritional status of school children in the United States. Much of this interest has been generated by cooperative studies conducted in Baltimore city by the Baltimore City Health Department and the Baltimore City Department of Education.

The first of such studies, "Appraising The Health Of Culturally Deprived Children", was conducted from 1963 to 1965 and was published in the October 1967 issue of *The American Journal of Clinical Nutrition*. This was a health evaluation of children enrolled in the city's Early School Admissions program established in 1962 by the Department of Education for pre-kindergarten youngsters of low-income families. The Early School Admissions program was the forerunner of the national Head Start program in Baltimore.

A second study, in 1968, by the City Health Department of a sample of children (2,000) receiving services in the City Health Department's four Comprehensive Children and Youth Health Centers, revealed that many preschool and school-age youngsters were nutritionally deprived to the point of retardation of normal physical growth. These findings prompted the Health Department to urge the Mayor to establish a Task Force on Nutrition to study the problem in Baltimore and to implement programs based on its results. Under Health Department guidance, the Task Force was in operation early in 1969. Its membership contained representatives from every interested and involved governmental agency in the area including the local health department, departments of education and social services, and volunteer groups.

A third study, the most extensive nutrition study-project conducted in Baltimore, was one of several programs implemented upon recommendation of the Task Force. This was a nutritional-status survey of 59,000 school children in the first, second, and third grades of all city public elementary schools. It was this study that was chiefly instrumental in increasing the number of free school lunches in Baltimore city from 1,100 in 1968 to 30,000 by the end of 1969.

The Baltimore nutritional-status survey was conducted in May 1969 not only to establish the extent of malnutrition of children in the primary grades, but also to identify signs of undernutrition to serve as guidelines for principals in determining which children should receive free school lunches.

Accurate assessments of the nutritional needs in large populations have never been easy and always require the exercise of considerable judgment. Five points of investigation have been used in conducting such studies. These are: (1) clinical examinations, (2) biochemical and other laboratory investigations, (3) vital statistics studies, (4) anthropometric data studies, and (5) dietary surveys. In the Baltimore study, in view of limitations of time and staff, it was decided to study three factors—height, weight, and the microhematocrit or blood test for anemia. Ten teams of ten persons each, including physicians, laboratory technicians, public health nurses and health aides, were organized. All technicians were provided through the cooperation of local hospitals. All others were provided by the Department of Health.

Results of the survey are still under study. Preliminary evaluation has shown that of 21,617 children blood tested for anemia, a total of 8,792 had microhematocrits of 36 and below, a level which indicates nutritional anemia. In addition, 541 of these children had readings of 30 or below—a condition of undernutrition severe enough to warrant closer medical attention and treatment. All in the latter group were referred to local hospitals for further evaluation and follow-up. Extending these figures to the total elementary-school population, it

was estimated that some 50,000 children in grades one through eight were not receiving adequate nourishment at home and should be eligible for free meals through school programs. As mentioned previously, 30,000 of these children are now participating in the school lunch program. In addition, as of October 1969, some 2,600 children were enrolled in the free school-breakfast program.

With the preliminary results of the nutrition study in hand, the Mayor's Task Force was able to prompt the city government to increase its appropriation for free and reduced-cost lunches from $100,000 to $553,000. A "hunger banquet" held by the Maryland Food Committee, Inc., a group of interested private citizens, raised additional monies for the school lunch program. Furthermore, additional funds were obtained to establish school food service centers to supply free and reduced-cost meals to 63 schools where no food was available before. This total is slightly less than half the total number of 150 elementary schools in the city.

Baltimore city has made a good start in improving the nutritional status of its school children. Hopefully, these and continuing efforts will contribute immeasurely to the future mental and physical health of its citizens.

rehabilitation notes

Renal Involvement in Spinal Cord Injuries

The Geigy Pharmaceuticals Company has published an excellent summary of present knowledge and management of spinal cord injuries. It is largely the work of Dr. Alain Rossier, a paraplegic, and represents the experience in the rehabilitation of paraplegics in Switzerland in the last 15 years. It is concerned primarily with bladder reeducation, bowel reeducation, and reeducation of the locomotor system. This is a well-printed, well-illustrated pamphlet of about 100 pages with a minimal amount of drug advertising. The approach is conservative. The work of Kessler, Guttmann, Bors, Bunts, Commar, Munro, Talbot, and many other authorities on spinal cord injury are quoted throughout.

The author estimates that 40% to 60% of paraplegics are able to dispense with a portable urinal. Some authorities estimate that as high as 78% of patients achieve satisfactory bladder control. One must accept these results with a great deal of skepticism. It may be that as many as 78% achieve satisfactory bladder control for a short period sometime during their hospitalization or thereafter, but it seems quite unlikely that 78% of the patients can maintain satisfactory bladder control for any prolonged period of time. This statement also brings up the meaning of "satisfactory". There is general agreement that the prognosis in paraplegia *quo ad vitam* lies in the patient's kidneys. In one series, made up mainly of children with congenital paraplegia, all deaths were attributed to chronic pyelonephritis. Another series from three Canadian clinics recorded 50% of deaths were due to genitourinary infections. From the United States Veterans Administration, 27 of 59 deaths, in 1960 and 1961, were due to kidney disease. In England, Guttmann reported that 20 of 26 patients whose deaths were due to spinal injuries, died of renal failure. Thus, present methods of bladder care in spinal cord injuries are unsuccessful in preventing late renal complications.

A second problem is the breakdown of the skin, which is almost universal in paraplegics treated in general hospitals. It is difficult to find figures as to how many patients admitted directly to paraplegic centers do not develop decubitus ulcers. The use of the Stryker pad and floating mattresses may be of some help here, but they are not to be considered panaceas.

A review of literature on cordotomy emphasizes that careful consideration is necessary before deciding to operate. The literature here summarized shows a surprising number of good results following cordotomy. The neurosurgeons doing the cordotomies, however, were particularly familiar with this procedure in patients with spinal cord lesions. A number of authors reported a surprising number of cordotomies. One series included 45 patients, another series 41 patients.

Emotional problems of paraplegic patients are particularly well summarized. "It must also be borne in mind that while the therapeutic possibilities of bladder, bowel, and motor reeducation constitute a worthwhile objective for the physician, they are not likely to be looked forward to with enthusiasm by the patient, nor are they likely to distract his thoughts from what he was a few weeks earlier—more often than not, a young man in the prime of life and in full possession of his bodily faculties." It usually takes 12 to 18 months of daily contact with comrades similarly afflicted for the paraplegic patient to become resigned to his situation. The author recommends avoiding positive statements to the patient concerning prognosis.

The author warns against pushing motor reeducation to its utmost limits. "Paraplegics are too often required to make heroic efforts to achieve results which, while spectacular and impressive in themselves, cannot be repeated daily during their working life whose ordinary needs are already fatiguing for a normal person." This opinion is typical of the change which has been taking place since World War II when great efforts were made to get patients up on crutches only to find when they were discharged they did not use this method of locomotion.

In brief, this monograph summarizes the conservative treatment of spinal cord injuries during the

last 15 years. There are some new methods and ideas which have been developed over the last few years which have not been included, but these have not yet been fully evaluated.

* * * * *

Tribe and Silver[1] have recently published a summary of the experience at the British National Spinal Injuries Center in regard to involvement of the kidney in spinal cord injuries. In 1944, Dr. Ludwig Guttmann set up the National Spinal Injuries Center at Stoke-Mandeville. Since that time, over 4,000 patients with spinal cord injuries, the majority of traumatic origin, have been seen at the center. Under Dr. Guttmann (now Professor Sir Ludwig Guttmann), a number of important ideas in the management of patients with spinal cord injuries emerged. He challenged the idea that exploratory laminectomy was indicated in the majority of patients with spinal cord injuries. He developed a comprehensive approach to the patient, emphasizing retraining and return to employment. He developed a method of intermittent catheterization which he felt allowed potential function to return before infection interrupted physiological recovery. A special Stoke-Mandeville bed was developed to assure frequent movement of the patient to prevent decubitus ulceration.

His major contribution was the demonstration that simple but meticulous care could delay or prevent many of the complications of urinary infection and skin breakdown. The ward staff was very carefully trained to carry out turning of the patient religiously night and day.

More recently, Sir Ludwig has been interested in the potential in competitive games in helping the patient with spinal cord injury to come back into the stream of normal life. The development of competitive archery, javelin throwing, basketball, and a number of other games in international competition has drawn attention to the potential of many patients with spinal cord injuries.

Tribe and Silver's book on renal failure in paraplegia is another result of the concentration of the paraplegics into a single hospital with permanent follow-up from that center. The term "paraplegia" is used to designate spinal cord injuries at any site. It is based on 220 necropsies and is concerned mainly with renal failure in chronic paraplegia. Forty-six cases (acute paraplegia) died within the first three months. Pulmonary embolism was a common cause of death (16 cases) in this group, although respiratory failure was common in high cervical lesions. Ten patients died from trauma not directly related to the cord injury. It is interesting that none of these early deaths were caused by renal failure. Only 2 out of 43 cases, in which kidney histology was available, showed evidence of pyelonephritis. This is a remarkable change from the experience of World War I where even in early death, kidney involvement was the rule, and very frequently, the cause of death.

Of 174 cases of chronic (living more than three months after paralysis) cases, 123 were of traumatic origin and death was related to paraplegia in 97. In patients dying of renal failure, pyelonephritis was almost always present, but was usually associated with amyloidosis, often with hypertension, and occasionally all three were present. Amyloidosis alone was rare.

These remarks summarize the general part of the book. The remainder is concerned with diagnostic tests of the urinary tract in paraplegics, a section with illustrations of a number of pathological findings, and finally, a discussion of amyloidosis and hypertension in chronic paraplegia. This is the largest and best studied series ever collected. The findings suggest that intermittent catheterization can indeed delay development of severe bladder and kidney infections early in the course of spinal cord injury. However, since all chronic paraplegics had kidney involvement at postmortem, renal infection is still the major block to prolonging the life of paraplegics. We have not found a dependable method of preventing kidney infection over a prolonged period.

new Orenzyme® Bitabs

One tablet q.i.d.

Trypsin: 100,000 N.F. Units, Chymotrypsin: 8,000 N.F. Units.; equivalent in tryptic activity to 40 mg. of N.F. trypsin

DOUBLE STRENGTH

Proteolytic enzyme therapy specifically indicated for the rapid resolution of inflammation and edema as adjunctive therapy in accidental and surgical trauma.

1 tablet q.i.d. provides recommended therapeutic dose at lower cost.

A FULL DAY'S DOSAGE

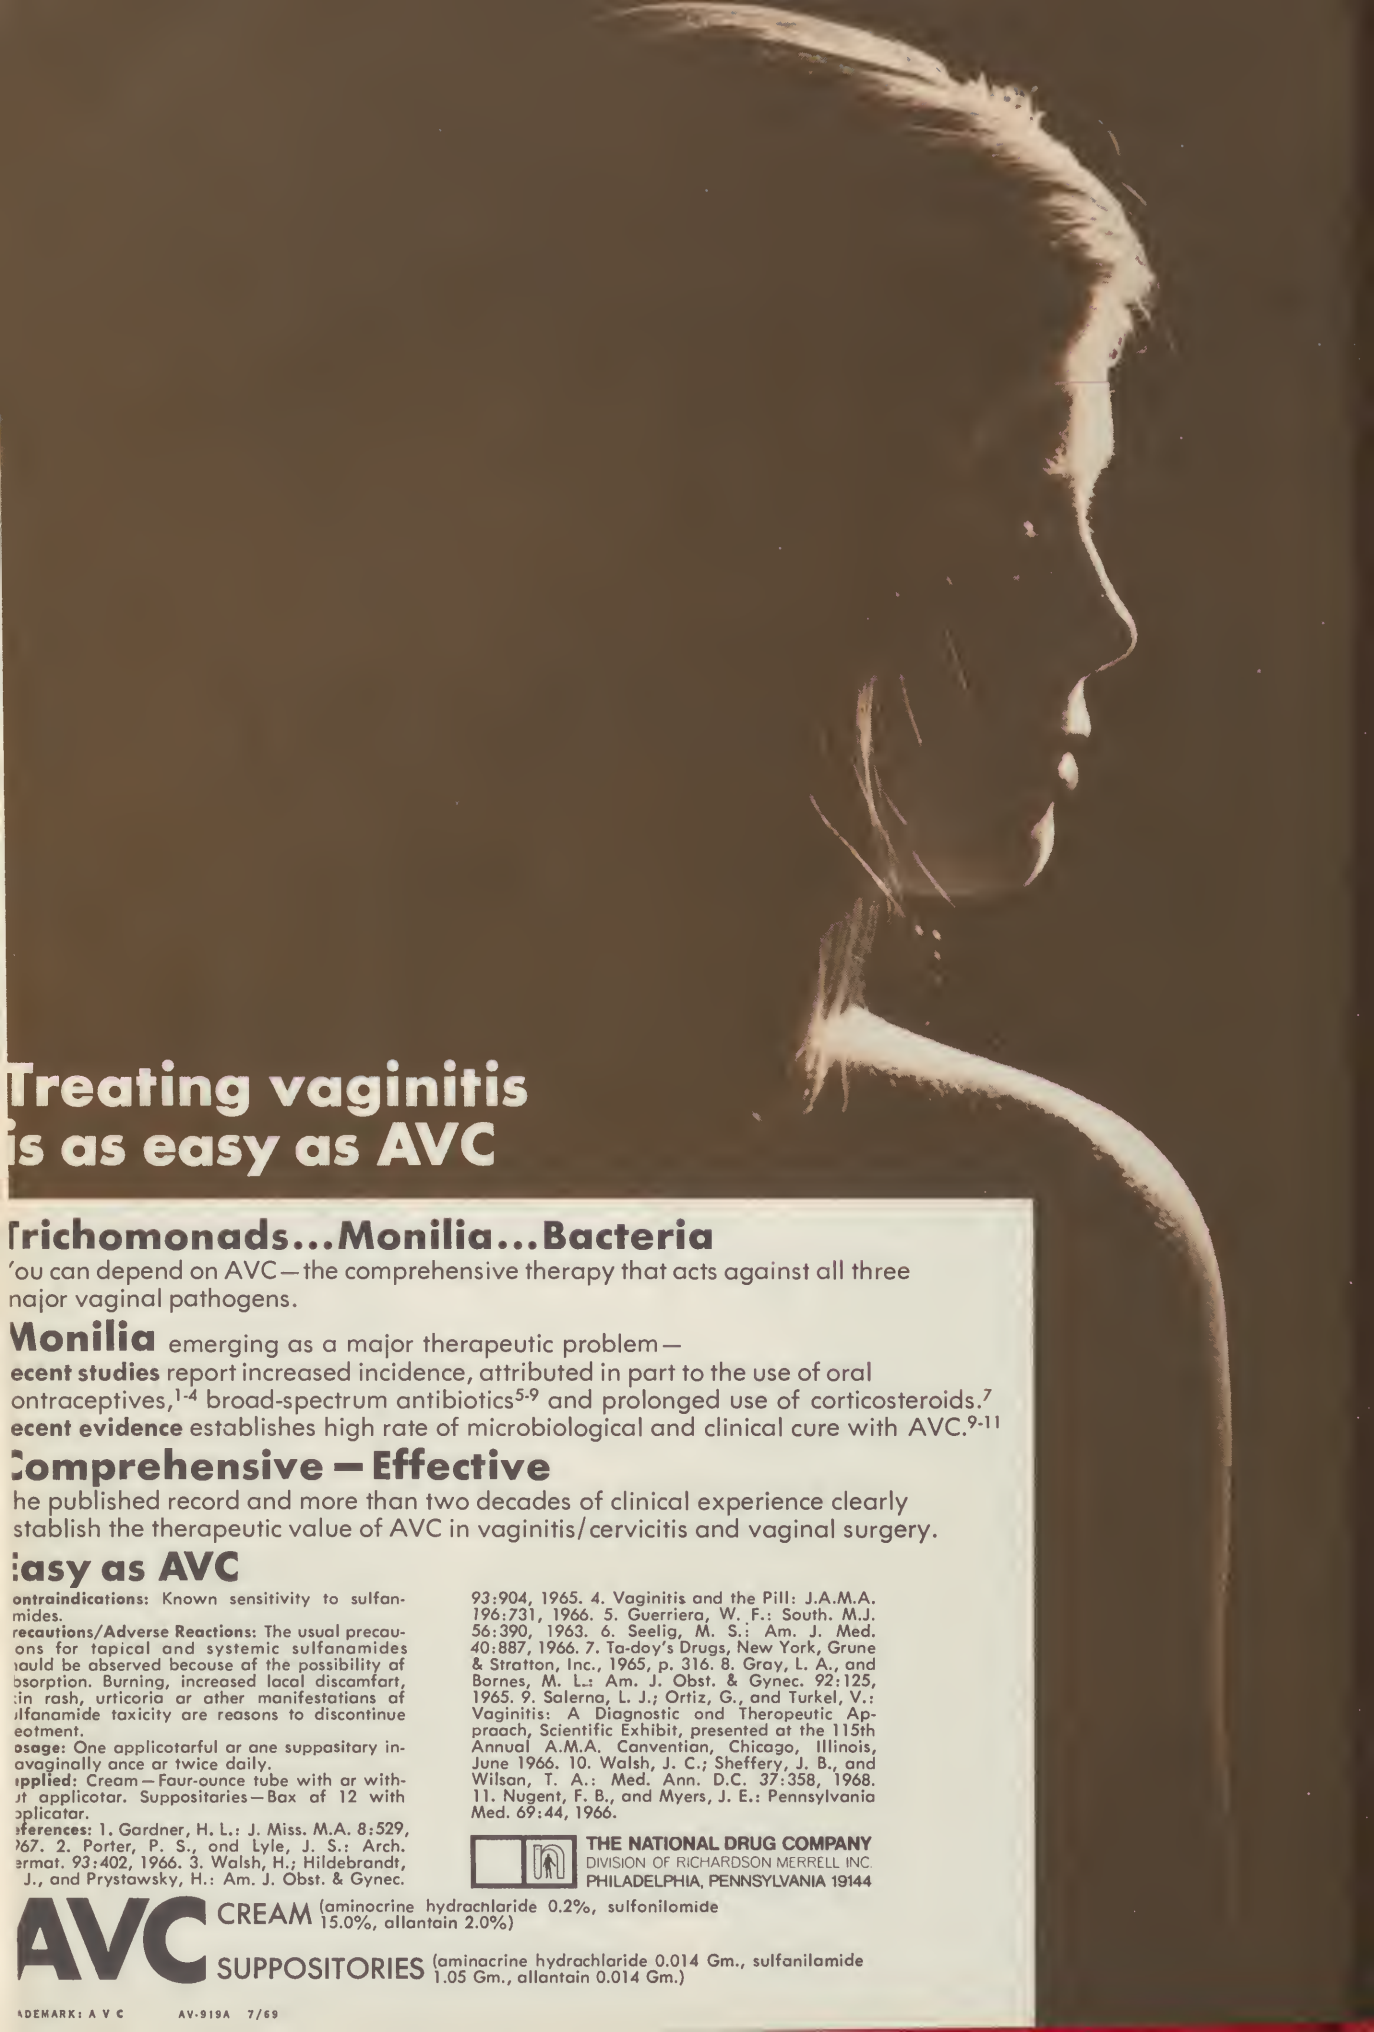
Description: ORENZYME BITABS offers the therapeutic effects of trypsin in an oral form as adjunctive therapy for the rapid resolution of inflammation and edema. ORENZYME BITABS is convenient to use, promotes patient cooperation and is ideally suited for maintenance therapy following parenteral trypsin.

Indications: When used as adjunctive therapy for the rapid resolution of inflammation and edema, good results have been obtained in:

- ☐ Accidental Trauma
- ☐ Postoperative Tissue Reactions.

Other conventional measures of treatment should be used as indicated. In infection, appropriate anti-infective therapy should be given.

Contraindications: ORENZYME BITABS should not be given to patients with a known sensitivity to trypsin or chymotrypsin.



Precautions: It should be used with caution in patients with abnormality of the blood clotting mechanism such as hemophilia, or with severe hepatic or renal disease. Safe use in pregnancy has not been established.

Adverse Reactions: Adverse reactions with ORENZYME have been reported infrequently. Reports include allergic manifestations (rash, urticaria, itching), gastrointestinal upset and increased speed of dissolution of animal-origin surgical sutures. There have been isolated reports of anaphylactic shock, albuminuria and hematuria. Increased tendency to bleed has also been reported but, in controlled studies, it has been seen with equal incidence in placebo-treated groups. (See Precautions.) It is recommended that if side effects occur medication be discontinued.

Dosage: One tablet q.i.d.

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—

Recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]

Recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive — Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfanamides.

Precautions/Adverse Reactions: The usual precautions for tapical and systemic sulfanamides should be observed becouse af the possibility af absorption. Burning, increased local discamfart, skin rash, urticoria ar ather manifestatians af sulfanamide taxicity are reasons to discontinue treatment.

Dosage: One applicotarful ar ane suppasitary intravaginally ance ar twice daily.

Supplied: Cream—Faur-ounce tube with ar without applicotar. Suppositaries—Bax af 12 with applicatar.

New Pride in an Osler Gift

LEE ASH

"This Edinburgh catalogue [including some medical theses by American students at Edinburgh] came from Johnston one Sunday morning in 1902, while I was still in Baltimore. I cabled at once for all the American theses—126, excluding those of West Indian students—and secured them. . . . There are theses of some of the most distinguished American physicians: Bard, Archer, Almon of Nova Scotia . . . Shippen, Morgan, Kuhn, Logan of Phila., Benj. Rush, Physick, Arthur Lee, and others. I gave the collection to the Frick Library of the Medical and Chirurgical Faculty of Maryland." *(Osler, Bibliotheca Osleriana #2278)*

One hundred and twenty of the original collection were turned up by the "Ash Project" recently (and perhaps the other six will be found?). Among the surviving, seven are by Marylanders, precious treasure for the Med-Chi, though, of course, they are not the only medical theses by early Maryland physicians in the library. (Unfortunately, Sir William guessed wrong when he cited the Archer thesis. This proves to be John Randolph Archer, not *our* John Archer, but a less significant Virginian.)

In successive order, the earliest of the Marylanders' theses, represented in the câche, is by James Steuart (*De Spasmo,* 1779), who moved from Annapolis to Baltimore in 1780, was Baltimore's Commissioner of Health in 1805, and an active vaccinationist. Next, in point of time, is the thesis of one of Med-Chi's founders, Daniel Moores (*De Febre Remittente Marilandica,* 1787) who practiced in Harford County, later in Baltimore, and was himself a victim of yellow fever in 1802. John Weems (*De Amenorrhoea,* 1792) does not seem to be known in Cordell's *Medical Annals of Maryland,* but his thesis is dedicated, secondarily, to William Beanes, a Med-Chi founder, of "Star Spangled Banner" fame.

We have not researched the reason for the difference, but John Irvine Troup's thesis (*De Lumbricis Intestinorum Teretibus,* 1793) is cited in Cordell as *De Vermibus,* and it is certainly about parasites—perhaps it was also published with that title. Troup practiced on the Eastern Shore and retired near Baltimore, but not much seems to have been written about him. We have a little better picture of founder Percy Eccleston Noel (*De Angina Tracheali,* 1794), for Cordell commenting on an extant pencil profile says, in part, that he had "a frank, sociable, amiable countenance", which probably endeared him to his patients in Queen Anne's County before his death at 45.

Two of the Maryland theses are of the 19th century. One is William Gibson's "Civis Americanus, de Baltimore" (*De Forma Ossium Gentilitia,* 1809). He was also a house pupil of Charles Bell in London which, with some practical experience, probably brought him to be the first to ligate the common iliac artery in 1812 (Garrison/Morton 2944). His other contributions to American medicine are well known, and he is surely the most influential physician represented in the present lot. The last of this clutch of Maryland theses is by John Revere (*De Insania,* 1811), Paul Revere's youngest son, who left the New England climate for the central states, and remained in Baltimore for about 15 years, mid-course in an eventful career.

Would there were space for descriptions of the other theses! Perhaps at another time? Meanwhile, these 120 theses are kept together with the Osler books and are available for research.

SEMIANNUAL MEETING
MEDICAL AND CHIRURGICAL FACULTY OF MARYLAND

DATES OF IMPORTANCE TO ALL PHYSICIANS, THEIR WIVES, AND GUESTS

Thursday, Friday, Saturday, September, 10, 11, 12, 1970
at the
Hotel Hershey, Hershey, Pennsylvania

The Semiannual Meeting in Hershey, which proved so successful in 1969, has again been scheduled in that location with even more attractive events for all.

THURSDAY, SEPTEMBER 10

Executive Committee and Council Meetings

Monte Carlo Night—8:30 PM—a real family night of fun

FRIDAY, SEPTEMBER 11

Business Meetings: House of Delegates—9:30 AM
Woman's Auxiliary—9:30 AM

Scientific Program on Environmental Pollution—11:00 AM
A panel discussion of interest to all physicians, their wives, and guests

MMPAC Luncheon Meeting—1:00 PM
A meeting of the Maryland Medical Political Action Committee, with a prominent speaker of interest to everyone

Tour of Hershey Medical Center—2:30 PM
This tour will include the Medical Sciences Building and Teaching Hospital, plus the animal facilities for those who are interested. Physicians and their guests are invited.

Golf Tournaments—Men's—1:00 PM at the Hershey Country Club
Ladies'—1:00 PM at Hotel Hershey
Mixed—2:00 PM at Hotel Hershey

Cocktail Party and Banquet—7:00 PM
Entertainment by MARK RUSSELL, well-known Washington wit and pianist

SATURDAY, SEPTEMBER 12

Scientific and Business Meetings
Maryland Chapter, American College of Surgeons
Maryland Diabetes Association
Maryland Society for the Rheumatic Diseases
Maryland Association of Physicians in Chronic Disease Facilities
Board of Directors, Maryland Academy of General Practice

Tours of interest to all—to be announced

Cocktail Party and Dinner Dance—7:00 PM
Plus entertainment planned by the Woman's Auxiliary

Have you made your hotel reservation? If not, fill in the reservation form and mail today. The Semiannual Meeting will provide a weekend of postgraduate education plus many forms of entertainment and relaxation. The complete program and reservation form for the various events will be mailed to all members of the Faculty in August and will also be included in the August issue of the JOURNAL. If you are not a member of the Faculty and wish a copy of the program and reservation form, please contact the Faculty office.

PLAN TO SPEND THE WEEKEND OF SEPTEMBER 10, 11, 12, 1970
AT THE HOTEL HERSHEY WITH YOUR FAMILY AND FRIENDS

Arlie R. Mansberger, Jr., MD, Chairman
Committee on Program and Arrangements

For hotel reservation form, see page 7.

Certified Medical Representatives Institute Research Study

The first phase of a broad research study for the Certified Medical Representatives Institute was conducted during the months of August, September, and October 1966. Two thousand physicians, dentists, and pharmacists were surveyed by mail to determine their attitudes concerning pharmaceutical company representatives and to determine their reactions to the proposed Certified Medical Representative Program. A small sample of detailmen, working in the Richmond and Roanoke, Virginia areas, was interviewed for their opinions and reactions.

Approximately 23% of the professional groups contacted returned the survey forms and many of the individuals wrote extensive comments. Data obtained, concerning years in practice and field of specialty, indicate returns from a representative cross section of the medical field.

Professionals and detailmen were in general agreement on the primary issues, although there were small percentage differences in the different geographical areas. The results showed:

(1) Professional groups agree that the pharmaceutical representative serves an important function. Three fourths of the physicians and dentists and over 80% of the pharmacists see a need for contacts by medical representatives. About one out of ten individuals surveyed view the detailmen as a nuisance and unnecessary.

(2) Medical groups see a definite need for greater training and specialization of medical representatives. Only one out of four professionals think that the pharmaceutical representatives are well trained. In response to an open-end question concerning the training of the pharmaceutical representative, the majority of the comments were negative.

(3) Detailmen and professionals feel that the CMR Program is a positive solution to the need for more knowledge and training. Eighty-four percent of the detailmen interviewed and over 70% of the professionals believe that the CMR Program would be valuable. In a free-response question, there were three times as many positive responses concerning the value of the CMR Program as negative responses.

(4) Suggestions for appropriate and important courses to accomplish the goals of the CMR Program were consistent among the professional groups in the different geographical areas. Pharmacology, medical terminology, physiology, and chemistry were considered important in all subsamples. The pharmacists, more than the other professional groups, believe that business and self-improvement courses would be desirable.

Further phases of the CMR research study will involve:

(1) Additional mail surveys of professional groups in 10 to 15 different geographical areas

(2) In depth interviews with selected professional personnel

(3) Conferences with sponsoring manufacturers

(4) Several group meetings with medical representatives.

The curriculum developed for the Certified Medical Representatives Institute was based upon initial survey results. Exact course content was determined by studies still in progress and consultations during the course development. Courses in economics and business psychology were offered first, followed by technical courses. The CMR educational program involved a variety of self-study instructional techniques. Programmed instruction was used extensively, although this necessitated a longer development period for some subjects. General texts, special study guides, workbooks, and review procedures were also used.

The two-year CMR study program contains approximately 300 hours of study time. There are individual variations in the amount of time spent on various programs, depending on the amount of related background work. If a course requires previous knowledge about a particular subject, review procedures and supplementary study guides are provided.

To obtain certification and be designated as a Certified Medical Representative, a pharmaceutical representative, sponsored by his company, will be required to pass five parts of a certification examination. Examinations will be administered throughout the country several times during the calendar year. A representative ordinarily would take one part of an examination at a time, with subject areas grouped as below.

Part I (Economics and Psychology)

Part II (History of the Pharmaceutical Industry, Government Regulations, and Professional Ethics)

Part III (Pharmacology and Medical Terminology)

Part IV (Chemistry and Research Methods)

Part V (Medical Sciences)

Every effort is made to develop meaningful and valuable course content so that individuals becoming certified will readily obtain professional recognition by medical groups.

Participating pharmaceutical companies include: CIBA Pharmaceuticals, Dorsey Laboratories, A. H. Robins, Syntex Laboratories, and Warner-Chilcott Laboratories.

Ed. Note: Results from the 1,160 questionnaires that were returned to the Faculty offices, concerning Faculty activities, show physicians feel that detailmen should be accredited (493 said yes, 359 said no). However, they felt that the detailmen should not be licensed (294 to 597). Finally, an overwhelming majority (771 to 142) thought that the representatives should be required to have continuing education.

It's in the Negative

"Why, that picture's an outrage!" she stormed. "Now I ask you does it look like me?" "Madame," replied the suave photographer, "the answer is in the negative." . . .

Increased interest rates on savings certificates

from Baltimore Federal

Now you can earn increased interest with one of Baltimore Federal's four new savings certificate plans—higher interest that means so much in down-to-earth terms, in the ways you want to enrich life for your family and yourself.

Baltimore Federal now offers 5-1/4% per annum on certificates of $1,000 or more invested for six months... 5-3/4% per annum on one-year certificates of $5,000 and up... a handsome 6% per annum on certificates of $12,000 or more invested for two years ... and an extraordinary 7-1/2% per annum on one-year savings certificates of $100,000 or more. All certificates may be purchased in larger-than-minimum amounts in multiples of $1,000. Interest on all four certificate plans is compounded and credited quarterly, or paid direct to you by check.

Stop in at any convenient Baltimore Federal office and talk over the best savings certificate plan for you. Let Baltimore Federal put a little more of the good life in your life.

anxiety: the tyrant

Excessive anxiety can often dominate the patient made vulnerable by illness, surgery, prolonged emotional stress. It can induce or aggravate symptoms, disrupt medical management, divert energy the patient needs for recovery.
The antianxiety action of Librium® (chlordiazepoxide HCl)—used adjunctively or alone—has demonstrated clinical usefulness in virtually every field of medical practice where anxiety complicates the patient's condition.

for the patient ruled by anxiety

Librium® (chlordiazepoxide HCl) 5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.
Contraindications: Patients with known hypersensitivity to the drug.
Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.
Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.
Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

INDEX MEDICUS

Our completely new 100-bed facility is NOW OPEN

We are Baltimore's most centrally located nursing home. Minutes from Towson, Roland Park, Homeland, and all of northern Baltimore's hospitals.

The right attitude

. . . has earned us an enviable reputation in Baltimore's wide spectrum of health care establishments. We feel that our approach to the problems of elderly, chronically ill, and convalescent patients makes us different. Our people give of themselves beyond the call of duty to our guests with more than the amount of service expected.

If the RIGHT ATTITUDE is what you're looking for . . . . . with day and night vigil by professional nurses . . . individually programmed meals under the control of a staff dietician . . . physical, occupational and recreational therapy . . . a pleasant, home-away-from-home atmosphere . . . . . Edgewood Nursing Home should be your first preference.

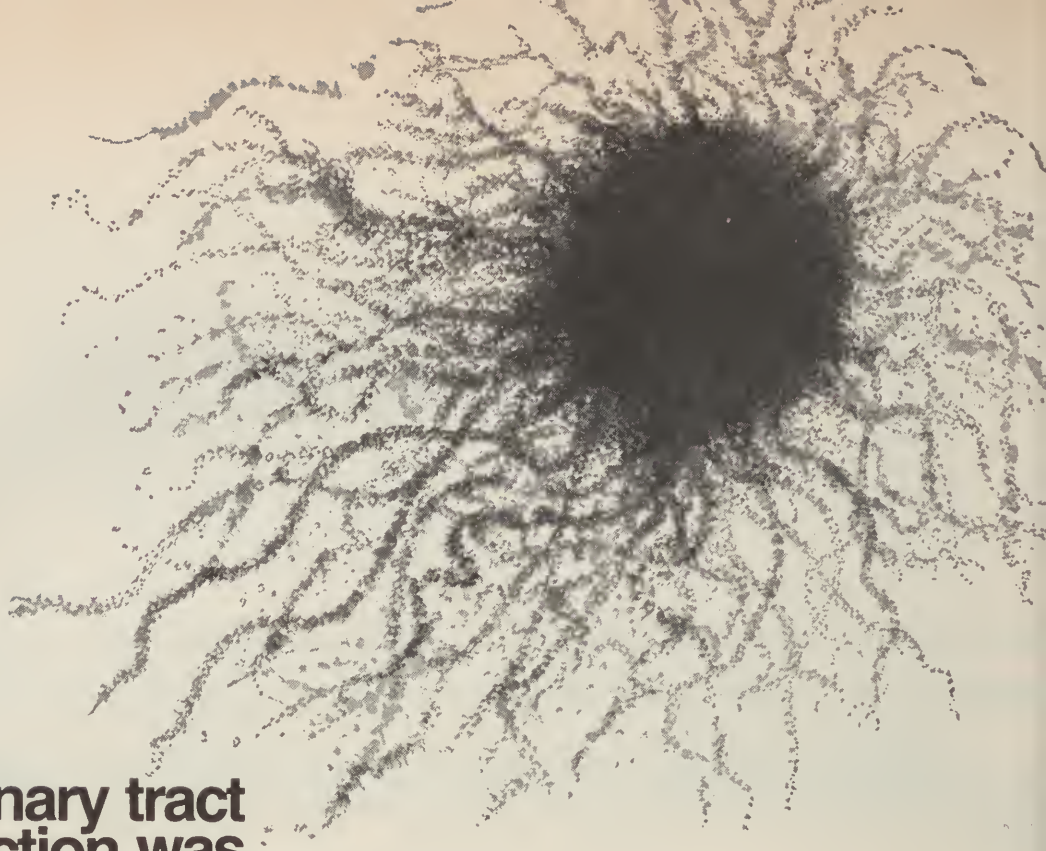
EDGEWOOD
NURSING & CONVALESCENT HOME
6000 Bellona Avenue, 323-4223

Lutrexin®

HW&D BRAND OF LUTUTRIN

3000 UNIT TABLETS

IN THE TREATMENT OF FUNCTIONAL DYSMENORRHEA AND SELECTED CASES OF PREMATURE LABOR AND 2ND AND 3RD TRIMESTER THREATENED ABORTION



- LUTREXIN, the non-steroid "uterine relaxing factor" has been found to be useful by many clinicians in controlling abnormal uterine activity.
- Literature on indications and dosage available on request.
- No side effects have been reported, even when massive doses (25 tablets per day) were administered.
- Supplied in bottles of twenty-five 3,000 unit tablets.

(In vivo measurement of Lutrexin on contracting uterine muscle of the guinea pig.)

HYNSON, WESTCOTT & DUNNING, INC. BALTIMORE, MARYLAND 21201

(LTR23)

A urinary tract infection was eliminated last week

testinal monilial overgrowth has appeared this week

For women who are diabetic or debilitated, oral antibiotic therapy often sets the stage for monilial overgrowth in the intestine.

When you anticipate such a problem, take action with DECLOSTATIN 300. It combines the broad-spectrum potency of demethylchlortetracycline with the antifungal effectiveness of nystatin—it helps avoid monilial take-over. Experience has shown DECLOSTATIN to be highly useful for many women patients; individual culture studies will show exactly where this usefulness may best be applied.

It doesn't let monilia begin where bacteria end. Declostatin® 300

Demethylchlortetracycline HCl 300 mg and
Nystatin 500,000 units Capsule-Shaped Tablets Lederle

Effectiveness: Because its antibacterial component is DECLOMYCIN® Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose-related. Transient, reversible, nephrogenic diabetes insipidus with excessive thirst and polyuria (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: One tablet b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

Reflections on the 1968 Olympics Conducted at High Altitude, Thomas F. Waddell, MD 59

"The prime reason for our success at the 1968 Olympics was our early formation and training at Lake Tahoe."

Physical Medicine in Athletic Rehabilitation, Alvin M. Brown, MD .. 61

"Heat and cold are the two most generally accepted physical measures used in modern athletic rehabilitation. However, therapeutic exercises, massage, splinting, and compression bandaging are becoming increasingly more important in the restoration of the injured athlete to maximal functional capacity."

Athletic Competition for Girls, Tenley Albright, MD 65

"A superbly fit athlete with a love for her sport is hard to hold down. Her enthusiasm for her sport is bound to reflect in her enthusiasm for life and for whatever else she does. Yet, I feel that we, who are in the position to do otherwise, have neglected to encourage young women to participate in competitive sports."

The Use of Drugs in Athletics, William J. Kinnard, Jr., PhD 67

"A major problem today is drug abuse among young people. We, as adults, must help them develop the respect for drugs that can only come from their judicious use. Let's be sure that we are working with the "natural" athlete and not one who, through the excessive use of drugs, is forced to perform at a level far past his normal limitations."

The Use of Drugs in Athletics, Gary G. Buterbaugh, PhD 69

"The special health hazards inherent in athletics often lead to valid medical reasons for administering a drug or drugs to an athlete. It must be emphasized that these 'restorative' drugs are not intended to be administered to an injured athlete for the purpose of allowing him to continue competition in spite of the injury."

Psychological and Psychosomatic Problems of Athletes, Burris F. Husman, EdD 71

"The psychological problems of athletes are those related to behavior. Likewise, anything influencing the mental processes or behavior of the athlete can have an effect on him physically."

Equipped for the thyroid emergency?

When an ambulance arrives with the unexpected patient presenting the classical picture of myxedema coma, is your hospital suitably equipped? It is if SYNTHROID® (sodium levothyroxine) injectable is at hand. You are also ready to conveniently handle post-operative thyroid medication situations until oral therapy can be reinstated.

In tablet form this single entity synthetic thyroid provides smooth, predictable response for thyroid replacement. An excellent drug for long-term therapy.

But in an emergency, when rapid replacement is needed to sustain life, prompt clinical response is essential. SYNTHROID injection makes this therapy instantly available. Is it available in your hospital?

Levothyroxine has a high binding capacity for serum proteins in contrast to other thyroid medicaments that may contain a thyroactive agent with low binding capacity. *The bound levothyroxine is totally measurable using the serum PBI test. It is not unusual to find PBI levels of 8-10 mcg. per 100 ml. of serum.*

INDICATIONS: SYNTHROID (sodium levothyroxine) INJECTION is specific replacement therapy for diminished or absent thyroid function resulting from primary or secondary atrophy of the gland, congenital defect, surgery, excessive radiation, or antithyroid drugs. It is indicated in myxedematous coma and other thyroid dysfunctions where rapid replacement of the hormone is required. When a patient does not respond to oral therapy, SNYTHROID (sodium levothyroxine) INJECTION may be administered intravenously.

PRECAUTIONS: As with other thyroid preparations, overdose may cause diarrhea or cramps, nervousness, tremors, tachycardia, insomnia and continued weight loss. These effects may become apparent in from 4 days to three weeks. Therefore, patients should be kept under close observation. Medication, in such cases, should be stopped for 2 to 6 days, then resumed at a lower level. In patients with diabetes mellitus, look for possible changes in metabolic activity which may affect insulin or other antidiabetic drug dosage requirements.

CONTRAINDICATIONS: Thyrotoxicosis, acute myocardial infarction.

SIDE EFFECTS: Side effects are secondary to increased rates of body metabolism: sweating, heart palpitations with or without pain, leg cramps, weight loss, diarrhea, vomiting and nervousness. Myxedematous patients with heart disease have died from abrupt increases in dosage of thyroid drugs. In most cases, a reduction in dosage followed by a more gradual adjustment upward will indicate the patient's dosage requirements without the appearance of side effects.

DOSAGE AND ADMINISTRATION: In myxedematous stupor or coma, with no evidence of severe heart disease, 200 to 400 mcg. of SYNTHROID (sodium levothyroxine) INJECTION may be administered intravenously utilizing a solution containing 100 mcg. per ml. Detectable effects are usually observed by the sixth hour after injection and are fully appreciated during the following day. A repeat injection of 100 to 200 mcg. may be given on the second day if significant improvement has not occurred. The intravenous use of sodium levothyroxine in myxedematous coma is advantageous because it produces a predictable increase in the concentration of protein-bound iodine, eliminates the need for multiple doses until oral therapy is reinstated, circumvents the uncertainty of oral absorption, and avoids the risk of pulmonary aspiration.

SUPPLIED: SYNTHROID (sodium levothyroxine) INJECTION is supplied in 10 ml. vials containing 500 mcg. of lyophilized active ingredient and 10 mg. of Mannitol, N.F.; a 5 ml. vial containing Sodium Chloride Injection, U.S.P. is provided as diluent.

Also supplied as SYNTHROID (sodium levothyroxine) TABLET in color coded compressed tablets, and in seven strengths: 0.025 mg. (orange), 0.05 mg. (white), 0.1 mg. (yellow), 0.15 mg. (violet), 0.2 mg. (pink), 0.3 mg. (green), and 0.5 mg. (blue). Each strength is supplied in bottles of 100 and 500 tablets.

FINAL PROOF TO PRINTERS

The completely revised and up-to-date book on Laws, Rules And Regulations With Which Physicians Must Comply is now being printed. Copies should be in the mail to all members early in the fall.

Of particular interest to members are new laws concerning admissions to mental health institutions. Where the law touches physicians most directly is in the definitions of mental disorder, mental illness, and mental retardation, and in the provisions dealing with the admission of mentally disordered persons to hospitals. The provisions dealing with "Insanity as a Defense in Criminal Cases" have not changed substantially. See the new book for specifics.

MEDICARE AND MEDICAID RECIPIENTS WILL ALL HAVE MEDICARE PART B

An additional confusion within the Medicaid program will soon be solved when all recipients over age 65 will have Part B of Medicare purchased for them.

Not only will this reduce considerable paperwork for Blue Shield, which must process all such cases before forwarding them to the State Health Department, but it will also provide these people with fully paid medical care.

About 12,000 people are covered and the state will pay about $768,000 for the Part B coverage. The complete program, which took effect July 1, will cost the state about $1 million.

Drugs not covered under the federal program will continue to be paid for under the state's Medicaid program.

NARCOTICS REMINDER

There have been some recent problems involving physician's prescriptions for narcotics. For those physicians unfamiliar with this issue, federal law prohibits refills on any narcotic prescriptions or telephone calls to pharmacists by physicians for narcotic prescriptions.

MARYLAND AUXILIARY WINS AWARDS

The Woman's Auxiliary to the Faculty won an award for the greatest increase (408.90%) of any state in the collection of AMAERF funds. The state's

MARYLAND AUXILIARY WINS AWARDS (cont'd)

contribution to the national fund totaled $29,492.45 (June 1, 1969 to May 31, 1970). In addition, three Maryland counties received achievement certificates, all presented at the AMA Auxiliary meeting in Chicago in June.

Baltimore County:	For the largest per capita contribution 38 members - $67.08 per capita
Montgomery County:	For the largest contribution in the 101-200 membership category 183 members - $6,347.84
Baltimore City:	For the largest contribution in the 201-500 membership category 322 members - $9,143.91

MEDICAID MEMOS

Effective July 1, 1970, Medicaid recipients will carry a new plastic identification card. When issued, it will replace the old paper card. BE SURE TO CHECK THE EXPIRATION DATE ON ALL CARDS PRESENTED FOR SERVICE.

The time schedule for Medicaid payments is about six to eight weeks from the date the Medicaid bill is received. If patients are Medicare recipients as well, the time schedule is about ten to twelve weeks. If physicians have any substantial backlog of unpaid accounts, let the Faculty office know. Or you may write to Mrs. Florence Sokol, Provider Relations Specialist, Department of Health and Mental Hygiene, 301 West Preston Street, Baltimore, Md. 21201, or call 383-3010, ext. 1468.

PROFESSIONAL LIABILITY INSURANCE

Not only Maryland physicians, but those in other areas as well are experiencing an increase in their professional liability insurance premiums. Latest information indicates that in Vermont and Michigan, rates increased 100%; in Ohio, 75%; in Philadelphia, 250%; in California 95% in 1968 and 110% in 1969; and in New York State, 55%.

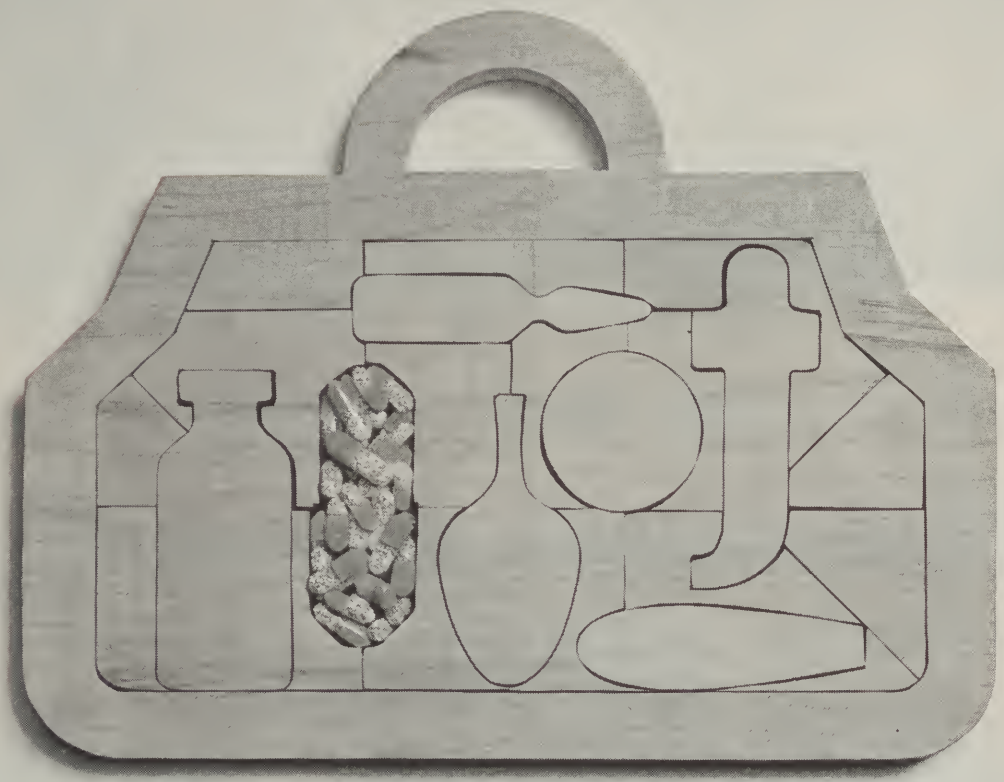
NOT A CURE ALL—BUT
THE BEST AIDE KNOWN

Fast...long-lasting relief of aches and pains of colds and flu



with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 6,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

See Clinical Considerations section on last page...

Injectable Garamycin®

brand of gentamicin sulfate injection

Schering

ADULT DOSAGE GUIDELINES

See definitive prescribing information in Package Insert.

Patients with Normal Renal Function

Total Daily Dose (administered in two, three, or four divided doses)			
	Less Severe	Resistant/ Moderately Severe	Serious/Life-Threatening
Urinary Tract Infections (due to susceptible strains of gram-negative bacteria)†	0.8-1.2 mg./kg. for 7-10 days	Larger doses or additional antibacterial therapy should be considered in severe urinary tract infections or in resistant cases involving the renal parenchyma or anatomic anomaly.	up to 5 mg./kg.
Other Infections including bacteremia, infected surgical wounds, severe soft tissue infections, and respiratory tract infections (due to susceptible strains of gram-negative bacteria)	3 mg./kg. for 7-10 days		

†Alkalinization of the urine may be a useful therapeutic adjunct.

Patients with Impaired Renal Function

To minimize the risk of ototoxicity in patients with impaired kidney function, only the first dose should be that normally recommended. Each subsequent dose should be half or less of that recommended for patients with normal renal function, depending upon the degree of renal impairment.

In patients with renal failure who are undergoing 14-hour hemodialysis twice weekly, administration of 1 mg./kg. GARAMYCIN Injectable at the end of each dialysis period has been suggested.

Clinical Considerations

Indications: GARAMYCIN Injectable is clinically effective in infections due to susceptible strains of gram-negative bacteria, including *Pseudomonas aeruginosa,* and species of indole-positive and indole-negative *Proteus, Escherichia coli,* and *Klebsiella-Aerobacter.* Bacteriologic studies should be conducted to identify the causative organism and to determine its sensitivity to gentamicin sulfate. Sensitivity discs of the drug are available for this purpose. If the susceptibility tests indicate that the causative organism is resistant to gentamicin sulfate, other appropriate antibiotic therapy should be instituted.

IN VITRO INHIBITION OF CLINICALLY IMPORTANT BACTERIA BY GENTAMICIN SULFATE (TUBE DILUTION STUDIES)

BACTERIA	No. of Strains Tested	No. of Strains (%) Inhibited by: 4 mcg./cc. or less		8 mcg./cc. or less*		No. of *In Vitro* Studies
Staphylococcus aureus	1,210	1,200	(99%)	1,206	(99%)	11
Pseudomonas aeruginosa	885	771	(87%)	828	(93%)	16
Escherichia coli	836	736	(88%)	779	(93%)	11
Indole-positive and indole-negative *Proteus* species	477	210	(44%)	358	(75%)	12
Klebsiella-Aerobacter species	292	205	(70%)	231	(79%)	10

*Number of strains (%) of gram-negative bacteria inhibited by 10 mcg./cc. or less are as follows: *Pseudomonas aeruginosa,* 828 (93%); *Escherichia coli,* 792 (95%); *Proteus* species, 393 (82%); *Klebsiella-Aerobacter* species, 284 (97%). From same studies as above.
Source: Package Insert

This drug should be limited to the treatment of serious infections caused by gram-negative bacteria, particularly *Pseudomonas aeruginosa, Proteus* and other susceptible organisms, with due regard for relative antibiotic toxicity. Therefore, the drug should be considered for use against gram-negative: 1. Bacteremia; 2. Infected surgical wounds; 3. Severe soft tissue infections, including burns complicated by sepsis; 4. Respiratory tract infections; and 5. Selected cases of urinary tract infection.

Contraindications: GARAMYCIN Injectable is contraindicated in in dividuals with a history of hypersensitivity or toxic reactions t gentamicin.

Warnings: Patients receiving treatment with GARAMYCIN should be under close clinical observation because of the toxicity associated with the use of this drug. Ototoxicity, vestibular and auditory, can occur in patients, primarily those with preexisting renal damage, treated with GARAMYCIN Injectable, usually for longer periods or with higher doses than recommended.

GARAMYCIN Injectable is potentially nephrotoxic, and this should be kept in mind when it is used in patients with preexisting renal impairment. Kidney function diminished by infection of the upper urinary tract may, however, improve during effective treatment with GARAMYCIN Injectable.

Concurrent administration of potentially ototoxic drugs such as streptomycin and kanamycin or of potentially nephrotoxic drugs such as polymyxin, colistin, and kanamycin with gentamicin sulfate has not been shown to afford any clinical advantages and, moreover may result in additive toxicity. Monitoring of vestibular, cochlear, and renal function will provide guidance for therapy in such cases.

Precautions: In patients with impaired renal function in whor serious infection develops, serum concentrations of the drug ma rise, with consequently increased risk of ototoxicity. In these pa tients or in those in whom recommended dosage or duration c therapy must be exceeded as a life-saving measure, routine studi of kidney function should be performed when possible. These ma be supplemented by evaluation of the vestibular and auditory fun tion and measurement of serum concentration of the drug whe feasible. Serum concentrations of gentamicin should be maintaine below the range of 10-12 mcg./ml. to reduce risk of ototoxicity.

Ordinarily, treatment should not be given for more than 7 to 1 days or be repeated unless required for serious infection not r sponsive to other agents.

As with other antibiotics, treatment with GARAMYCIN Injectab may occasionally result in overgrowth of nonsensitive organisms. superinfection occurs, appropriate therapy is indicated.

Safety for use in pregnancy or the potential for fetal ototoxicity c nephrotoxicity have not been established. Studies in pregnant an mals have not revealed teratogenic or ototoxic effects in the fetu GARAMYCIN Injectable should not be used in pregnant patients in women of childbearing age unless its use is deemed advisab by the physician.

Adverse Reactions: The overall incidence of ototoxicity consider related to treatment with GARAMYCIN Injectable was 2.8 per ce (16 of 565 patients). Contributory factors (two or more factors we relevant to most patients) were as follows: 10 had azotemia, received a total of 1 gram or more of the drug, 7 had recently r ceived other potentially ototoxic antibiotics (streptomycin or kan mycin), and 5 were over 60 years of age. Six also had decreas high-tone hearing acuity, which returned to or toward normal the 4 patients retested.

Analysis of BUN data indicated that 4 (2%) of 172 patients show increases in BUN that were probably related to treatment wi GARAMYCIN Injectable. Of 20 increases probably or possibly relat to treatment, 7 were reversible, 9 occurred in terminal patients, a 4 had no follow-up.

Other adverse reactions associated with treatment were one instar each of urticaria, decreased hematocrit, and reversible depressi of granulocytes with normal bone marrow. Other rarely report and possibly treatment-related adverse reactions were anemia, creased reticulocyte count, rash, purpura, drug fever, hypotensi convulsions, twitching, salivation, nausea, vomiting, increased tra aminase activity (SGOT or SGPT), increased serum bilirubin, c creased serum calcium, and joint pain.

Packaging: GARAMYCIN Injectable, 40 mg./cc., 2-cc. multiple-d vials, for intramuscular administration.

For more complete prescribing details, consult package insert Physicians' Desk Reference. Schering literature is also availa from your Schering Representative or Medical Services Departme Schering Corporation, Union, New Jersey 07083.

ARTHUR E. COCCO, MD
Journal Representative

Baltimore City Medical Society

Board of Directors Meets

The Board of Directors of the Baltimore City Medical Society met on June 2, 1970 at 4:30 PM, at 1211 Cathedral Street.

The minutes of the May 5 meeting were approved as read.

C. Lee Randol, MD, presented a critique of the People's Free Medical Clinic, Inc., which is located on Greenmount Avenue. The clinic's primary aim is based on the premise that good medical care for all is a right and not a privilege. The aims of the clinic, therefore, are as follows:

1. That current health care resources can be made more accessible to a local community by:
   a. providing a focal point for evaluation of individual health needs.
   b. providing a convenient source of information on existing resources.
   c. providing assistance in utilizing those resources.
2. That primary health care can be more convenient, economical, and responsive to the particular community needs by:
   a. improving community location, administration, and operation.
   b. removing primary care from hospital outpatient departments and emergency rooms.
3. That quality of overall health care can be improved by:
   a. providing convenient facilities for primary care to encourage utilization of health care facilities at earlier stages of disease.
   b. relieving secondary and tertiary health care facilities (hospitals) of some of the burden of primary health care.
   c. providing health-related educational, counseling, and other social services in the same primary care facility.

After much discussion, the Board of Directors decided that the physicians presently in practice in the area surrounding the clinic should be contacted and questioned concerning its acceptance and approval. The Board agreed that, at face value, there seems to be no unusual, illegal, or unethical aspects in the operation of the clinic and that the idea is, in general, an excellent one, but that the organizational structure would require a more complete investigation before the sanction of the society could be offered.

The activities of the Policy and Planning Committee were reported by Philip F. Wagley, MD. The committee proposed the formation of a Baltimore City Medical Society scholarship to be awarded to a needy Negro student from Baltimore city in the amount of $1,000 a year for eight years. The selection of the recipient would be made by a Scholarship Committee, with final approval from the Board. The following factors would be taken into prime consideration when selecting a candidate:

1. Interest in medical training
2. Character traits
3. Scholastic standing
4. Citizenship and leadership
5. Financial need

The candidate should receive the recommendation of his principal and two faculty members. Each school will be requested to screen applicants and submit not more than two names to the committee.

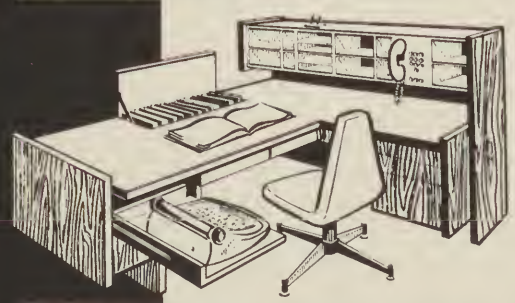
The Board agreed that this proposal should be brought before the next general meeting of the society for consideration.

The Ad Hoc Committee to investigate the Mary-

land Artificial Kidney Treatment Fund briefly reviewed the fund's organization and operation and found several ethical problems associated with it. Further investigation is planned and the Board agreed that if the committee felt there were indeed some unethical practices, the matter should be referred to the Medical and Chirurgical Faculty Mediation Committee for consideration.

In response to a request for nominees to be considered as recipients of the Governor's Award for the promotion of the physically handicapped, the Board suggested that the names of Paul Richardson, MD, and Douglas Carroll, MD, be submitted.

The Board agreed to write to Mayor D'Alesandro offering to submit a list of names from which he might make a selection when filling medical posts in the city government.



No meeting of the Board was held in July. The next scheduled meeting will be August 11.

Further discussion of the selection of a Peer Review Committee was entertained by John N. Classen, MD, and is now under advisement.

A case concerning a problem of patient-physician relationship was discussed and referred back to the Professional Relations Committee for further investigation.

The meeting was adjourned at 6:00 PM.

K. Merrill Sumey, Resident Manager

A unique opportunity to invest in the health of America:

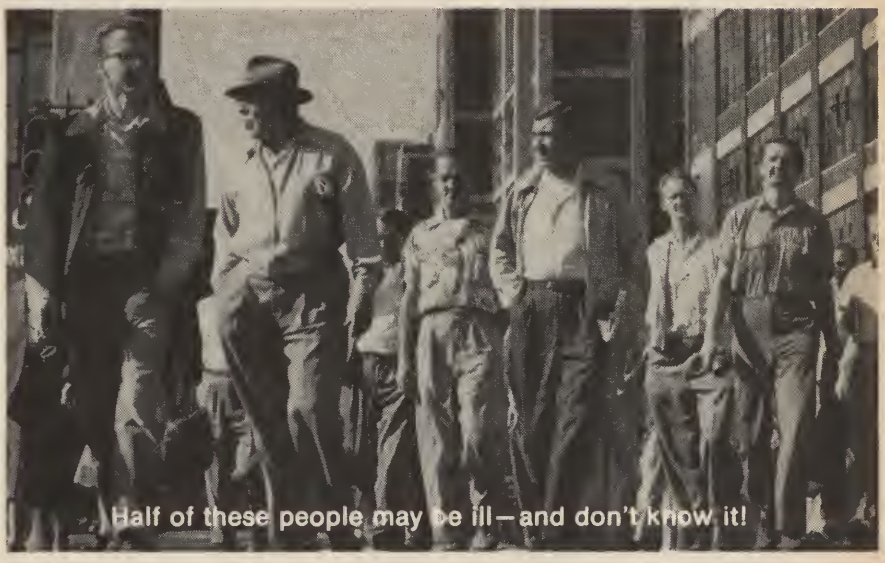
Imagine being paid for service to thousands of people who may never visit your office, and may never take any of your time at all!

The service is called "Multiphasic Screening." You know of it, of course, and no doubt recognize that some form of *low-cost preventive medicine* offers the only real hope for relieving the growing crisis of medical care for an expanding population.

Consider an entirely new field that will help Americans everywhere lead longer, healthier and more productive lives—through a revolutionary method of early disease detection. Consider that *40% to 50% of those tested* have a serious disease or disorder—and it will hardly surprise you that there's a broad market for Multiphasic Screening.

Now you can invest

Until now, there were practically no investment opportunties in this field. Today, however, Health Screening Centers, Inc., offers you an invitation that changes all that. Now, *you can invest* in this new and exciting area of preventive medicine, and take an active role in its growth and development.



Professionally, you will find this one of the most *satisfying* investments you can make. And, with your special knowledge and background plus the assistance we give you—this can also be the most *profitable* investment you're ever likely to make.

What is HSC?

Health Screening Centers, Inc., has been organized to coordinate the licensing and operation of a nationwide network of early disease detection centers—mobile and in-plant—utilizing automated, miniaturized, electronic and computerized equipment.

A special staff is trained to operate the facilities and to provide efficient, low-cost delivery of accurate laboratory and physiological test results to referring physicians. A basic HSC facility of prime van and trailer is equipped for fundamental health history review and dozens of tests, including: six cardio-pulmonary, three audiometry, six opthalmologic, twelve blood chemistries, together with a hematology survey, urinalysis and 4mm chest X-ray, plus a determination of diabetes and heart trouble potential.

The whole procedure is performed on the spot—just one hour per individual at a cost of only $35—and as you can see does not involve the *practice* of medicine in any way. HSC simply sends to the referring physician computerized test results which help him in his diagnosis and possible treatment.

Unlimited market

Think of the possibilities for a mobile multiphasic screening unit in your area: company employees, union members, school children, and perhaps some unstructured indigent groups such as Indians, rural laborers, migrant farm workers. The need is well established. You will be bringing this vital low-cost preventive medicine to the very doorstep of these people—half of whom will not take themselves to a physician until obvious symptoms appear, which may be too late!

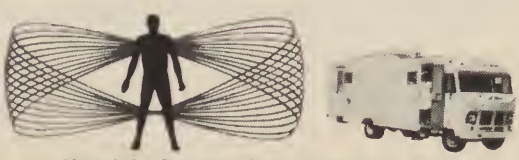
As surely as this service has humanitarian overtones, just as surely are you entitled to a profitable return on your investment. As a medical man, no one is better qualified than *you* to take part in this worthwhile enterprise. We want you to succeed. We *help* you to succeed.

How HSC helps the Licensee

Health Screening Centers, Inc., makes continuously available to investor groups the necessary technological counsel, sales guidance and legal advice. HSC will help you with initial new-business solicitations, advertising, publicity, recruitment of sales and operating personnel. At Denver headquarters, HSC will thoroughly train a staff to operate a mobile or in-plant facility. HSC will assist with all start-up procedures—in short, *everything you need to successfully operate your own health screening center.*

Ground-floor opportunity

Granted, Health Screening Centers, Inc., is a new name—but so is the very concept of multiphasic screening to the layman. Anticipating the growing national awareness of the need for early disease detection, HSC offers this unique opportunity to "get in on the ground floor" of this business of *screening the sick from the well*... an activity that need take very little of your valuable time.



The other rewards

The physician derives deepest satisfaction from his particular contribution to the well-being of the individual, the community, the society. Yet, chances are, your present investments are far afield from your basic desire to solve problems in your own profession. Thus, HSC is proud to offer a new dimension to your profession...an investment in the health of America that reaps financial rewards in direct proportion to the degree it serves.

Send for complete facts

Exclusive licensee areas are now available to individual physicians or groups of doctors. Let us send you complete literature explaining in detail the HSC Licensing Program, how it works and the profit potential for you.

Simply mail your request on your professional letterhead, today, to: Health Screening Centers, Inc., 4101 East Louisiana, Denver, Colorado 80222. Or call collect: (303) 757-7409.

Book Reviews

SYNOPSIS OF EAR, NOSE AND THROAT DISEASES, Robert E. Ryan, MD, Joseph H. Ogura, MD, Hugh F. Biller, MD, and Lindsay L. Pratt, MD; The C. V. Mosby Company, St. Louis, Missouri, 1970.

This book, like others of its kind, is primarily intended for those physicians who wish concise, yet authoritative answers to the many problems encountered in the field of otolaryngology.

It has been rewritten and revised, providing a fresh, up-to-date synopsis of all known otolaryngologic data.

A PHYSICIAN'S LIVING THOUGHTS, Carl Theneve, MD; Philosophical Library Inc., New York, New York, 1970.

This book is a compendium of one physician's thoughts on living. It is broken into various chapters or Pauses, as they are titled, such as Life, Mind, Patient and Physician, Alcohol, and Drugs.

While it contains all the various homilies that one learns over the years, it also represents the thinking of a physician who has actively practiced for more than half a century.

TRIGEMINAL NEURALGIA, Rolf Hassler, MD, and A. Earl Walker, MD; The W. B. Saunders Company, Philadelphia, Pennsylvania, 1970.

This book, co-edited by one of Maryland's distinguished physicians, represents contributions from outstanding men in their field from throughout the world. It was prepared from papers presented at a workshop held in Germany in 1967 and, accordingly, an international group of research workers is represented in its contributors.

While full review of this book would require a detailed report, it is a publication that makes an excellent reference work.

The co-editors are to be highly complimented for the succinct preparation of this material.

painless intramuscular therapy for calcium deficiencies:

Calphosan®

calcium glycerophosphate, calcium lactate

To bring effective calcium therapy to the patient, Calphosan may be administered intramuscularly . . . without pain, inflammatory reactions, induration or sloughing. Injections twice weekly for a series of 5 to 10 injections are recommended.

Average dose per injection: One or two 10 ml. injections of Calphosan each week for the first four or five weeks, and on a when-needed basis thereafter.

Calphosan is a specially processed solution of calcium glycerophosphate and calcium lactate, containing 1% of each, in a physiological solution of sodium chloride. Each 10 ml. contains 50 mg. of calcium glycerophosphate, 50 mg. calcium lactate, with 0.25% phenol as preservative. Available in 10 ml. ampules in boxes of 10s and 100s; 60 ml. multiple-dose vials. Also available as Calphosan with B-12. U. S. Patent No. 2657172.

Contraindication: Hypercalcemia; neoplastic diseases; and fully digitalized patients. Do not use intramuscularly in infants and young children. Before starting therapy, consult complete product literature.

Write for free copy of "Calcium: The Ubiquitous and Essential Element" and for samples.

and how to make them sound legitimate.

Check any of the following tried and true alibis which you would like to have substantiated, and we'll send you our Hotel Hershey brochure with all the ammunition.

☐ I WAS SITTING UP WITH A SICK FRIEND. Sick about that terrible hook he'd developed on the back nine. I helped him drown his sorrows in the Iberian Lounge.

☐ I HAD TO GO TO MY GRANDMOTHER'S FUNERAL. Twenty-three years ago. Then last week we had a ball splashing around the pool at Hotel Hershey.

☐ I WAS ONE OF THE SPEAKERS AT A MEDICAL CONVENTION. All I said was "Fore!", but they all listened. No place like Hershey's 72 holes for meeting AWOL medics.

☐ I WAS CALLED OUT ON A MISSION OF MERCY. My wife was dying to get away for a couple of days to Hotel Hershey, where the food is superb and she doesn't have to fix it.

☐ I HAD THIS IRRESISTIBLE COMPULSION TO HIDE. And what could be more secluded than those bridle paths and wooded riding trails around Hotel Hershey . . . gorgeous at this time of year.

☐ I DIDN'T KNOW IT WAS LOADED. The first time I went to Hotel Hershey, that is. Loaded with all good things of life that make even a few days a luxurious vacation. But man, did I ever come back there fast, once I'd found out!

Yes, please send me your brochure.

HOTEL HERSHEY

Hershey, Pennsylvania 17033

One of the Great Resorts of North America

Baltimore County Medical Association

The June meeting of the Baltimore County Medical Association was held at St. Agnes Hospital on June 17. Greetings were extended to the members by B. Martin Middleton, MD, president of the St. Agnes staff; Emidio Bianco, MD, medical director; and Sister Teresa, administrative assistant. Wilmer K. Gallager, Jr., MD, president, presided during the business meeting. On proper motion, the application for active membership of Margaret Paxson, MD, was approved.

The speaker was Neil Solomon, MD, PhD, Secretary of Health and Mental Hygiene, who spoke on "Delivery of Health Services". His presentation of the concepts developing in the delivery of health services was both timely and informative.

The members of the Association have been invited to the Timonium Race Track in August. Future plans include the annual crab feast to be held in September, the October dinner-meeting to be held at the Sparrows Point Country Club, and the November meeting, an afternoon seminar, to be held at St. Joseph Hospital.

Mrs. Dorothy E. Holman
Executive Secretary

Neil Solomon, MD, PhD (center), Secretary of Health and Mental Hygiene, confers with physicians following the June meeting of the Baltimore County Medical Association. The physicians (left to right) are: Herbert J. Levickas, BCMA secretary; Raymond Bahr, ICU-CCU director at St. Agnes Hospital; Dr. Solomon; Emidio A. Bianco, medical director at St. Agnes; and Wilmer K. Gallager, Jr., BCMA president.

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

May 12, 13, 14, 1971

Civic Center, Baltimore

As space is limited, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty

in trauma

new Orenzyme® Bitabs

One tablet q.i.d.

Trypsin: 100,000 N.F. Units, Chymotrypsin: 8,000 N.F. Units.; equivalent in tryptic activity to 40 mg. of N.F. trypsin

DOUBLE STRENGTH

Proteolytic enzyme therapy specifically indicated for the rapid resolution of inflammation and edema as adjunctive therapy in accidental and surgical trauma.

1 tablet q.i.d. provides recommended therapeutic dose at lower cost.

Description: ORENZYME BITABS offers the therapeutic effects of trypsin in an oral form as adjunctive therapy for the rapid resolution of inflammation and edema. ORENZYME BITABS is convenient to use, promotes patient cooperation and is ideally suited for maintenance therapy following parenteral trypsin.

Indications: When used as adjunctive therapy for the rapid resolution of inflammation and edema, good results have been obtained in:

- ☐ Accidental Trauma
- ☐ Postoperative Tissue Reactions.

Other conventional measures of treatment should be used as indicated. In infection, appropriate anti-infective therapy should be given.

Contraindications: ORENZYME BITABS should not be given to patients with a known sensitivity to trypsin or chymotrypsin.

Precautions: It should be used with caution in patients with abnormality of the blood clotting mechanism such as hemophilia, or with severe hepatic or renal disease. Safe use in pregnancy has not been established.

Adverse Reactions: Adverse reactions with ORENZYME have been reported infrequently. Reports include allergic manifestations (rash, urticaria, itching), gastrointestinal upset and increased speed of dissolution of animal-origin surgical sutures. There have been isolated reports of anaphylactic shock, albuminuria and hematuria. Increased tendency to bleed has also been reported but, in controlled studies, it has been seen with equal incidence in placebo-treated groups. (See Precautions.) It is recommended that if side effects occur medication be discontinued.

Dosage: One tablet q.i.d.

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive — Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfonamides.
Precautions/Adverse Reactions: The usuol precoutions for topical ond systemic sulfonamides should be observed because of the possibility of absorption. Burning, increosed locol discomfort, skin rosh, urticorio or other monifestotions of sulfonamide toxicity ore reosons to discontinue treotment.
Dosage: One opplicotorful or one suppository introvoginolly once or twice daily.
Supplied: Creom—Four-ounce tube with or without opplicotor. Suppositories—Box of 12 with applicotor.

MEDICAL NEWS

Several physicians from the University of Maryland School of Medicine have been appointed assistant professors: **Virginia L. Ault, MD,** pediatrics and psychiatry; **Lindsay W. Black, MD,** biological chemistry; and **Fima N. Lifshitz, MD,** pediatrics. New clinical assistant professors are **Edward L. Sherrer, Jr., MD,** pathology; and **Ronald N. Kornblum, MD,** forensic pathology.

* * *

In February, **Emile F. Holman, MD,** was inducted as a member of The Johns Hopkins Society of Scholars. Dr. Holman is a former chief of surgery at the Pacific Medical Center in San Francisco.

The Society was created in 1967 and inducts former postdoctoral fellows at The Johns Hopkins University who have gained marked distinction in their fields.

* * *

The **Reverend Robert W. Carlson** has been elected to a two-year term as president of the **Maryland Association for Mental Health.** The Reverend Carlson is a former president of the Prince George's County Mental Health Association and rector of the Episcopal Church of the Nativity in Camp Springs.

* * *

Maurice J. Berman, MD, of Baltimore, has moved his downtown office for the practice of general surgery to 18 East Eager Street, Baltimore, Maryland 21202.

* * *

The department of medicine of St. Agnes Hospital has announced the appointment of **Joseph H. Miller, MD,** as Chief, Section of Pulmonary Medicine.

* * *

Donald S. Gann, MD, has been appointed Professor of Biomedical Engineering at The Johns Hopkins University School of Medicine. Dr. Gann has been Director of Biomedical Engineering at Case Western Reserve University School of Medicine since 1967.

His specific research and clinical interest is the control and surgery of the endocrine glands. He hopes to use computers in the care of acutely ill patients.

Dr. Gann, a native of Baltimore, received his MD degree from The Johns Hopkins University School of Medicine in 1956. The following year, he served an internship at Johns Hopkins Hospital in surgery.

* * *

The American Academy of Comprehensive Health Planning has reelected **Eugene H. Guthrie, MD,** chairman of its board of directors. Dr. Guthrie is executive director of the Maryland Comprehensive Health Planning Agency in Baltimore.

* * *

John H. Moxley, III, MD, dean of the University of Maryland School of Medicine, recently accompanied **David Clyde, MD,** professor and director of the Institute of International Medicine, to Lahore, West Pakistan for a site visit from the institute's funding agency, the Public Health Service.

* * *

William J. Hicken, MD, has been appointed Chairman of the Department of Pathology and Director of the Laboratory at St. Agnes Hospital. Sister Alberta, DC, made the announcement.

Dr. Hicken has been Associate Pathologist at St. Agnes since 1965. He will continue to serve as Assistant Professor of Pathology at the University of Maryland School of Medicine.

A native of Baltimore, Dr. Hicken received his BA degree from Loyola College and his MD degree from the University of Maryland School of Medicine. He served an internship and completed his pathology residency, both at the University of Maryland Hospital in Baltimore.

Dr. Hicken

The **Georgetown University School of Medicine** plans to increase its enrollment by 75% in less than five years. The expanded enrollment will be made possible by a project grant of over $8½ million, according to the Rev. R. J. Henle, SJ, president of the university.

The funds from the Department of Health, Education and Welfare are authorized under

the new federal Physicians Augmentation Program. It was set up to help relieve the critical health manpower shortage.

* * *

The Maryland State Department of Health and Mental Hygiene, in cooperation with the College of Engineering of the University of Maryland, held a three-day course on "Visible Emissions Evaluation", June 10-12, 1970.

The course concentrated on the latest methods of evaluating visible emissions through classroom instruction, demonstrations, and actual practice by the students. According to Jean J. Schuenuman, Chief, Division of Air Quality Control, Environmental Health Services, "This course (enabled) the students to gauge the density of smoke with reasonable accuracy and spot possible violators of air quality control regulations."

The course also stressed the legal aspects of visible emissions, including methods of gathering evidence, the taking of statements from witnesses, and how to testify at a trial.

Mrs. Jonathan Williams, of Bethesda, has been elected to serve a second term as chairman of the mental health committee of the Woman's Auxiliary to the American Medical Association. The announcement was made during the auxiliary's 47th annual convention recently held in Chicago.

Mrs. Williams has served as eastern regional mental health chairman for the auxiliary since 1964. Currently, Mrs. Williams is serving a three-year term as a member of the advisory committee to the Montgomery County Mental Health Association.

* * *

R Adams Cowley, MD, chairman of the division of thoracic and cardiovascular surgery at the University of Maryland School of Medicine, recently gave the Nuffield Lecture at the University of Oxford on "The Significance of Liver in Shock". Dr. Cowley was also appointed to the Committee on Component Therapy, Division of Medical Science, National Research Council.

* * *

A 60-minute film entitled **"Seeds of Progress"** is now available on loan from the State Department of Health and Mental Hygiene. The two reels, which can be shown separately without breaking the continuity, describe action taken by two states in tailoring special educational programs to fit the unique needs of the migrant worker. It also stresses that although their labor adds much to the economy of a community, the workers frequently do not receive any community benefits or services.

A tape-recorded interview with migratory laborers in Maryland's Dorchester County is also available, and provides an interesting supplement to the film.

Appropriate for general audiences from junior high school through adult levels, the film may be borrowed without charge in the state from the Film Services, Maryland State Department of Health and Mental Hygiene, 301 West Preston St., Baltimore. Phone 383-3010, extension 8516.

* * *

Wilmer K. Gallager, Jr., MD, of Baltimore, has moved his practice to the St. Agnes Medical Center, Suite 300, 3455 Wilkens Avenue, Baltimore, Maryland 21229. Dr. Gallager's specialty is internal medicine.

The trustees of the Caleb Fiske Fund of the Rhode Island Medical Society have announced the subjects for the 1970 essay contest. The Fund sponsors the oldest medical prize essay competition in the United States. The two subjects are "The Crisis with Hallucinogenic Drugs—Possible Solutions" and "Human Cell Cultures in the Diagnosis of Disease".

A cash prize of $500 will be awarded for the best paper on either subject. Essays must be submitted by December 15, 1970. They must be typed, double spaced, and may not exceed 10,000 words.

For additional information, write: Secretary, Caleb Fiske Fund, Rhode Island Medical Society, 106 Francis St., Providence, Rhode Island 02903.

Ivan L. Bennett, Jr., MD,

vice-president for health affairs at New York University and director of its Medical Center since January 1969, has been appointed dean of the New York University School of Medicine and of the Postgraduate Medical School. This is the first time that the deanship of the schools and the directorship of the Center have been held by one person.

Dr. Bennett was an assistant pathologist at Johns Hopkins Hospital in Baltimore and an assistant in pathology at the university from 1949 to 1950. After holding several other positions, Dr. Bennett returned to Hopkins in 1954 as associate professor of medicine. He became full professor in 1957 and was named Baxley Professor of Pathology and director of the department the following year.

Dr. Bennett is a past president of The Johns Hopkins Medical Society.

* * *

James A. Lyon, MD, professor of radiology at the University of Maryland School of Medicine, recently presented a paper at the annual meeting of the Eastern Radiological Society in Portugal.

* * *

Miss Patricia L. Kienker has been awarded first place for her scientific essay entitled "Cardiac Pacemakers". A junior student at St. Agnes Hospital's School of Radiologic Technology, Miss Kienker received the award at the 11th annual state meeting of the Maryland Society of Radiologic Technologists held in Gaithersburg.

Miss Kienker competed against radiology students from other approved AMA schools in the Maryland region.

Results of the first certifying examination in the new medical specialty of family practice are in. Of the 2,078 physicians who took the exam, 81.6% passed it successfully. The exam was offered nationally on February 28-March 1, 1970.

A second examination will be given in February 1971. Those physicians who pass will be included in the charter membership group of the Board of Family Practice.

* * *

In February 1970, the **Wilmer Clinic** of **The Johns Hopkins Hospital** conducted a full day of mass screening for eye problems, with special emphasis on histoplasmosis. Participating in the study were most of the Wilmer resident staff, many full-time physicians, 32 volunteer nurses, several physicians from the School of Hygiene and Public Health, and 150 volunteers from the Walkersville Lions Club and community. The ophthalmology and epidemiology teams screened 1,200 people from Walkersville—70% of the town's population.

Each person tested received a skin sensitivity test and a routine eye examination. According to Ron Smith, a member of the Wilmer house staff, "We wanted to determine the incidence of histoplasmosis of the eye in an isolated population where the disease is known to occur."

Results of the screening tests will be keypunched for computer analysis. When the analysis is completed, ophthalmologists will have more information about the relationship between histoplasmosis and eye disease.

Several Maryland physicians recently participated in the 1970 meeting of the University of Maryland Surgical Society. Participants included **John H. Moxley, III, MD,** Dean of the University of Maryland School of Medicine, **Robert W. Buxton, MD, Marvin Cornblath, MD, Arthur L. Haskins, MD, Theodore W. Woodward, MD,** and **George H. Yeager, MD.** Participating in the scientific sessions, with **James G. Arnold, MD,** as moderator, were **Edward W. Campbell, MD, David S. McHold, MD, Raymond M. Cunningham, MD, Harry C. Hull, MD,** and **Neil A. Robinson, MD.** Sessions moderated by **William B. Long, MD,** included **Sufah Attar, MD, R Adams Cowley, MD, Philip J. Ferris, MD, Robert M. N. Crosby, MD,** and **Arlie R. Mansberger, Jr., MD.**

* * *

The recipient of the first annual Alexander J. Schaffer Award for excellence in clinical teaching is **William H. Zinkham, MD,** of Baltimore. Dr. Zinkham, a 1947 graduate of The Johns Hopkins University School of Medicine, is presently Associate Professor of Pediatrics at The Johns Hopkins Children's Center.

The award is named for **Alexander J. Schaffer, MD,** Associate Professor Emeritus of Pediatrics at Hopkins. Dr. Schaffer, who has been associated with Hopkins for over 40 years, was Director of The Johns Hopkins Community Pediatrics Program.

The award was originated by the department of pediatrics house staff at the Children's Medical and Surgical Center.

* * *

Marcus W. Moore, Sr., MD, of Baltimore, was recently reappointed by Governor Mandel to the Advisory Council on Hospital Construction, and will serve a three-year term.

A new appointment to the Air Quality Advisory Council, to fill the remainder of a five-year term from June 1, 1967, is **Henry Koellein, Jr.,** of Baltimore. Reappointed to the Council are **Donald W. Pritchard, MD,** of Severna Park, and **John G. Lentz, MD,** of Columbia.

Appointed to serve five-year terms on the Advisory Board on Hospital Licensing are **Paul O. Becker** and **Victor H. Morgenroth, Jr.,** both of Baltimore.

Arthur E. Cocco, MD, of Baltimore, has been appointed to serve the remainder of a one-year term on the Board of Examiners of Nursing Home Administrators.

Reappointed to the Maryland Commission on Medical Discipline, **Elmer G. Linhardt, MD,** of Annapolis, will serve a three-year term.

Russell H. Morgan, MD, of Baltimore, has been reappointed for a four-year term on the Radiation Control Advisory Board.

* * *

Edmund G. Beacham, MD, has been elected president of the Baltimore Area Council on Alcoholism. **Harry F. Klinefelter, MD,** was elected to share the office of vice-president with **Robert Hammen.**

Among the new members elected to the Advisory Board are **Robert E. Farber, MD,** and **Addison W. Pope, MD.**

* * *

Some "do's" and "don'ts" for lifeguards are illustrated in **"No Second Chance",** a 20-minute color film available from the State Department of Health and Mental Hygiene.

In the film, lifeguards at public and private swimming pools are urged to learn mouth-to-mouth and mouth-to-nose methods of resuscitation, and learn to recognize dangerous situations before they develop into tragic accidents. The film also includes other suggested preventive measures, and important safety reminders for pool managers and owners.

Recommended especially for training lifeguards and camp counselors, the film may be borrowed without charge from the Film Services, Maryland State Department of Health and Mental Hygiene, 301 West Preston St., Baltimore. Phone 383-3010, ext. 8516.

* * *

Raymond A. Sjodin, MD, professor of biophysics at the University of Maryland School of Medicine, served as local arrangements chairman for the annual Biophysical Society, which met in Baltimore in February.

* * *

Neil Solomon, MD, PhD, Secretary of Health and Mental Hygiene, in an address to a bipartisan group of congressional wives and staff members, recently discussed a proposal for a **National Health Insurance Program.**

According to Dr. Solomon, this would be a voluntary health payment program and would allow both patient and physician the right of choice of participation. For those who participate in the program, he envisions payment for total health care, including hospitalization. He likened this plan to the guarantee of universal free education for all Americans.

* * *

W. Hamilton Whiteford has been elected president of **Hospital Cost Analysis Service, Inc.** The service is an independent, nonprofit agency that studies and evaluates hospital costs in Maryland.

A member of the board at Maryland General Hospital, Mr. Whiteford succeeds Dr. Albin O. Kuhn.

* * *

James A. Dorsey has been appointed executive assistant to **Neil Solomon, MD, PhD,** Secretary of Health and Mental Hygiene. Mr. Dorsey will act as liaison officer to the executive staff of the department and all agencies within the department.

Mr. Dorsey was previously associated with Sinai Hospital as an administrative staff member.

* * *

Salvatore Raiti, MD, has been appointed associate professor of pediatrics at the University of Maryland School of Medicine. **Lois A. Young, MD,** has been named associate professor of ophthalmology.

* * *

Two Maryland men, **Seymour Leon,** and **Robert W. Gibson, MD,** recently received the highest national public relations award—**The Silver Anvil.** Governor Mandel made the presentation.

Mr. Leon is Director of Community Relations & Development, and Dr. Gibson is Medical Director at the Sheppard and Enoch Pratt Hospital in Towson. The hospital is only the second Maryland winner in the 26-year history of the award.

* * *

Seymour Leon (left) and Robert W. Gibson, MD (middle), receive the Silver Anvil public relations award from Governor Mandel. Mr. Leon is Director of Community Relations and Development, and Dr. Gibson is Medical Director at Sheppard and Enoch Pratt Hospital in Towson.

A new "crisis clinic" for the emergency treatment of the mentally ill has been established at **Sheppard and Enoch Pratt Hospital** in Towson. The clinic will examine and treat persons who attempt suicide, those with acute schizophrenia, and any other severely disturbed persons in the northern Baltimore County area.

Samuel Blumenfeld, MD, clinic director, expects 40 to 50 patients a week. Staffed by 15 psychiatric residents and a full-time social worker, the clinic will offer patients daily short-term consultation and such services as vocational and marital counseling.

* * *

Herbert B. Copeland, MD, Nathan B. Hyman, MD, Albert B. Shackman, MD, Nathan Stofberg, MD, Martin J. Birnbaum, MD, and **Larry A. Snyder, MD,** have announced the association of **Samuel Andelman, MD,** in the private practice of diagnostic radiology.

* * *

Appointed instructor at the University of Maryland School of Medicine are **Henry I. Babitt, MD,** medicine; **Earl Clayton Davis, Jr., MD,** otolaryngology; **Robert F. DeBusk, MD,** medicine; **Rose Marlene Gieske,** nursing in neurology; **Ronald E. Gillilan, MD,** medicine; **Michael Gospe, MD,** medicine; **John Hammann, MD,** medicine; **Karl E. Hammermeister, MD,** medicine; **Robert A. Hartley, MD,** medicine; **Vilis E. Kilpe, MD,** medicine; **Noel D. List, MD,** epidemiology; **Prasarn Nilprabhassorn, MD,** radiology; and **Linda L. Wadian,** nursing in neurology.

* * *

Maureen Henderson, MD, of Baltimore, has received a grant from the Research Project Fund of the Southern Medical Association. Professor of Preventive Medicine at the University of Maryland School of Medicine, Dr. Henderson received the grant for her research project on the epidemiologic study of mongolism.

* * *

An article on breast cancer treatment by a Baltimore physician, **T. Brannon Hubbard, Jr., MD,** appears in the May 18 issue of *Modern Medicine.* The article is entitled "Should biopsy of the 'normal' breast be done in the patient with proved unilateral breast cancer?"

Dr. Hubbard is associate professor of surgery at the University of Maryland School of Medicine.

* * *

Joseph F. McManus, Executive Director of the Federation of American Societies for Experimental Biology in Bethesda, has been named visiting professor of pathology at the University of Alabama Medical Center. Dr. McManus, former chairman of the UA Medical Center's department of pathology, is an international authority on histochemistry and its application to renal disease.

* * *

John E. Adams, MD, has been appointed Associate Director of the Division of Manpower and Training Programs of the National Institute of Mental Health.

According to Stanley F. Yolles, MD, Director of the Institute, Dr. Adams will head its program planning and evaluation functions.

* * *

The Ritchie Unit of the Rosewood State Hospital, a new facility renovated to accommodate the mentally retarded, was recently opened on the grounds of the Mt. Wilson State Hospital in Pikesville. Formerly used by persons with respiratory diseases, the Ritchie Building has a capacity for 100 patients.

* * *

James E. Carson, MD, Commissioner of Mental Hygiene, has announced the initiation of a program to correct a long-standing problem in care and treatment of Baltimore city's mentally ill. The new program provides improved transportation of patients in the city to Spring Grove, Crownsville, and Springfield State Hospitals. It also offers an appropriate health setting for transportation of the ill, with an alcoholism counselor or a psychiatrically trained nurse in attendance.

* * *

The National Society for the Prevention of Blindness will allocate a substantial portion of its research funds to provide prompt support to promising investors who have not received extensive financial support for research in the past. Acceptable projects are those which may contribute to basic understanding of eye function and disease, or that may improve diagnosis and treatment, or that may be directed toward the prevention of an eye disease.

Grants are made for a one-year period. The maximum period of support for research is two years. Application forms and further information may be obtained by writing to the Committee on Basic and Clinical Research, National Society for the Prevention of Blindness, Inc., 79 Madison Avenue, New York, New York 10016.

* * *

Simon H. deBruin, MD, has been named research associate in biochemistry and **David Blake, MD,** a research associate in anesthesiology at the University of Maryland School of Medicine.

* * *

THE MONTH IN WASHINGTON

An American Medical Association proposal for peer review for the medicare and medicaid programs drew favorable reactions from members of the Senate Finance Committee.

Peer review was one part of a three-point program which Gerald D. Dorman, MD, the outgoing president of the AMA, offered in testimony at a Senate Finance Committee hearing on medicare and medicaid.

Dr. Dorman and Dr. Julius W. Hill, president of the National Medical Association, testified together. They jointly urged Congress, on behalf of their organizations, to replace medicaid with a national health insurance program subsidized by the federal government.

The AMA health insurance proposal, which was initially approved by the AMA House of Delegates in 1968, is similar to the plan President Nixon included recently in his proposed revised new national welfare program. He said he would send such legislation to Congress early next year.

Congress is not expected to take up proposals for national health insurance this year. But reaction to the peer review proposal was highly encouraging, and prospects for Congressional approval this year appear good. Sen. Wallace F. Bennett (R., Utah), a finance committee member, directed the committee's staff to work with AMA staff representatives in drafting such legislation as an amendment to a bill revising medicare and medicaid.

The president of the AMA, with 223,000 members, and the predominantly Negro NMA, gave assurances at the finance committee hearing of the medical profession's cooperation in solving the nation's health care problems. It was the first time that spokesmen for the two leading medical associations had testified together before a Congressional committee.

According to Dr. Dorman, "the medical profession hopes to see the nation pursue" the three-point program in efforts to provide quality health care for everyone as economically as possible.

Dr. Hill said the insurance plan would work better than medicaid in the ghettos. He also defended physicians against accusations that they have been profiteering under medicaid and medicare.

The first two parts of the AMA program comprised the association's "medicredit" health insurance plan. The third, peer review, "is a way to assure both scientific quality and economic reasonableness in the medical and health care people get," Dr. Dorman said.

"Our first program would meet the problems of the Title XIX medicaid program," Dr. Dorman said. "Under our plan, each low income person or family would receive a certificate for the purchase of a qualified and comprehensive health insurance plan. The protection would be theirs without expense or contribution since the cost of the program would be borne entirely by the federal government.

"The second offers tax credits on a sliding scale based on the tax liability of a family, for the purchase of qualified health benefits coverage. For those with moderate or higher incomes, the program would provide cash incentives through income tax credits to encourage them to protect themselves against major health care costs.

"The third part of our program calls for a structured peer review mechanism to insure high quality of care and to prevent abuses of the medicare and medicaid programs."

Dr. Dorman noted that the committee's staff, in a report last February on medicare-medicaid, suggested that organized medicine regulate itself.

"We agree, and propose a program providing for professional review of matters bearing on reasonableness of charges for, need for, and the quality of services rendered by, the provider of medical or other health services," he said.

In a speech before the Senate, Bennett said there is deep concern over the high costs of medicare and medicaid. He compli-

mented the AMA on advancing peer review as a means of curbing these costs. He said:

"I believe the American people are justifiably concerned over the tremendous costs of health care. Much of that concern, it seems to me, is a product of a very real feeling that we are not getting what we are paying for. I believe, equally, that much of the apprehension, anxiety, and suspicion now prevalent—for better or worse—with respect to those responsible for health care would disappear if professional standards review organizations were established and functioned effectively. It seems to me that the American people are entitled to know that American medicine shares their concern—and more importantly—proposes to do something substantial about it through means of professional standards review organizations . . .

"I believe that physicians, properly organized and with a proper mandate, are capable of conducting an ongoing effective review program which would eliminate much of the present criticism of the profession and help enhance their stature as honorable men in an honorable vocation willing to undertake necessary and broad responsibility for overseeing professional functions. If medicine accepts this role and fulfills its responsibility, then the government would not need to devote its energies and resources to this area of concern. Make no mistake: The direction of the House-passed social security bill is toward more—not less—review of the need for, and quality of, health care. I believe my amendment would provide the necessary means by which organized medicine could assume responsibility for that review."

Bennett said that under his amendment review groups would have responsibility for reviewing "the totality of care provided patients—including all institutional care". That responsibility, he said, would be lodged "wherever possible and wherever feasible", at the local community level. He said:

"Local emphasis is necessary because the practice of medicine may vary, within reasonable limits, from area to area, and local review assures greater familiarity with the physicians involved and ready access to necessary data. Priority should be given to arrangements with local medical societies—of suitable size—which are willing and capable of undertaking comprehensive professional standards review . . .

"Under the amendment, the Secretary (of Health, Education and Welfare) could use state or local health departments or employ other suitable means of undertaking professional standards review only where the medical societies were unwilling or unable to do the necessary work, or where their efforts were only pro forma or token. Let me emphasize as strongly as possible that the thrust of this proposal is to have physicians, as a group, evaluate physicians and the services they provide and order as individuals."

Bennett said that the review committees should determine that only medically necessary services are provided by physicians, hospitals, nursing homes and pharmacies, and that these services meet proper professional standards.

Disciplinary measures, he said, would be in proportion to the offense and could include: 1) monetary penalties, 2) suspension from federal programs, 3) exclusion from federal programs, 4) civil or criminal prosecution, and 5) steps leading to the suspension or revocation of professional licensure.

Dr. Hill directed his testimony before the finance committee mainly to medical care of Negroes and other poor people, particularly in ghettos. He took issue with the committee staff report which, he said, "by implication attacked the very physicians working closest to the poor and treating them". He said restrictions on physicians' fees, as advocated in the report, would make more acute the already critical shortage of physicians in ghettos.

"To those who read the entire report, there were a number of very complimentary things said about all physicians," Dr. Hill said. "But the primary message, the one seized upon by the press and broadcast across the country, appeared to be that any doctor earning a substantial amount of money from medicare-medicaid was somehow cheating both the government and his patients.

"It was bitterly ironic. To work 60 and more hours a week in the ghetto, and to be fairly paid, was suddenly prima facie evidence of wrongdoing.

"The report was also interpreted so that the blame for the rising cost of medicare-medicaid was directed at the physician—and particularly those caring for the poor.

"Therefore, we of the National Medical Association take strong exception. The implications and accusations of that report were grossly unfair. It is difficult enough to get physicians to practice among the poor . . . If these men, professionals committed to providing care, are to be subjected to irresponsible accusations for the size and success of their ghetto practices, it will very soon be impossible to find a doctor among the American poor."

The associations showed the senators a brief movie of physicians practicing in a Chicago ghetto health center and in an Appalachian community clinic.

You Can't Blame a Girl...

(when her husband's at fault)

Flagyl® brand of metronidazole

Cures Trichomoniasis in Both Women and Men

About half of all husbands of infected women harbor *Trichomonas vaginalis.**

Few of these men have symptoms. Even so, all are capable of perpetuating the infection and rendering treatment of a woman alone futile.

Only a systemically active medication like Flagyl is capable of reaching the hidden reservoirs of infection in the genitourinary tracts of both men and women.

Only Flagyl has been able to achieve rates of cure consistently above 90 per cent and often up to 100 per cent in trichomonal infections in both men and women.

Indications: For the treatment of trichomoniasis in both male and female patients and the sexual partners of patients with a recurrence of the infection provided trichomonads have been demonstrated by wet smear or culture.

Contraindications: Evidence of or a history of blood dyscrasia, active organic disease of the central nervous system and the first trimester of pregnancy.

Warnings: Use with discretion during the second and third trimesters of pregnancy and restrict to patients not cured by topical measures. Flagyl (metronidazole) is secreted in the breast milk of nursing mothers. It is not known whether this can be injurious to the newborn.

Precautions: Mild leukopenia has been reported during Flagyl use; total and differential leukocyte counts are recommended before and after treatment with the drug, especially if a second course is necessary. Avoid alcoholic beverages during Flagyl therapy because abdominal cramps, vomiting and flushing may occur. Discontinue Flagyl promptly if abnormal neurologic signs occur. There is no accepted proof that Flagyl is effective against other organisms and it should not be used in the treatment of other conditions. Exacerbation of moniliasis may occur.

Adverse Reactions: Nausea, headache, anorexia, vomiting, diarrhea, epigastric distress, abdominal cramping, constipation, a metallic, sharp and unpleasant taste, furry or sore tongue, glossitis and stomatitis possibly associated with a sudden overgrowth of *Monilia,* exacerbation of vaginal moniliasis, an occasional reversible moderate leukopenia, dizziness, vertigo, drowsiness, incoordination and ataxia, numbness or paresthesia of an extremity, fleeting joint pains, confusion, irritability, depression, insomnia, mild erythematous eruptions, "weakness," urticaria, flushing, dryness of the mouth, vagina or vulva, vaginal burning, pruritus, dysuria, cystitis, a sense of pelvic pressure, dyspareunia, fever, polyuria, incontinence, decrease of libido, nasal congestion, proctitis, pyuria and darkened urine have occurred in patients receiving the drug. Patients receiving Flagyl may experience abdominal distress, nausea, vomiting or headache if alcoholic beverages are consumed. The taste of alcoholic beverages may also be modified.

Dosage and Administration: *In the Female.* One 250-mg. tablet orally three times daily for ten days. Courses may be repeated if required in especially stubborn cases; in such patients an interval of four to six weeks between courses and total and differential leukocyte counts before, during and after treatment are recommended. Vaginal inserts of 500 mg. are available for use, particularly in stubborn cases. *When the vaginal inserts are used* one 500-mg. insert is placed high in the vaginal vault each day for ten days and the oral dosage is reduced to two 250-mg. tablets daily during the ten-day course of treatment. Do not use the vaginal inserts as the sole form of therapy. *In the Male.* Prescribe Flagyl only when trichomonads are demonstrated in the urogenital tract, one 250-mg. tablet two times daily for ten days. Flagyl should be taken by both partners over the same ten-day period when it is prescribed for the male in conjunction with the treatment of his female partner.

Dosage Forms: Oral tablets . . . 250 mg.
Vaginal inserts . . 500 mg.

Research in the Service of Medicine

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Ladies Activities for the Semiannual Meeting

The Faculty's Program and Planning Committee has met twice since April. In addition, I have journeyed to Hershey, Pennsylvania to help make arrangements for the Semiannual Meeting on September 10, 11, and 12, 1970. The members of the committee are Doctors Arlie R. Mansberger, Jr. (chairman), John B. DeHoff, William L. Stewart, Albert M. Antlitz, Henry A. Briele, Mrs. Genevieve Ritchie from the Faculty staff, and myself.

My responsibility to the committee is centered around planning activities for the ladies and helping with the social functions. We are fortunate, as doctors' wives, to be included in a portion of our husbands' schedule, and our own plans will revolve around their activities and will include everyone.

Thursday evening will be Monte Carlo Night again this year. This event was enjoyed by many last year and is included this year by request.

Friday promises to be a full day. Our Semiannual Meeting is scheduled to start with registration at 9:00 AM, followed by the business meeting at 9:30 AM.

At this point, I want to emphasize that our auxiliary is only as strong as the weakest member. The business of the auxiliary is the business of all doctors' wives because it concerns our husbands and their colleagues. The only way we can grow and continue to contribute to community programs is through the continued support of the individual wife and the encouragement of the component medical societies. We are essentially a service organization dedicated to volunteer work and promotion of fellowship between physician families. Plan to attend our meeting and see where the action is—and where it could be!

Following our meeting, we have been invited to join our husbands for the scientific program at 11:00 AM. Plans are still incomplete as of this writing. The program promises to be an interesting and timely panel discussion on ecology of the Chesapeake Bay and marshes, and pollution. Anyone interested in hunting, fishing, and water sports will find this program especially informative.

The M.P.A.C. Luncheon is scheduled for 12:30 PM. Since this is an election year, the speaker should have some informative political remarks to make.

Those interested in golf will have to forego the luncheon since tee off time is scheduled for 1:00 PM, with mixed foursomes to start at 2:00 PM. In order to have everything go smoothly, the ladies and the mixed foursomes will play the nine-hole course at the hotel. This will enable everyone to return to the hotel in time to relax and get ready for the cocktail party, to be followed by dinner and entertainment by the well-known entertainer, Mark Russell.

Also scheduled for Friday afternoon is a tour of the Hershey Medical Center. This is being repeated by request and will include a tour of the hospital portion of the center, which was still under construction last year.

Those interested in a conducted tour of the rose gardens at the hotel will get together on Saturday morning. In the event of rain, another program will be substituted. The manager of the hotel is hoping to include a look at the Hershey Boys School as part of the tour of Hershey and the Hershey Museum scheduled for Saturday afternoon. We might also get to visit one of the dormitory units located on the farms of Hershey that house the students of the school.

Saturday evening will start with a cocktail party and will be followed by a dinner-dance. The auxiliary has been asked to provide entertainment again, and Mrs. Richard Bauer is in charge of the intermission show. Talent will be drawn from our own ranks and the outlook promises another fun evening again this year.

If anyone is interested in tournament bridge, let us know when you register. A tennis tournament is not practical because of the limited facilities. If you like, however, bring your own racket and play for fun.

A different feature this year is the hobby corner,

to be located in the lobby hall behind the Med-Chi registration desk. If you have a hobby, please bring a sample for display. It will be interesting to see the various hobbies enjoyed by the doctors and their wives. This could be a springboard for new friendships through mutual spare time endeavors. This is for husbands *and* wives—don't be bashful! Let's all join in the hobby fun and compare notes. Help make this the biggest, best, and most fun Semi-annual Meeting ever! See you there.

Controversy over Semantics

Dear Sir:

As the Director of the Maryland Poison Information Center, and a member of the Medical and Chirurgical Faculty of Maryland, I had occasion to review the May 1970 *Maryland State Medical Journal.* The summary of reported poisonings in Baltimore City 1967-1968 was rather impressive in that it noted the city had 3,775 poisonings in 1968. [Reported by the Baltimore City Health Department on page 101.] Since we keep statistics not only for the city, but all of Maryland, I want to note that in general these reports were not poisonings, but only ingestions. (Ingestion includes all products that have been taken orally, and were either not intended for internal use—household products, plants, etc.—or not intended for use for the individual who had taken them, and that these products were taken in sub-toxic amounts.

I feel that I should point this out since stating information to the medical profession which is known to be faulty may be questioned.

Mary S. Furth, MD, Director
Maryland Poison Information Center
Baltimore City Hospitals

Dear Sir:

Thank you for your note regarding the poison statistics reported in the May issue.

The figures which were used in the report are derived from a poison ledger system developed in 1967 through the joint efforts of the City Health Department's Bureau of Food Control and Dr. Emily Seidel, Director of the Maryland Poison Information Center, which is now under the supervision of Dr. Furth. This was the first system and the first real attempt to get statistical information about the important area of poisonings. Each hospital or clinic was visited individually and asked to report all instances of patients reporting to the emergency room as a poisoning. The information was indicated on a form prepared jointly by the Health Department and the Poison Information Center. These are the figures which have been used since this new program was started.

As I understand it, Dr. Furth is concerned about not using the word "ingestion". However, the hospitals were asked to report cases of "poisonings". The poison reporting ledger system is still being maintained in its present state since it does provide useful information on poisonings. No doubt the Maryland Poison Prevention Committee will eventually come up with a satisfactory solution that will be agreeable to all its members.

We are all deeply committed to preventive medicine and this information is a useful tool.

Joseph Gordon, Director
Bureau of Health Information
Baltimore City Health Department

A Psychiatrist Speaks Out

Dear Sir:

The lesson to be learned from the recent Wayne Young case in Baltimore was clearly stated in the turbulent trial of Jack Ruby. It is that the psychiatrists do not belong in the courtroom in such cases. Four qualified psychiatrists found the defendant to be "insane" and four others, as equally qualified, declared the same individual to be "sane". It has long been acknowledged that with a "battle of the experts" the question of "sanity" becomes an impossible issue.

The jury should not be made responsible for deciding the defendant's mental state at the time of the criminal act. All that a jury can competently answer is whether the defendant has committed the criminal act as charged.

Whenever the question of mental competence to stand trial arises, the court can arrange for a panel of experts to determine the defendant's *present* mental status. Does he understand the nature of the charge, and is he mentally competent to participate in his own defense? If the defendant is found guilty, the same panel can advise the judge on an out of court basis in regard to the effectiveness of treatment. Psychiatrists should refuse to testify in court in regard to what was in the defendant's "mind" at the time of the offense. Also, "Insanity" as a defense is too complex and too technical for a jury to determine. Only when psychiatrists are barred from the courtroom, or refuse to testify except on an out of court basis, can the perplexing problems involved in the evaluation of the insanity plea be effectively solved.

Jacob H. Conn, MD
Former Acting Chief Medical Officer to the Supreme Bench of Baltimore

Frederick County Medical Society

Ernest A. Dettbarn, MD
Journal Representative

"Because of his enthusiasm and steadfast efforts, a blood donor program was established in Frederick County in conjunction with the Red Cross . . ."

James A. Grove, former Frederick postmaster, was presented the society's "Appreciation Award" at a dinner-meeting in May. The certificate, sponsored by the Medical and Chirurgical Faculty, was presented by the society president, A. M. Powell, Jr., MD.

Mr. Grove, who served as postmaster from 1950 until 1968, was chairman of the American Legion blood program from 1946 to 1961, and served as chairman of the county Easter Seal fund drive in 1960 and 1961. Through his inspiration, leadership, and devotion to his volunteer work, a countywide blood bank program was established in conjunction with the Red Cross in 1961. Mr. Grove has served as chairman since its inception.

In presenting the award, Dr. Powell expressed not only the gratitude of the members and their wives and guests present, but also of all citizens who have personally benefited from the services of the blood bank. Tribute was also given to Mrs. Grove for her patience and understanding during the many hours given by her husband in volunteer services.

"The Third Parent" was the topic of the guest speaker for the evening. Duncan Wallace, MD, child psychiatrist in the Washington, D.C. area, gave an enlightening and most informative talk on the effects of television (the third parent) on children. Citing alarming statistics, he discussed the impact of violence on the lives of children who are exposed to television violence for more hours than they are in the school classroom. His comments were most thought-provoking for all present.

A.M. Powell, MD (left), president of the Frederick County Medical Society, presents the certificate of appreciation to Mr. James A. Grove for his efforts in the county's Blood Bank program.

sportsmedicine

The following papers were presented at the Third Annual Medical Aspects of Sports Seminar held in December 1969 at Catonsville Community College in Catonsville, Maryland. The Seminar was sponsored by the Medical and Chirurgical Faculty of the State of Maryland and the Division of Health, Physical Education and Recreation of Catonsville Community College.

Reflections on the 1968 Olympics Conducted at High Altitude

The prime reason for our success at the 1968 Olympic Games was our early formation and training at Lake Tahoe.

THOMAS F. WADDELL, MD
Montefiore Hospital
Bronx, New York

My reflections on the 1968 Olympic Games could be a very diffuse subject. Now, the games themselves seem to have been just a fleeting experience compared to the several months I spent at the high altitude training camp at South Lake Tahoe. It was this training period, in fact, that made the Mexico City Olympics the most astounding ever in terms of performance. Nineteen world records were tied or broken in track and field alone and almost every Olympic record fell at Mexico City.

The questions that most people asked following the Mexico City Olympics were, "What happened down there? Why did everyone do so well?" The answers are numerous, few of them are based on fact, and most are speculative at best. I have my own list of possible answers to those performances and I'll be the first to admit that my priorities in terms of importance are quite subjective and are not the result of any formal study.

I did have the advantage of following the team in a dual role, ie, as a competitor and as one of the purveyors of the health service to the team, from the training period to the games.

The prime reason for the success of the team was its early formation at South Lake Tahoe. This happens to be a controversial subject because the official date for formal team workouts is to be one month before the games. This team met on July 17, approximately three months prior to the games. Ostensibly, each athlete received a specific invitation to participate in a medical testing program. I don't think that any American team has ever undergone such a concentrated effort prior to the Olympic Games.

The 400 participating athletes lived in trailers on a mountaintop next to an abandoned ski slope. While they had a training table, there were liberal hours for eating. They had a physical examination room, a weight training room, a universal weight machine, and sick call available to them.

Few athletes had cars and it was 20 miles to the nearest casino (across the state line in Nevada). This discouraged younger team members such as Casey Carrigan and Larry James, even though there were no curfews imposed.

The athletes were permitted to seek their own training levels. Coaches were available, but very few had anything to teach the youngsters who had already reached world class in their events. The lack of rapport between athletes and coaches was understandable since athletes had no voice in the coaches' selection.

Yet, there was an easy atmosphere that was conducive to training. I was stimulated by the comraderie and friendly competition. There was an honest desire among the athletes, with very few exceptions, to help each other improve and to push for better performances.

A video-tape machine was available for the last few weeks before we left for Denver. This device should have been there from the first day. By seeing themselves in slow motion, the athletes appreciated more fully the verbal criticism they sometimes received from the coaches. I would strongly advocate the use of this training device as a means of pointing out deficiencies.

Another factor in the success formula was the simulation of conditions which would be encountered in Mexico City. We had an identical track and runways, and we practiced at an altitude approximately 20 feet higher than Mexico City. In fact, there was even an attempt to simulate the water conditions. We drank from a spring-fed water supply which had its origin in the mountains above the camp. Apparently it was a popular animal watering area as well. An epidemic of diarrhea occurred in the camp and this was traced to a high coliform count in the drinking water.

There were curious phenomena associated with training at 7,400 feet. When I arrived at this altitude, I did not feel any adverse effects for about three days, other than some shortness of breath on exertion.

From the fourth day to about the third week, however, there was a period of easy fatigue and a sensation of heaviness. It took great effort to move and I had a constant feeling of weariness after a race.

After three weeks there was a gradual return of normal respiration and a feeling of well being. The noticeable fatigue was no longer reflected in different responses, but was shown by general weakness and periodic leg cramps. I felt "high" during this acclimatization period. But vital capacity was increased, probably as a result of a diminution of the functional reserve volume.

I did not see any high altitude pulmonary edema at Tahoe, though this is usually reported at altitudes higher than 10,000 feet. Nor did I see any sickle cell crisis in any Negro athletes, either at Lake Tahoe or in Mexico City. No sickle cell screening was done, to my knowledge, but statistically there should have been several athletes out of the 1,000 or so competitors with sickle cell traits.

I did see one case of diaphragmatic spasm, secondary to anoxia, in Jim Kemp immediately after he ran a world-record 300 meters. This problem cleared up immediately but was frightening to watch.

Another highly publicized factor in the history of the 1968 Olympics was the use of drugs. There was widespread use of analgesics, anti-inflammatory drugs, anabolic steroids, cortisone, and ACTH, and the most gross abuse of vitamins and minerals that I have ever encountered. Many trainers and several coaches were among the most outspoken proponents for the use of these drugs. However, I think the medical profession should conduct controlled studies on the effect of these drugs in healthy young people.

I saw severe acne result from the anabolic steroids. And I saw diarrhea develop from inorganic phosphates which were passed out by a group of name coaches who supposedly had developed the compound. I also saw athletes eating up to 10,000 mg of vitamin C in a single day, while others were getting shots of 1,000 mg of vitamin B_{12} an hour before their competition. There are a great many myths associated with vitamins and I think it is fortunate that no serious effects have been noted to date. But the general lack of danger is a very unscientific reason for their injudicious administration, particularly when the beneficial effects have not been proven.

I should mention that we had the services of Dr. Carl Stough, of the Carl Stough Breathing Institute. He has developed a method of diaphragmatic breathing, which up to now has been significantly successful in treating persons with chronic lung disease. Diaphagmatic breathing is efficient, but is not an easy thing to do when you are keyed up during a race. All of us have seen athletes straining while running and have realized that they were not getting the most efficient air exchange. Dr. Stough studied the Yale team two years ago and volunteered to work with us at Tahoe. Most of us who took advantage of his classes began to feel better during workouts and this may have also made a difference in the performances. I think the method should be employed by coaches for all strenuous events, even at sea level.

There were other reasons for the athletes' success, but eventually it always depended on the athlete himself. I think, though, that the early formation of the team, the video tape, and the simulation of conditions at Tahoe, all aided the final performance.

Heat and cold are the two most generally accepted physical measures used in modern athletic rehabilitation. However, therapeutic exercises, massage, splinting, and compression bandaging are becoming increasingly more important in the restoration of the injured athlete to maximal functional capacity.

Physical Medicine in Athletic Rehabilitation

ALVIN M. BROWN, MD
Director
Department of Rehabilitation Medicine
Flower and Fifth Avenue Hospital
New York, New York

Physical medicine concerns itself with the use of physical measures in the treatment of diseases and injuries. In the evolution of physical medicine, the various procedures have been grouped as thermal, mechanical, electrical, and chemical. These classifications, however, are not delimited. Thermal measures, for example, cause mechanical, electrical, and chemical changes. Methods termed mechanical produce thermal, electrical, and chemical variations. Similarly, electrical and chemical measures can be responsible for changes to which these other terms may be applied. One can readily see, however, that this general approach to the use of physical agents in athletic rehabilitation can be quite confusing.

Physical measures most commonly used in modern athletic rehabilitation are: heat, cold, therapeutic exercises, massage, splinting, and compression bandaging with elastic bandages or adhesive tape.

Heat and cold are perhaps the two most generally used physical measures and the modalities most often used in providing heat and cold are as follows:

I. Hydrotherapy: external application of water furnishing superficial heat and cold
   A. Whirlpool bath
      1. Cold: 35° to 50° for 20 to 30 minutes
      2. Hot: 100° to 115° for 20 to 30 minutes
   B. Hydrocollator packs: canvas enclosed packs of silica gel heated in water to 140° to 160°. Several layers of towels are placed between the pack and the skin.

II. Electromagnetic radiation (deep heat)

A. Short wave diathermy: therapeutic application of high frequency currents to produce heating of tissues (2 to 4 cm). Most machines operate at a frequency of 27 megacycles with a wavelength of approximately 11 meters. The contour applicator (drum) is most widely used. Intervening layers of toweling are used to absorb perspiration. The treatment time is 20 to 30 minutes.

B. Microwave diathermy (deep heat): operates at a frequency of 2,450 megacycles with a wavelength of approximately one meter. It has A, B, C, and E directors; the B director is used most often. The treatment time is 20 to 30 minutes.

III. Ultrasound (deep heat): a form of acoustic vibrations occurring at frequencies of 0.7 to 1.1 megacycles per second. These mechanical vibrations are converted to heat (4 to 8 cm). A coupling agent is needed, such as water (70° to 75°) or aquasonic. Standard treatment is 1.5 wts/cm^2 for 6 to 8 minutes with aquasonic or 2.0 wts/cm^2 using water.

Superficial heat in the form of hydrotherapy is universally safe in the treatment of athletic injuries, but deep heating agents such as diathermy and ultrasound are not without dangers. Precautions in the use of diathermy are as follows:

1. All clothing should be removed from the areas to be treated, in order to eliminate its effect on radiation.

2. Patients should experience only a pleasant sensation of warmth during treatments.

3. Patients should report burning or pain at once. These should be used as an indication for stopping treatment or reducing dosage.

4. All metallic objects should be removed from the region of treatment. Metal objects may concentrate the field and cause burning.

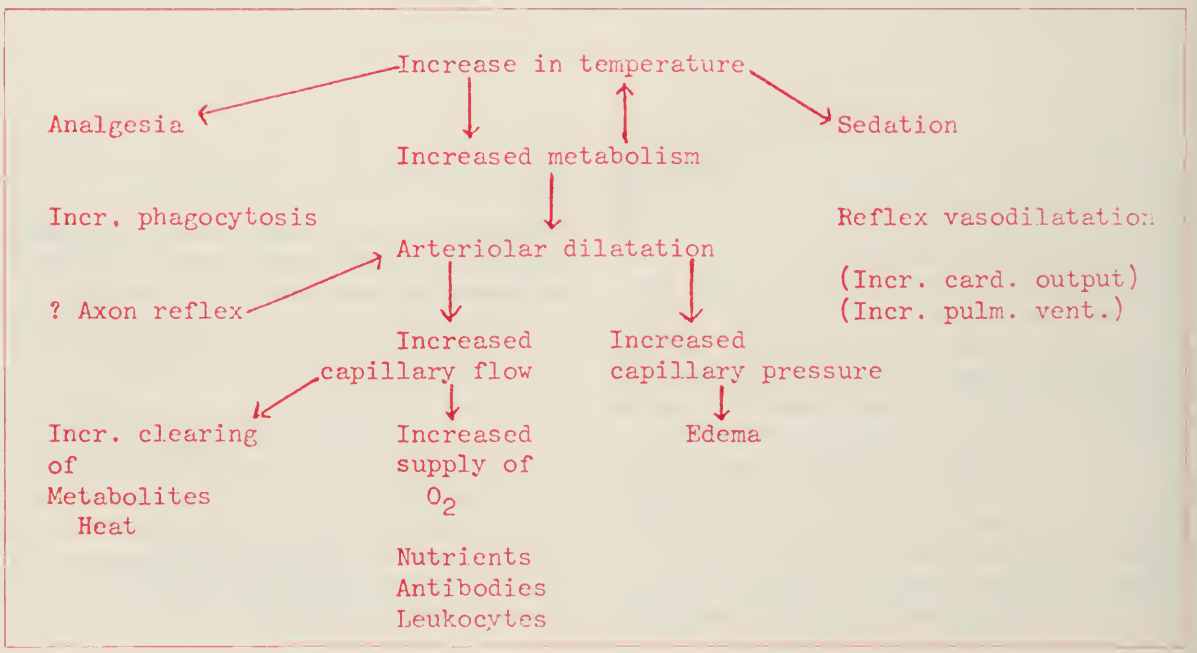
5. Care should be exercised in treating over superficial bony prominences in order to avoid overheating.

6. The area under treatment should be kept dry.

7. Diathermy treatment should be avoided through plaster casts, adhesive strapping, etc.

8. Avoid treatment over areas with noninflammatory edema and thrombophlebitis.

Precautions in the use of ultrasound are as follows:



1. It should not be used over epiphysis of growing bones.

2. It should not be used over the reproductive organs, the heart, the eyes, the lower cervical sympathetic ganglia, and directly over the spinal column.

The physiological effects of local heating of athletic injuries are depicted graphically in Figure 1.

The physiological effects of local cooling are shown in Figure 2.

Figure 1: Physiological Effects of Local Heating [1]

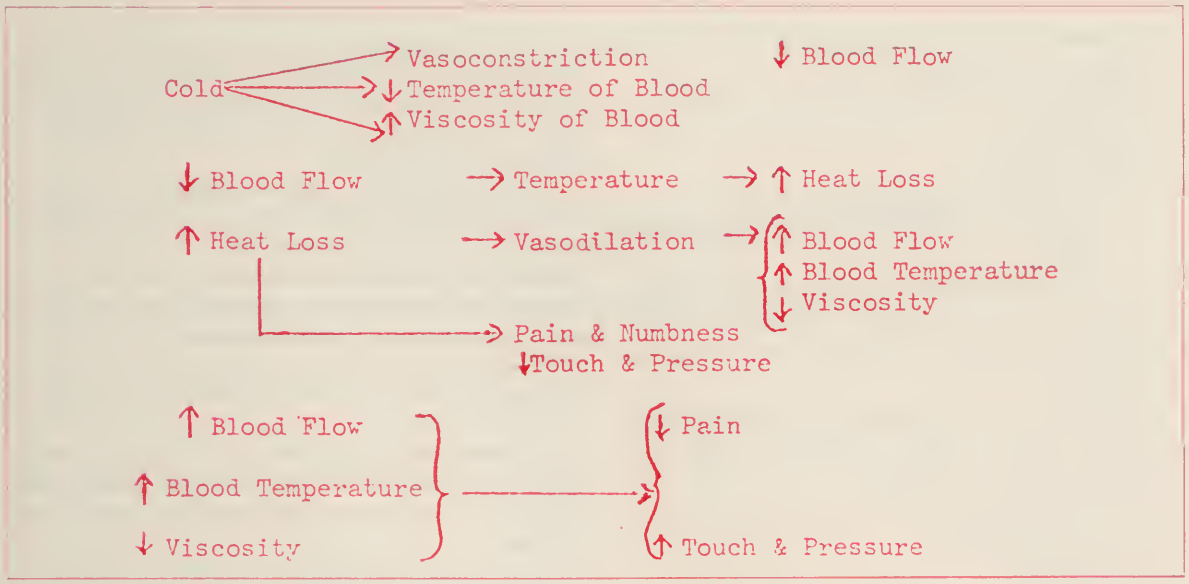


Figure 2: Physiological Effects of Local Cooling

Massage is a term used to signify a group of systematic manipulations of body tissues which are performed with hands for the purpose of affecting muscular relaxation and sedation. It is perhaps the oldest of all physical methods of treatment as it is an instinctive act. As a tool in the management of athletic injuries, however, it is receiving less and less emphasis today. The most frequently used massage technique today is that of effleurage, a stroking type of massage. Kneading and frictional compression massage are used most often for muscle cramps and chronic muscular conditions, such as fibrositis, respectively. Tapotement (hacking) is rarely used today.

Therapeutic exercises, a rarely used physical measure in past years, are becoming increasingly more important in the restoration of the injured athlete to maximal functional capacity. They may be defined as the prescription of bodily movement to correct an impairment, improve musculoskeletal functions, or maintain a state of well being. Types of therapeutic exercises are:

1. Active exercises (patient performs movement) to maintain muscle strength and joint range.
2. Active assistive exercises (patient is helped in performing movement) to mobilize weak muscles.
3. Passive range of motion exercises (involved muscles are moved for patient) to maintain joint range.
4. Passive stretching exercises (stretching of soft tissue contractures) to increase joint range.
5. Resistive exercises (mobilization of muscles against resistance) to strengthen muscles.
6. Isometric exercises (contraction of muscles without joint movement) to strengthen muscles and maintain tone.

Splinting and bandaging are used primarily for immobilization, compression, and support in treatment of athletic injuries. Splinting is used most generally in the immobilization of suspected fractures, whereas adhesive strapping and elastic bandaging are used for both compression and support, and are quite widely used. In my experience, I have found that adhesive strapping properly applied is of the utmost importance in the early rehabilitation of the athlete. There are, however, many different methods of applying elastic bandaging and adhesive tape to the same type of injury. Bandaging also includes the use of a sling which is used primarily for immobilization.

Traction and gentle manipulation are measures infrequently used in athletic rehabilitation. These physical measures should be left to the judgment of the physician because of the damaging results that can accrue from the indiscriminate use of these methods.

Rehabilitation is a term that is synonymous with restoration. In athletic rehabilitation, we are concerned with the restoration of an athlete to his maximal functional capacity, not only physically, but also psychologically. There are concomitant social and vocational values accrued especially in professional athletics. In order to most efficiently utilize physical medicine in athletic rehabilitation, one has to properly diagnose the condition being treated and appropriately select the physical measures to be used.

The most common injuries confronting athletes in strenuous sports are as follows:

1. Contusions: direct blow causing bruising of the skin and underlying tissue
2. Hematomas: collection of pooled blood in a restricted area
3. Open Wounds
   a. Abrasion: scraping injury to skin
   b. Laceration: separation of skin with irregular edges
   c. Puncture: wound by a penetrating object
4. Strain: injury to muscle or tendon, or both
5. Sprain: injury to joint and surrounding ligaments
6. Dislocation: displacement of a bone forming a joint with or without ligamentous damage
7. Inflammatory conditions
   a. Tendinitis
   b. Tensosynovitis
   c. Bursitis
   d. Capsulitis
   e. Lymphadenitis
8. Fracture: discontinuity of bone structure
9. Cramps: muscle spasm

A general approach to the use of physical agents in the treatment of athletic injuries can be simplified if one properly categorizes the problem confronting him. All injuries are divided into acute, subacute, or chronic conditions, or all three.

In musculoskeletal injuries, such as strains, sprains, dislocations, and fractures together with contusions and hematomas, the acute phase generally lasts from 24 to 48 hours. Its onset is at the time of injury and it ends with the stabilization of the cardinal signs of musculoskeletal tissue injury such as swelling, increased tenderness, heat, discoloration, and limitation of motion.

The inflammatory conditions are generally secondary to a previously existing musculoskeletal injury and the cramps are generally self-limiting. Open wounds will be discussed separately from the above mentioned injuries.

The subacute and chronic stages of the above mentioned injuries last for varying periods of time. These stages last collectively from the period of cardinal sign stability to the time when the athlete is free of all signs and symptoms of his injury.

Generally speaking, the approach to treatment in the acute phase can be summed up in three letters, "ICE". These letters stand for ice, compression, and elevation.

Ice or cold prevents excessive swelling and decreases pain (see Figure 2). It reduces the development of the other cardinal signs of musculoskeletal injury, for example, heat, discoloration, limitation of motion, and tenderness.

Compression also aids in reducing swelling by compressing the extra compartmental circulatory spaces.

Elevation is merely a mechanical measure to enhance local circulation by improving venous flow to the heart. Naturally, the dislocation has to be realigned properly prior to applying these measures, and the fracture has to be splinted before mobilizing the injured athlete.

Treatment during the subacute and chronic stages can be summed up in the following three letters, "HEM". These letters stand for heat, exercise, and massage.

Heat decreases swelling by a different mechanism than cold does (see Figure 1). It facilitates the resolution of the cardinal signs of musculoskeletal injury.

Exercises of a therapeutic nature are used for maintenance of muscle tone, strengthening, and regaining normal joint range.

Massage is a mechanical method of enhancing circulation and can be done manually or through the use of whirlpool baths or ultrasound.

It is my opinion, however, that superficial heating agents are most effective in the early subacute stage and the deep heating agents are most effective in the late subacute or chronic stages.

Open wounds can be treated simply by first stopping the bleeding by direct pressure and then thoroughly cleansing the wound prior to the application of a sterile dressing. Lacerations, however, often have to be sutured. On the other hand, dressings are not always necessary for abrasions as they often heal faster when left exposed after thorough cleansing.

To summarize, physical medicine activities properly prescribed can be of the utmost importance in athletic rehabilitation. However, for restoration of the athlete to his maximal functional capacity, the following requirements are necessary:

1. **Etiology of injury or how athlete was injured**
2. **Significant past medical history**
3. **Basic knowledge of anatomy, physiology, and kinesiology**
4. **Proper management and selection of physical methods during the acute, subacute, and chronic stages of injury**

A superbly fit athlete with a love for her sport is hard to hold down. Her enthusiasm for her sport is bound to reflect in her enthusiasm for life and for whatever else she does. Yet, I feel that we, who are in the position to do otherwise, have neglected to encourage young women to participate in competitive sports.

Athletic Competition for Girls

TENLEY ALBRIGHT, MD
Boston, Massachusetts

Many of the reservations about girls in athletic competition connote concern about menstrual cycles and childbearing. However, studies have shown beneficial, rather than detrimental effects resulting from female sports participation. I find this concern especially among the scientists, officials, especially men, who worry about this much more than the girls themselves do.

This participation, in addition to helping an athlete stay in top condition, also helps her to fulfill her potential. Women can do many things and do them well and still remain feminine. In this country, we

can take as an example women jockeys, or even marathon track runners.

Similarly, the Russians have proven that a woman is quite capable of participating in space ventures. In Israel, women are drafted into the army. Granted, Russian space exploration and Israeli conscription are not forms of fitness participation, but both are examples of what women can and do accomplish, while still remaining feminine.

By taking part in sports, a dedicated athlete attains a state of fitness. This fitness means a lower basal heart rate and a higher pulse rate with exercising. It guarantees a more efficient stroking contraction power of the heart, and a better pulmonary function, with increasing vital capacity and greater ability to inspire a large amount of air and oxygen. Fitness offers the athlete lower blood pressure, flexibility, and muscle power. But most important, fitness gained through skating or other sports participation means being able to cope with life and its emotional as well as its physical strains. Surely these obvious advantages to be gained from athletic competition counter the argument proposed by some people that competitive sports adversely affect young women.

From my own experience, I feel qualified to urge people to encourage young women to participate in sports, any sports. I want to tell you to recruit all girls for skating, but I won't. Instead, I will show you, by a case study of mine, the effects of sports competition in general, and skating competition in particular, on the life and habits of one young girl.

Kathy Taylor is an attractively shy and unassuming 13-year-old. She attends school five days a week but skates six days a week. She usually spends 2½ to 3 hours a day working on her jumps, spins, control, and precision tracing. The skating does not interfere with her studies as might be expected. On the contrary, the better her studies, the quicker she finishes, the more she can skate, and the better the chance that her teachers will sanction her missing a few school days to travel across country or across the ocean to attend a meet.

I said that Kathy was shy. She is, off the ice. On the ice, Kathy is bold in her own world of speed, height, and self-discipline. She matches herself against what she did the last time she stepped on the ice, and what she hopes to do the next time. She is completely free on the ice, yet her seriousness of purpose shows through.

Kathy's life is very complete. Besides her practice skating, she has half-hour lessons four times a week. She even had time to help a group of younger skaters plan a number for their Christmas skating pageant. Her skating gives her an appreciation of time. She balances her challenging schedule to fit in time for school, extracurricular activities, skating, friends, family, and home. From observation, I have seen Kathy learn how to handle competition both on and off the ice. I think skating has made her see how aims can be realized with effort.

Of course, Kathy has learned to accept the handicaps of her sport such as exhaustion, discipline, bruises, and stress. For the love of the sport, she endures. She knows what it is to achieve a sense of accomplishment, and she knows what it means to work hard. I feel that this sports participation has made Kathy a very interesting young lady and I do not feel that it has detracted from her femininity in the least.

I noted at the beginning that many people think that sports affect a woman's biological functions. But athletic training does not interfere with the rhythmic menstrual cycle. Stress perhaps, the emotional stress of a competition, may suspend or postpone the start of a period, but the normal cycle is soon resumed. Physicians find more complaints of irregular or missed periods from models or airline hostesses with drastic diets over a long period of time, than from athletes.

Women today do not get enough opportunities to exercise their bodies. True, they climb steps, pick up after the kids, and tangle with the vacuum cleaner, but this is not the real type of exercise to which their cave girl ancestors were accustomed. In order to survive, today's woman does not find it necessary to build a shelter or to run down an antelope. But yet, women have this inherent potential. They could still do these things if they had to.

General James Gavin of Cambridge, Massachusetts, feels that friendly competition with extreme physical activity and all-out effort can prepare young adults to coexist in the world in a friendly atmosphere on a large scale.

Studies, particularly the Helms Study which was part of Project Talent conducted by the National Football Foundation, have shown that the term "dumb athlete" is a misnomer. There has proven to be a definite positive correlation between athletic competition and mental aptitude.

Mothers, then, need not fear that participation in sports will hamper their daughters' scholastic achievement. On the contrary, sports participation, particularly serious athletic competition, can offer any young woman a sense of release. It affords her the chance to give her all, and to relish that sense of accomplishment that results from doing a job well. It helps her to develop into a more conscientious individual by teaching her self-discipline. It really makes her a more interesting person and, in turn, a more feminine woman.

Today, we are finally realizing the importance of investing both time and money in furthering athletic programs for women. We should do this because a sound mind and a sound body do go hand in hand. The Greeks realized this fact centuries ago. It's about time we did too.

The Use of Drugs in Athletics

WILLIAM J. KINNARD, JR., PhD
Dean, University of Maryland
School of Pharmacy

A major problem today is drug abuse among young people. In athletics, many different drugs have been used in the past and are now being used to enhance an athlete's performance and to hasten his recovery. We, as adults, must help them develop the respect for drugs that can only come from their judicious use. Let's be sure that we are working with the "natural" athlete and not one who, through the excessive use of drugs, is forced to perform at a level far past his normal limitations.

We have gone through the stone age and the iron age, and through ages of conquest and war. While today's times can be given many labels, one which certainly applies is "the drug age". It began approximately in 1950 and has lasted 20 years. While it is true that many drugs were available for centuries before this age, it wasn't until the 1950's that such a vast number of drug products became available. These included new, more specific therapies and older products made more effective and less toxic. A professional and public confidence in the effectiveness of these drugs soon developed, a confidence based on the idea that these drugs were almost totally specific and nontoxic in their actions.

We unfortunately developed an overconfidence in the use of these agents and, with this, an often indiscriminate and uncautious approach to the prescribing and taking of drugs. This led to drug misuse and the problem of drug abuse that we see today. The casual use of drugs by often well-meaning adults has helped to set the proper conditions that trigger the widespread drug abuse problem. One can attempt to place the blame for our problems on many people, and even on society as a whole. But the time is past when we can afford to continue looking for someone to blame, when instead we should begin to tighten the manner in which we use drugs.

This does not imply increased legislation and longer jail sentences. This is not an answer. We must turn to a more discerning use of these agents. This could and should mean that fewer drugs will be taken.

Each of us must take a greater responsibility in our own use of drugs, each of us as a patient—whether we prescribe for ourselves or take medicine prescribed by a physician or dentist—each of us involved in the control of drug distribution, each of us as a parent or neighbor. This responsibility becomes extremely important when one is dealing with young people, not only because of the problems that involve drug abuse, but also because of the fact that

drugs may elicit unwanted or adverse reactions in young, developing adolescents.

How can we use drugs more judiciously? The first thing is to recognize that many drugs are toxic, not only in high doses, but even in doses used therapeutically. Tunnel vision in the use of drugs cannot be allowed to continue. Drugs should only be used when a clear therapeutic indication exists, and not to unnecessarily alter the normal physiological processes.

Many different drugs have been used to enhance an athlete's performance and to hasten his recovery. *Sports Illustrated* recently discussed some of the less than ethical practices used by a few physicians, trainers, or coaches. Why is it wrong to use some of these drugs as these people did or are still doing? The lack of morality is argument enough against this, but the adverse reactions that may occur are also a strong reason not to follow this line of misguided therapy. What are some of these reactions?

The amphetamines have been used to enhance athletic ability and reduce fatigue, but central nervous system stimulation is not the only pharmacologic effect caused by these drugs. They will also increase the heart rate, raise blood pressure, suppress appetite, slow intestinal contractility, etc. The initial stimulatory effect is followed all too often by depression and a heightened sense of fatigue. They have a high potential for abuse and one of the derivatives, methamphetamine (speed), will soon be singled out for strict control under the new federal laws.

The use of anabolic steroids to hasten recovery of muscle damage or to enhance muscular development has no place in athletics. These drugs are chemical derivatives of testosterone, the male sex hormone and, while they do not have as potent an androgenic effect as the parent drug, they can still exert a similar effect. High doses of these drugs actually suppress testicular activity, and may reduce the final height achieved by the boy.

The use of proteolytic enzymes to treat inflammation or reduce edema in traumatic injuries can be dangerous. These enzymes are nonspecific and will also break down the normal barrier the body builds around an infection and allow it to spread.

Vitamin B_{12} has little rationale for use in athletics unless the athlete has pernicious anemia. In a well balanced diet that most training tables are supposed to provide, there is no need for supplemental vitamins of any kind.

Ethics are a necessary part of our society. They are even more important in dealing with competitive events involving athletes that are developing in mind as well as body. It becomes important to restrict the use of drugs to only clearly indicated conditions. This will hopefully foster a respect for drugs by these athletes who are quite often school leaders. To aid in the restriction of the use of these drugs, each group involved in the coaching, conditioning, or treating of athletes should have a well-defined policy concerning their use of drugs. The policy that follows, adopted by the Santa Clara Medical Society in California, is an example of such an ethical code.

The following policy statement regarding the use of potentially hazardous drugs by athletes, to artificially improve their performance, was unanimously adopted by the Council of the Santa Clara County Medical Society at their March 3, 1969 meeting.

1. In the words of the International Amateur Athletic Federation: "no agent which stimulates muscle and nerves, or paralyzes the sense of fatigue or is habit forming should be used by any athlete".
2. To be more specific, as stated by the National Federation of State High School Athletic Associations and the Committee on Medical Aspects of Sports of the American Medical Association, "whether done unknowingly, tacitly, secretly or openly, the use of unwarranted ergogenic aids in sports is to be unequivocally condemned". The definition of ergogenic aids is "those drugs used to increase the capacity of bodily and mental effort especially by eliminating fatigue symptoms". Under this broad category especially the anabolic-androgenic steroids and amphetamines should be singled out for condemnation.
3. There is no excuse for giving anabolic-androgenic steroids to healthy athletes of any age and especially adolescents. The ill effects of the anabolic-androgenic steroids such as decreasing ultimate height, virilization, precocious puberty. testicular atrophy, decreased libido and liver function changes are insidious and are not immediately apparent.
4. Speaking on the amphetamines, these are the most widely abused non-narcotic drugs and when used to push the athlete beyond his normal endurance level can be harmful and even fatal, not to mention the problem of dependence and ultimate psychosis that is all too prevalent a complication lately. There is also no place for the use of amphetamines in a well conditioned athlete under the guise of being an appetite suppressant. No person in competitive athletics should be taking any amphetamines for therapy of any condition while he is competing. If the condition is such as to warrant their use then this condition should disqualify the participant from the athletic program.
5. There is no conclusive evidence that nutritional ergogenic aids such as food and vitamin supplements or oxygen have a place in a training program for normally nourished, well conditioned, healthy athletes.
6. The available evidence indicates that the usefulness of oral or intramuscular enzymes has not been established.

The special health hazards inherent in athletics often lead to valid medical reasons for administering a drug or drugs to an athlete. Drugs used in these instances are often called "restorative" drugs, or drugs that provide immediate physical relief to an injured athlete and hasten his recovery. It must be emphasized that restorative drugs are not intended to be administered to an injured athlete for the purpose of allowing him to continue competition in spite of the injury. In all but the professional athlete, this represents a grave example of drug abuse.

The Use of Drugs in Athletics

GARY G. BUTERBAUGH, PhD
Assistant Professor of Pharmacology
University of Maryland School of Pharmacy

Many drugs have little or no rationale behind their use in the normal, healthy athlete. These drugs have often been referred to as "additive" drugs, or drugs used with the sole purpose of stimulating the athlete or increasing his performance beyond natural limitations. Many of these additive drugs are particularly dangerous because they further strain physiological systems already strained by physical exertion and, furthermore, mask the symptoms of developing fatigue or exhaustion.

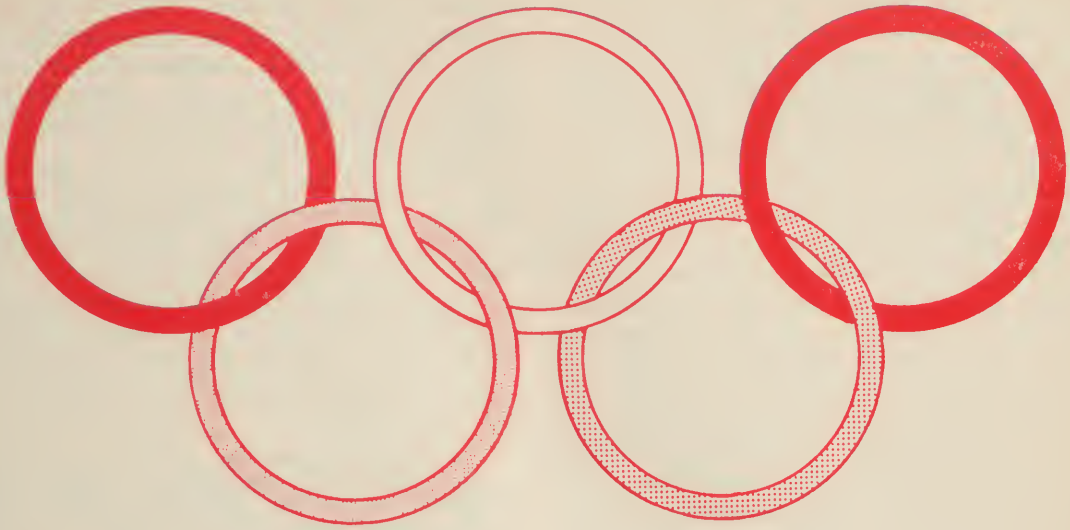
One of the most common occupational hazards of athletic competition is, of course, pain, and includes not only the pain of serious injury but also the continuous small aches and pains. An athlete is often distracted by even the smallest pain, probably because he is aware that he has access to drugs that will provide relief. Thus, it is not so unusual that pain represents one of the most common reasons drugs are used in sports.

There are two general kinds of anti-pain drugs: the local anesthetics such as Novocain, Xylocaine, and ethyl chloride spray; and those that suppress pain

by acting on the central nervous system, including morphine, Demerol, codeine, and pentazocaine (*Talwin*). While these drugs will relieve pain, it should be remembered that the cause of the pain must be determined and eliminated rather than masked by drugs. No competent trainer or physician ever administers a pain-killer and sends the athlete back into competition if the injury involves a weight-bearing structure. If a boy continues to play with an injured knee or ankle, it is obvious that the injury can be aggravated. One cannot help but wonder how many athletes suffer serious injury later in their career because they played with injuries masked by pain-killers. Is the immediate victory really worth the possible permanent crippling injury to the athlete and the prevention of a possible professional career?

There are, of course, other problems associated with the use of pain-killers. Xylocaine often causes sedation, and the continuous use of Novocain, depending upon the individual, can produce side effects ranging from excitation to coma to convulsions, as well as many allergic-type reactions. The potent narcotic agents present the added danger of developing a tolerance to the pain-relieving properties of these compounds. If the athlete manages to escape aggravation of the injury, larger and larger doses are needed to suppress the pain. Aside from possible physical and psychological addiction, a real problem is that he does not develop tolerance to other effects of these compounds. These effects include pupillary constriction with possible interference with vision, contraction of bronchial smooth muscle which would contribute to respiratory difficulties and, finally, severe constipation. All of these will impair the athlete's capability to compete satisfactorily.

A special category of pain-relieving drugs includes the anti-inflammatory compounds such as cortisone, hydrocortisone, and Butazolidin. These compounds are often injected into the synovial space of injured joints to relieve swelling and inflammation. Contrary to popular belief, the use of these compounds can be extremely dangerous, even toxic, especially when used over extended periods of time as they are often used in sports. The biggest danger is that although the inflammation is relieved, the cause of the inflammation is not. Therefore, the athlete must be cautioned to limit activity of the treated joint even though there is distinct symptomatic relief, as the inflammation remains active and use of the joint may accelerate cartilage deterioration. Cortisone can lead to the gradual degeneration of bone structure. Thus, the continued use of cortisone to relieve pain and swelling in a pitcher's elbow while he continues to pitch may lead to degeneration of the elbow with crippling results. The same applies to a fullback's knee. Butazolidin produces toxic reactions in about 25% of those persons treated with it. These range from peptic ulcer to bone marrow depression to fatal blood disorders. It should be obvious that the promiscuous use of these drugs in order to keep an athlete in competition is to be avoided and condemned.



In addition to pain, a frequent problem encountered in athletic competition is the ever-present tension and continued pressure placed upon the athlete to win. Many athletes may need and even demand antispasmodic and tranquilizing drugs to control pregame jitters and nausea. Considerable variation in opinion exists among coaches and trainers as to the use of these drugs, since the problems encountered are ethical, rather than medical. The natural limitations brought about by an athlete's inability to deal with pressure should not automatically make him eligible for a tranquilizer. The same principle applies to those athletes as applies to those taking pep pills: They are attempting to derive something from the use of drugs which they do not think they naturally have.

Another problem arises from the fact that any of these tranquilizing drugs—Miltown, Nembutal, Equanil, Librium, Thorazine, etc.—cause some degree of sedation. Since these drugs are often given to athletes participating in action or motion sports, the trainer or team physician who administers them is often walking a tightrope between calming the athlete and sedating him to such a degree that his athletic ability is impaired. The high-strung and jittery cornerback may be calmed before the big game but may be so sleepy during the game that he is beaten on a pass pattern.

Many of the preparations, especially the antispasmodics, contain ingredients which affect the innervation of the eye, causing blurred vision. This could be especially disastrous to a baseball or basketball player. In addition, an important consideration is the development of potentially hazardous drug interactions involving the central nervous system resulting when more than one of these compounds is administered simultaneously.

In spite of the specific instances where the "restorative" drugs may benefit the injured athlete, we must remember that drugs are meant only for the treatment of injury or disease. They are not meant to be used as a "chemical-crutch" to substitute for the natural physical or psychological athletic prowess of the sports competitor. I think it is justified to again stress that no drug should be used for the sole purpose of keeping an athlete in competition. If the injury or emotional disorder is serious enough to warrant the use of drugs, the athlete should not be allowed to compete until the problem has been solved.

And finally, you are again charged with the responsibility of setting the example of intelligent drug use to the young people of our society. They, in turn, can develop a respect for drugs and will, hopefully, avoid the indiscriminate and uncautious approach to drug use which so often leads to drug abuse.

Psychological and Psychosomatic Problems of Athletes

BURRIS F. HUSMAN, EdD
Professor of Physical Education
University of Maryland
College Park

The psychological problems of athletes are those related to behavior. Likewise, anything influencing the mental processes or behavior of the athlete can have an effect on him physically. Aggression, anxiety, motivation, level of aspiration, self-confidence, courage, emotional state, tolerance of pain, proper state of mind, fear of failure or fear of success, and self-esteem are some of the factors related to performance.

In any discussion of the psychological and psychosomatic problems of athletes, it must first be clearly understood what is meant by the terms psychological and psychosomatic. According to Dorland's Medical Dictionary, psychological relates to the scientific study of mental processes and behavior.[1] Literally, "psycho" means mind, and "soma" body, thus psychosomatic means mind-body relationships.

On the basis of these definitions, it is apparent that the psychological problems of athletes are any problems related to behavior and can be multitudinous. Likewise, anything influencing the mental processes or behavior of the athlete can have an effect upon him physically. Therefore, athletic problems can be caused by environmental factors such as disease, infection, hunger, drugs, heat, and cold. Other problems can arise from society. Competition, city life, home life, and boy-girl relationships may influence the performance of the athlete. Lastly, and most importantly, athletic problems may be psychological in nature. Some examples of psychological problems may be a lack of motivation, anxiety, fear, aggressiveness, and doubt in one's manliness or ability. It should be apparent that the problems of the athlete may arise both from within the individual or without.

Before I look specifically at some of the above proposed psychological problems, I would like to carry the above discussion a bit further to relate to you the importance of these internal and external factors influencing performance. Every successful coach must know the total athlete, that is, he must not only know what is influencing the athlete physically, but he must also know what is influencing him mentally, socially, and emotionally. Ken Doherty, Track Coach of the University of Pennsylvania, describes the type of training required to secure top performance as the "Holistic Theory of Training".[2] In this theory, the coach must not only train the athlete physically, that is, increase his endurance, make sure he is getting the proper diet, rest, and so forth, but he must also learn as much as possible about the athlete's emotional, mental, and social problems, so that he may train the *total* athlete.

We have all seen an underrated team soundly trounce the obviously superior team. (With hesitation and tongue in cheek, I might mention to Baltimore fans their experience with the New York Jets and New York Mets.) What are these intangible factors that separate a winner from a loser? Is it a proper state of mind? Is it motivation? Is it the proper emotional state? Is it fear of success? Is it the athlete's level of aspiration, or is it confidence in self? Why does a group of athletes who are apparently going all out, but losing, suddenly catch fire? Why does coaching strategy succeed in one game and fail in another?

Reuben Frost noted in a recent talk at the National Convention of the American Association for Health, Physical Education and Recreation, that answers to these questions are not readily available. He said, "Involved are nebulous, intangible things like feelings, ambitions, desires and inner resources. We must try, however, to apply some of our scientific knowledge to these situations and see if we can approach a few answers." [3]

Considerable research has been conducted over the past 20 years to study answers to these questions. Of particular interest is the research conducted on the personality characteristics of champion athletes. In a paper entitled "Sport and Personality Dynamics", recently presented at the 72nd meeting of the National College Physical Education Association for Men in Durham, North Carolina, I summarized this research as follows:

> **"Apparently, there is some basic agreement as to the personality traits of some athletic groups, particularly champion athletes. Johnson, Hutton, and Johnson, Ogilvie, and Kane agree that, in general, champions:**
>
> **1) are or have the need to be more aggressive,**
> **2) are more extroverted in team sports,**
> **3) have exceptional feelings of self-assurance, and**
> **4) have greater abstract reasoning ability.**
>
> **There is considerable disagreement over the level of anxiety and the ability of champions to control their emotions."** [4 (p 63)]

It is of interest that the psychological and psychosomatic problems of athletes are involved with these personality characteristics. For this reason I have arbitrarily arranged the problem areas to be discussed under five headings: motivation, aggression, level of aspiration, stress and anxiety, and fear of success.

Motivation

One of the major problems of the athlete and athletic coaching is that of motivation. Motivation, for the purposes of this discussion, relates to the basic human needs which energize behavior. These human needs are extremely complex and difficult to identify. According to some psychology theorists, these needs or motives are learned, while others believe many of these needs are innate to the human organism. Some believe that these motives are for the most part conscious, while others believe that they stem from the unconscious. The theorists who believe that motives are learned believe that behavior which is pleasurable, that is, behavior which is rewarded in some way, results in an attempt by the organism to repeat this behavior. If an athlete participates in sport for social acceptance, self-esteem, an athletic award, etc., he would be motivated by learned conscious habits. Those theorists who believe that behavior is driven by some innate unconscious

factor, usually the traits of sex or aggression, believe in Freudian psychology. If the athlete participates to relieve his aggression or to alleviate a feeling of masculine inadequacy, or to develop a beautiful body, he is said to be motivated by unconscious drives.

The former theory, that motivation is learned, is the most common sense theory and the easiest to understand. I believe I can safely say that most coaches base the motivation of their individual athletes and athletic teams on this theory. Award, reward, security, companionship, new experiences, the desire to be held in esteem and, in some cases, to be punished are all techniques successfully used for motivation. The athlete is aware or conscious of this type of motivation.

The unconscious motives are much more difficult to comprehend, unless one has special training and spends considerable time in analyzing the behavior of his athletes. Unconscious motives are not easy to identify since they are disguised by such psychological mechanisms as rationalization, regression, repression, and sublimation. According to Maslow and Mittlemann, unconscious motives usually involve the avoidance of pain, danger, or emotional hurt, or the protection of self-esteem or security.[5]

To emphasize the complexity of motives, I would like to cite as an example the athlete who is motivated to excel in athletics, since this may be the only basis for acceptance at home. If the athlete fails to succeed, he will feel unworthy. The father humiliates the athlete by constantly forcing him to further athletic endeavor, when he is not capable. It is also possible for the athlete to resort to unethical tactics to satisfy his parent's unwholesome competitive need. This type of motivation is dangerous, and certainly is not conducive to an outstanding performance.

It should be apparent that motivation and motives for participation are almost anything affecting the individual athlete. The psychological problems of athletes are interwoven with motivation or some aspect of motivation. I would now like to turn to the second problem area, namely, that of aggression.

Aggression

Some of you will see a relationship between the need to be aggressive, mentioned as a characteristic of the champion, and motivation. That there is a relationship between aggression and motivation is substantiated by Storr in his book *Human Aggression:*

> **"One difficulty is that there is no clear dividing line between those forms of aggression which we all deplore and those which we must not disown if we are to survive. When a child rebels against authority he is being aggressive: . . . The desire for power has, in extreme form, disastrous aspects which we all acknowledge; but the drive to conquer difficulties or to gain mastery over the external world underlies the greatest human achievements. . . .**
>
> **"The aggressive part of human nature is not only a necessary safeguard against predatory attack. It is also the basis of intellectual achievement, of the attainment of independence, and even of that proper pride which enables a man to hold his head high amongst his fellows."** [6]

There is considerable evidence that participation in sports provides a socially accepted outlet for aggression without accompanying feelings of guilt. If an athlete has a high innate drive to aggress, sports participation may lower that drive, since the athlete is given the opportunity to aggress in the most violent way. This is especially true in football, wrestling, and boxing. As long as he participates within the confines of the rules, he may escape the guilt which usually accompanies the expression of aggression. (Some evidence substantiating this concept was provided by my dissertation where I was able to show that cross-country participants had considerably more extra-punitive aggression than boxers or wrestlers.) Since competition comes from the aggressive side of nature, these feelings of aggression should be discouraged if they develop away from athletic activities. Many athletes are troubled by feelings of guilt when forced to express aggression.[7]

Beisser, in his book *Madness in Sports,* has further described the importance of aggression to competition:

> **"The poor competitor has learned to fear aggression most of the time, the average competitor fears it occasionally and the good competitor fears it only infrequently. It has been observed that the poor competitor avoided aggression in many ways both on and off the field. They spoke softly, and they avoided arguments. They tried to maintain friendly relations with their rivals under all circumstances."** [8]

I am suggesting that in those sports where you compete at a distance, where you do not come in physical contact with your opponent, you may want to provide your athletes with some body contact sports as a part of their conditioning program. Now let us turn to the level of aspiration.

Aspiration

The achievement motive is directly related to the athlete's level of aspiration. For the purposes of this discussion, the level of aspiration is defined as the "standard by which a person judges his own performance as a success or a failure, or as being up to what he expects of himself".[9]

The athlete will evaluate himself on his opinion of self, that is, on his self-concept, and on the opinion of the ability he possesses. I am sure that some of you have seen the following reaction to defeat which is described by Ryan in a paper entitled, "What

does Psychology have to Offer Coaches and Trainers?", which was presented at the 68th annual meeting of the NCPEAM in Minneapolis in January 1965:

> **"One boy, after being beaten by a conference champion or national champion would be terribly disappointed or even shamed, while a second boy would suffer no discomfort under the same circumstances. In fact, the second individual might actually react as if he had won. Two boys, the same situation as far as the contest was concerned, but two completely divergent reactions to defeat."** [9]

According to Ryan, research has resulted in the following hypotheses regarding level of aspiration: [9]

1. **Success experiences usually lead to a rising level of aspiration.**

The implications for coaching here are obvious—schedule schools against which your team or the individual sport participant can consistently be successful.

2. **Failure generally results in a lowering of one's aspiration.**

This hypothesis tells us why teams which have a losing season one year, usually have a poor season the next year. The players, and perhaps more often the coach, indicate that they will have a successful season if they win half of their games.

3. **The effects of failure on levels of aspiration are more varied than are those of success.**

If an athlete succeeds, he almost always will set his sights higher. If he fails, he may set his sights lower, leave them the same, or set them higher. If the individual refuses to lower his level of aspiration, he may be protecting himself in two ways. First, it may help him to disregard the failure. And second, the social value of never admitting defeat strengthens the individual in his relationship with others. For example, if a high school athlete misses his high jump at 6′10″, rather than lower the bar, he again tries at the same height or raises the bar. If he again misses, no one can blame him for missing at that height.

Ryan writes, "If the individual experiences a performance below his level of aspiration, and sees it as a severe threat to his self-esteem, he may keep his level of aspiration low to prevent such a situation from arising a second time. (Or as mentioned above, the level of aspiration may be so high that no one could blame him for failing.) A boy, who thinks he might be beaten, rather than compete, may in some cases actually refuse to participate. He may fake an injury or illness or find all sorts of excuses for avoiding the contest." [9]

In fact, it may be possible that some athletic injuries occur because this is the one way the individual can still protect his ego and still be a winner. If this occurs, the athlete has solved his problem through psychosomatic methods. We certainly need further research to determine whether or not the athlete puts himself in an injury situation to satisfy some unconscious need.

Finally, failure or the possibility of failure decreases motivation, causes a loss of interest, and thus, a complete withdrawal from the task. I am sure we have all experienced the loss of athletes from our squads for this reason.

4. **In groups, where comparison with others in the group is possible, the level of aspiration always moves closer to the average performance level of the group.**

To avoid the few athletes who are considerably above the others in ability to set their level of aspiration lower than it actually is, a good coach will discuss goals with them early in the season and periodically during the season, in an attempt to keep them at a high level of aspiration.

5. **A person does not evaluate his abilities with others too divergent from himself.**

From the foregoing it can be seen that a high level of aspiration may represent a direct expression of a goal, an incentive to perform better, or a means of protecting the ego. A low level of aspiration may express an objective judgment, a method of avoiding tension, or a way of avoiding the appearance of failure. There is some evidence that a strong leader can alter the level of aspiration of a group which may have set their sights too low.

Stress and Anxiety

In coaching today, stress and anxiety are becoming important traits to consider because they have such a great influence on performance.

The sources of stress are perhaps best described by Reuben Frost:

> **"Stress normally causes a state of anxiety. Stress can be of many kinds. As previously mentioned, certain emotional states can act as stressors and lead to anxiety. Fear, anger, love, agony are examples of these. Criticism, disparagement, and punishment with accompanying anger and guilt feelings often develop into a stressful situation. Too many defeats, impending defeat and failure, and loss of esteem and status can be stressors. Ambition, a strong desire to win, or the desire to please a loved one can be equally stressful.**
>
> **"Stress can be imposed from within or can be the result of outside influences. A tremendous desire to achieve or pressure exerted by the coach or the alumni can act as stressors and produce an anxious state. It often happens that players and coaches put pressure on themselves even though there are no real outside pressures."** [3]

Each athletic contest is a stressor and normally produces some anxiety, both for the coach and the contestant. Research has shown that apparently there is an inverted U-shaped relationship

between anxiety or stress and performance (see Figure 1).

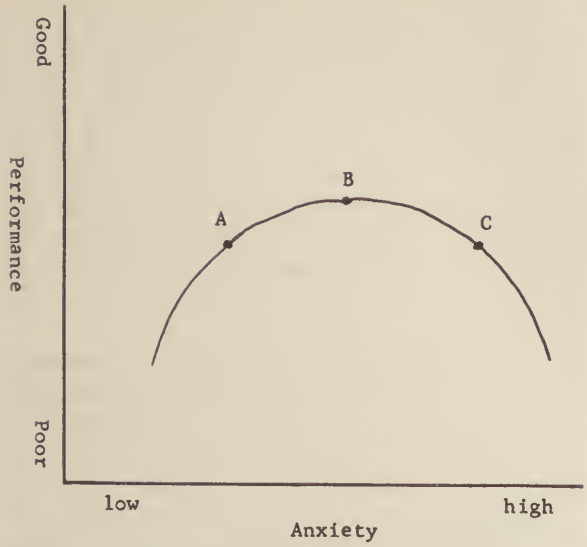


Figure 1: Relationship between anxiety and performance.[9]

If anxiety is low, the performance is poor. As anxiety increases, performance continues to increase, but then levels off. A continued increase in anxiety results in an increasingly poorer performance.

Individuals differ in their reaction to stress. Thus, each athlete has his own anxiety curve. When all persons were treated alike, psychologists looked for the highest average performance. When psychologists tried to raise the average performance, they began to treat each individual differently. I am saying that we cannot treat all athletes alike by giving a general pep-talk. The athlete at point "A" on Figure 1 has a low level of anxiety. To him, the game is just another game; he does not get excited about it. This athlete will be below the optimum performance level of anxiety and thus needs a pep-talk to get him to point "B". Another athlete, perhaps, has been in a state of anxiety because of the recent failure of an examination, and this stress, along with the stress of the contest, places him at point "B" on Figure 1 or at the optimum performance level of anxiety. For the third athlete, who has been under stress all week caused by a problem at home, the contest causes him to go beyond the optimum performance point (ie, at point "C" on Figure 1) on the anxiety scale. For this athlete the coach should use a pep-talk to calm him and relieve or lower his anxiety. It should be apparent that what is a stressor for one athlete may not be for another, and that each individual will respond differently to different stressors.

Although there are several scales for assessing the level of anxiety in an individual, probably none are as effective as the subjective judgment of the individual by the coach. Observation of the athlete in a variety of situations will assist the coach in assessing whether the athlete needs to be calmed, left alone, or motivated.

Strange environments and experiences cause the effects of stress to be more deleterious. Becoming familiar with strange places and gradually introducing the stressor are effective techniques for reducing the deleterious effects of stress and anxiety.

Apparently, an individual can adjust to stress and increase his stress tolerance. Some research [10, 11] has indicated that the champion athlete is always at the optimum performance anxiety level (at point "B" on Figure 1) regardless of the importance of the contest. These athletes have learned to adjust and control their anxiety. Other research [12] has indicated that champion athletes have more emotion and do not have complete control of that emotion. I believe a coach should train his athletes to control anxiety and stress as carefully as he trains them for endurance. The techniques for accomplishing this objective are lacking, but progress is being made every day.

One other point should be mentioned here. Evidence indicates that as emotion increases, functioning intelligence decreases. When an athlete loses control of his emotions he should be removed from the game or contest immediately, especially if the success of the team depends upon the clear thinking of this individual. How many of you have become so enraged at the officials that you go beyond the point where you can think (perform) rationally, and thus make the wrong decisions and lose the game? Obviously, stressors also affect the coach and his decisions.

A summary of the above can best be done by again quoting Reuben Frost:

> **"Anxiety results from a summation of stressful influences and the coach must be aware of the total pattern of pressure impinging on an individual. Problems at home, successive defeats, recent failures in school or in athletics, may be already causing so much anxiety that the coach's role must be one of alleviating, rather than adding to stresses imposed."** [3]

Fear of Success

The empirical evidence for this phenomenon is somewhat lacking. However, if one reads the case studies in Beisser's book entitled *The Madness in Sports,* and analyzes Ogilvie's and Tutko's paper entitled "The Unconscious Fear of Success", it becomes apparent that for some athletes there is a real fear produced as a result of winning. Thus, we have the great athlete who suddenly chokes when victory is within his grasp.

There is considerable evidence that many individ-

uals, after attaining a lifetime goal, suddenly become very depressed and, in some instances, have attempted or succeeded in self-destruction. This is analagous to winning or being the national or world champion. What are some of the factors that create the fear of success? In the unconscious, apparently defeating an opponent is the same as beating him physically, and depending upon past experiences, may cause considerable guilt.

The fear of aggression is probably learned early in childhood. Corporal punishment or withholding love for an act of expressed aggression influences the growing child, teaching him to consider the consequences before aggressing. Thus, the child develops stop and go signals for his behavior and, as a result, is stopped from aggressing on the field of play by his sense of guilt. Winning, therefore, in the unconscious, is tantamount to destroying the opponent. Through defense mechanisms, the champion is able to deny winning. He turns his aggression upon himself, the officials, the crowd, or in some other way overcomes the unconscious concomitants of winning. This may explain why the real superchampion in some sports is introverted.[4]

According to Ogilvie and Tutko in their paper, "The Unconscious Fear of Success",[7] there are five syndromes which may prevent the highly physically skilled individual from becoming a champion.

1) He develops a growing sense of social and emotional isolation. As the athlete becomes more successful, there appears to be a form of increased resentment by his former friends. These individuals are gripped with the unconscious fear that the successful individual will outgrow the necessity of their friendship, and unconsciously they create situations which they use to confirm their convictions, and eventually they will be rejected. The sweetheart or wife is often the first one to feel this rejection. The athlete is spending more time at his sports than with his wife, and thus, when the athlete is in greatest need of some form of emotional support, he finds that it is being withheld. Further substantiation of isolation exists in the quote, "the crowd's cheers for the underdog are soon lost if one becomes the champion".

2) He develops guilt feelings about self-assertion or overt aggression. According to Ogilvie and Tutko, "almost every truly great athlete we have interviewed during the past four years, representing every major sport, has consistently emphasized that in order to be a winner you must retain the killer instinct. Each of these men had to discover for himself that winning takes an aggressive dominant spirit. Each found that he had to be emotionally free to become self-assertive and not be haunted by conscious or unconscious fears that such behavior may cause him to be socially rejected." [7]

3) He habitually rationalizes in order to protect himself from having to face the reality of true physical potential. An athlete who uses excessive rationalization dares not face the reality of his true potential. Rewards or recognition for success, for the most part, have been absent from his social training. Parents have set the standards, and any performance short of these standards has been treated as failure. An athlete, with this "hang-up" of rationalization, must avoid the conscious experience of failure, thus he develops self-deceptive ways of justifying the quality of his performance. At all cost he must avoid the test of his true potential in order to avoid failure.

4) He creates unconscious feelings of resentment as a reaction to exaggerated external demands for excellence. Once he attains the championship, he finds himself in the position of being a potential failure for the rest of his athletic life. He must live up to the expectations of not only his parents, but also the crowd. Every time he performs he is expected to attain his previous record or set a new record, thus unconscious feelings of resentment develop against these exaggerated demands.

5) He develops an unconscious fear of old traditions or old idols. Records and athletic standards become awe-inspiring to many a young athlete, and as a result he sets his motivation over a period of years in pursuit of these goals. In addition, he frequently selects the top performer as his personal idol, that is, the person he desires most to be like when he grows up. If he is to exceed the goal of his idol, he must develop an arrogance toward the old idol in order to attain the prize he has sacrificed to obtain.

A few recommendations may be in order if you, as a coach, are going to overcome the foregoing success-phobia reaction in your athletes.

Ask your athletes to think of these recommendations as ways to overcome this unique form of fear. Ogilvie and Tutko [7] have made the following recommendations:

1. Ask yourself if your devotion to your sport is a healthy one. . . . Can you play the game for the sake of the game itself? You must constantly remind yourself that playing and winning does not prove a single thing about you as a human being except that you are excellent in one sport. It does not prove that you are any more lovable, desirable, bright, worthwhile, or a success in any other area of life. . . .
2. Remember that as the individual moves up the ladder of success there will be a tendency for him to become more isolated from his peers. Often this is caused by the time requirements associated with high achievement. . . . While they were developing together, no particular threat was present, but as soon as the athlete begins to excel and outstrip his team-

mates it is possible to sense a change. . . . Should this growing feeling of isolation begin to bother your athlete, remind him that his former associates must have more frequent signs that they are still important in his life. It would even be wise to have him express in some verbal way to these friends that he is actually sensing a loss of personal closeness.

3. The young athlete who is achieving at an exceptional level must be conscious of the inclination that others will have to place him in some special category as a human being. . . . The public may demand that he conform to standards of what they expect him to be and will severely punish him should he ever deviate from the expected role of "hero". The ability to retain perspective can be increased greatly by teaching him the gentle art of laughing at himself in those areas where he falls short of greatness.
4. It is most important that he share with his wife, girl friend, or sweetheart as early as possible the nature of the sacrifices that will be a part of unusual success. If he can anticipate many of the problems and explore them in some constructive form, much of the misunderstanding will have been eliminated. . . . She should be reminded that her emotional support is fundamental to his continued success. It is my opinion that thousands of great careers in athletics have been ruined by the conflicts created by this threat and its consequent miscommunication.
5. The athlete forging to the top must be schooled to accept the reality that winning is a selfish pursuit. This will require that he develop powers of concentration that will enable him to shut out any and all distractions. . . . He must learn to put on emotional and mental blinders to control any possible distractions. Once he learns to create his own personal emotional isolation chamber he will be freer for physical excellence. Turning away momentarily from his need for personal support of friends is one of the most important emotional needs he must forsake. . . . Winning is much like death because it is something which you must do alone.

Vanek,[13] psychiatrist for the Czechoslovakia Olympic Team, has indicated that it is foolhardy to carry on a conversation with an athlete prior to his event. Each athlete is going over a mental picture of what he is going to do, and a verbal description of the skill will disrupt this mental image and perhaps cause him to perform poorly.

In summary, it should now be apparent that there are many external and internal psychological problems which will effect the athlete's performance. Aggression, anxiety, motivation, level of aspiration, self-confidence, courage, emotional state, tolerance of pain, proper state of mind, fear of failure or fear of success, and self-esteem are some of the factors related to performance.

However, I would like to warn you that you will be greatly disappointed if you believe that you can now label the psychological hang-ups of your athletes and then expect some miraculous change in their performance. Try to understand the personality of your athletes, then you will be able to strengthen and train them in combatting all of their weaknesses, not just the physical. Best of luck!

your medical faculty at work

by John Sargeant
Executive Director

The Council met on Thursday, June 18, 1970, and took the following actions:

1. Waived dues of an ill member; agreed to refund one half of the annual dues paid by a member who has been ordered to Vietnam; and agreed to recommend to the House of Delegates an Emeritus Membership for another member. All of these requests came from the Montgomery County Medical Society;

2. Accepted the Budget Statement and Dedicated Fund Statement through April 30, 1970;

3. Approved the Medical Economics Committee's recommendation to raise the rates for Professional Liability coverage in Maryland as requested by the St. Paul Companies. The letter of recommendation is as follows:

The Medical Economics Committee is, among other things, charged with reviewing the Faculty sponsored Professional Liability program on an annual basis and making any recommendations involved in this regard.

At the May 5, 1970 meeting of the committee, representatives of the St. Paul Companies were present to discuss the experience of the program from its inception through December 1969. The data presented were interesting and . . . somewhat discouraging. However, when it is realized that other state programs, and rates in other communities are still considerably higher than Maryland's, we should perhaps not take this too much to heart.

As you are aware, rates for this type of insurance have been increasing by leaps and bounds. In addition, the Federal Government has expressed concern over the escalating premiums and the increasingly common knowledge that many insurers are simply refusing to underwrite this category of insurance. We are at least fortunate that a program is still available to the Faculty membership and at a rate that is less than those in other states. Maryland, currently, has the eighteenth lowest rate in the country.

After a careful examination of all the data involved in this matter, it has been ascertained that the current loss ratio is 1.189, compared to a break-even point, at which the company can make a profit, of .621. You can readily see that the company is looking seriously at this problem and is trying to determine what should be done. The only possible solution is a rate increase. No company can continue to stay in business on a loss basis

The history of the program, since its inception in 1960, is as follows:

1963		8%	decrease in premium
1965		6%	decrease in premium
1967		9%	increase in premium
1968	(March)	18.9%	increase in premium
1969		19.4%	increase in premium plus increase in basic of 25%

In each of these increases, the National Bureau change has been higher than the Maryland increase. Maryland's rates are substantially lower than the National changes and the Bureau rates for Maryland.

The Medical Economics Committee, after carefully weighing all the factors in the matter and recognizing that the company can readily withdraw from writing insurance in this field, making its availability virtually nonexistent, recommends to the Council that the changes shown (below) be approved and the State Insurance Commissioner be so advised.

It is pointed out that other changes in the policy are also being made. The following items will be required to be included by the policyholder when he purchases professional liability insurance:

Office Premises Liability
Medical Payments Liability for Office Premise Coverage
Medical Payments Liability
Personal Injury Liability

In addition, the company proposes to make available, on an optional basis, a new type of coverage called "Defendant's Reimbursement Liability." This would provide payments to the physician, for any appearances he makes in court in defense of any case filed against him, of up to $200 a day, with a limit of $5,000. This is meant to reimburse him for the time lost from his practice, money which he would not be earning because of such lost time.

The Medical Economics Committee trusts the Council will approve this proposed rate increase by the St. Paul Companies, effective July 1, 1970.

For $100,000/$300,000 coverage, physicians have to pay:

	California	Connecticut	Maryland (proposed)*	Current Maryland
Class I	573	251	163	96
Class II	912	440	287	168
Class III	1,658	1,270	489	287
Class IV	2,106	1,588	653	383
Class V	3,452	1,588	816	479

** Maryland rates through the Faculty's program only.*

4. Authorized the Medical Economics Committee to develop protocol in regard to the following two suggested projects, report to the Executive Committee, and appropriate the necessary funds to implement the projects:

a) employ an actuary or consultant to develop statistical data on professional liability actions in the state, the outcome of the cases—whether or not such actions are justified, and to collect related data

b) employ an actuary on a consulting basis to analyze the data on premium income, reserves, administrative costs, etc., provided by the St. Paul Companies to the committee, in order to ensure the recommendations made to the Council are proper;

5. Authorized the Medical Economics Committee to arrange a meeting with members of the Blue Shield Board to discuss mutual areas of concern. Representatives from the Faculty will be the Executive Director, and the chairmen of the Medical Economics, Professional Medical Services, and Peer Review committees;

6. Heard an additional progress report of the Medical Economics Committee's study of alternatives to the present system of handling professional liability cases. The report indicated that it would be impractical to adopt the method used in workmen's compensation cases. The committee is continuing to study this problem;

7. Authorized the Program and Arrangements Committee to investigate alternate sites for the 1971 Annual Meeting. The Executive Committee is now empowered to act upon the committee's recommendations;

8. Endorsed the use of the facilities of the El Conquistador Hotel in Puerto Rico for a portion of the 1971 Semiannual Session;

9. Endorsed the concept of the Maryland Consortium for Health Sciences to develop a cooperative Health Manpower training program;

10. Approved the concept of a mop-up campaign for the mass Rubella Vaccination program;

11. Heard the Peer Review Committee's report on hospital utilization and endorsed further study and a report on the committee's pilot program in this regard. This will enable the committee to investigate all aspects of the pilot program, consult with other interested groups, and seek possible sources of funds to underwrite the program;

12. Also heard from the Peer Review Committee that it has contacted the State Board of Medical Examiners in regard to testing the knowledge of examinees on proper billing for services and the quality of services offered;

13. Accepted a recommendation to support education of the public in regard to the limitations of the Medicare program. The Council also referred this suggestion to the Public Relations Committee for implementation, with the proposal that the committee develop an educational pamphlet to be used by physicians throughout the state;

14. Endorsed the action of the Executive Committee in expressing displeasure with the State Department of Health and Mental Hygiene's proposed agreement which would be signed by all providers of health care services under the Medicaid program. It also authorized the committee to take the appropriate action should the department proceed with this proposal;

15. Discussed a motion adopted by the House on Friday, April 3, 1970, which reads as follows:

> The Faculty direct its members on the Blue Shield Board to work towards elimination of arbitrary restrictions on the number of visits a physician may make in treating his patients.

(Continued next page)

The Council was advised that there was an apparent misunderstanding as the actual wording of the directive referred to is as follows:

> Please be sure to include current medical diagnosis. Medicare regulations stipulate that payments be made only where there is clear medical necessity for the services being performed. As a general guide, when requesting payments for visits in excess of four a month, be sure that the diagnosis given reflects the acute condition being treated.

The House of Delegates will be so advised at the Semiannual Session;

16. Directed that the results of the recent Membership Survey be sent to the Policy and Planning Committee for its use in making future policy recommendations; and also directed that chairmen of committees affected by certain parts of the questionnaire be notified of its results in the specific areas of concern;

17. Voted to reaffirm action taken at the March 1970 Council session to oppose any change in the Professional Corporation laws to permit use of a corporate name without the name of a physician/incorporator in the title;

18. Tabled a request from the Emotional Health Committee that would have endorsed a construction grant application for a psychiatric unit in Montgomery General Hospital;

19. Referred to the Committee on Professional Medical Services a recommendation from the Committee on Emotional Health to establish a Faculty Committee on Health Care for the Poor, with consumer representation. The Committee on Professional Medical Services is directed to prepare a study and report on the subject;

20. Supported the intent of a resolution from the Committee on Emotional Health to call on medical schools to increase their enrollment; and referred it to an appropriate Faculty committee for study and report;

21. Adopted the following resolution, as amended, proposed by the Emotional Health Committee:

> Whereas, The Medical and Chirurgical Faculty of the State of Maryland has repeatedly gone on record supporting the concept of psychiatric units in general hospitals; and
>
> Whereas, In recent years the need for such services has been recognized with resulting federal and state funds being allocated for construction of facilities on the local level; and
>
> Whereas, Public acceptance of psychiatric treatment in the general hospital is currently sufficient to allow these services in the community, be it therefore
>
> Resolved, That the Medical and Chirurgical Faculty of the State of Maryland endorses the concept that general hospitals of over 100 beds include beds for the care of psychiatric patients.

22. Approved appointment of the following committee to work with a similar liaison committee of the local AFL/CIO:

> John F. Schaefer, MD, President-elect
> Charles F. O'Donnell, MD, AMA Delegate and Blue Shield Board Member
> Lewis P. Gundry, MD, Mediation Committee Chairman
> Robert J. Thomas, MD, Council member
> Charles W. Kinzer, MD

23. Approved cosponsorship of a Workshop on Child Abuse which is being developed by the State Department of Social Services;

24. Requested Council members to submit names for possible appointment by the AMA Board of Trustees to the following AMA Committees:

> Council on National Security
> Council on Scientific Assembly
> Committee on Medicine and Religion
> Committee on Transfusion and Transplantation

It also authorized submission of the name of Russell S. Fisher, MD, for reappointment to the Committee on Transfusion and Transplantation, and other names it submitted last year for similar appointment;

25. Voted to defer action in connection with a policy decision on adoption of a Relative Value Scale since this is under study in the Professional Medical Services Committee;

26. Determined that *properly prescribed drugs* should be paid for under the Medicaid program and declined to concur with a proposal by the State Department of Health and Mental Hygiene to restrict prescriptions for certain types of drugs for certain conditions;

27. Agreed to ascertain if anything is being done on a national level with the legality of the Social Security Administration's directing of fiscal intermediaries on how to determine usual and customary fees. Authorized the Executive Committee to proceed further in challenging this matter, if it deemed it appropriate;

28. Authorized contact with the Governor and Secretary of Health and Mental Hygiene to point out that the medical profession has contributed greatly to the solvency of the Medicaid program by accepting substandard fees for many years.

This emblem means a lot to you. It means more to your patient.

This is the symbol of Medical Equipment Unlimited pharmacies . . . source of complete lines of medical, therapeutic and convalescent aids . . . staffed with personnel expertly trained in the art of fitting these aids. An important service, both to members of the medical profession and their patients.

Tabulated Results of the Faculty's Survey

Although questionnaires are still dribbling in, we feel as though we now have the bulk of those that are to be returned. Out of a total membership of 3,976, 1,161 members took the time to fill in the questionnaire and return it to the Faculty offices. This is an excellent return—better than 25%—which anyone who has conducted such a survey can tell you is above average.

The results are as follows:

Please indicate your awareness of the Faculty's activities in the following areas:

	Fully Aware	Not Aware	No Opinion
1. Legislative activities on a state level, such as offering constructive legislation for the protection of the public, and opposition to legislation which infringes on the practice of medicine.	967	125	58
2. Presentation of panels to hospital medical staffs on malpractice pitfalls.	445	628	67
3. Availability of legal defense in the event of alleged professional liability, and provision of expert witnesses in this regard.	946	69	20
4. Peer review activity in connection with:			
a) Medicare & Medicaid claim forms	565	466	92
b) Utilization review activities	578	379	111
c) Adjudication of fee disputes	694	275	96
d) Determination of usual, customary and reasonable fees under Major Medical policies	623	358	82
e) Determination of ethical actions and initiation of disciplinary actions where warranted	945	143	59
f) Adjudication mechanisms between attorneys and physicians	482	445	82
5. Cooperation with various other professional groups:			
a) Bar Associations	698	261	105
b) Dental Societies	631	315	117
c) Pharmaceutical Association	631	327	116
d) Nursing Home Association	597	361	126
e) Hospital Council	724	258	98
f) Nurses Association	622	333	128
g) State and local governmental agencies	760	214	90

In the educational area the Faculty, as well as other groups, conducts continuing educational programs. Your answers to the following questions will assist us greatly in formulating plans for the future.

6. In the past year I have attended a scientific meeting of the following:	
The Medical and Chirurgical Faculty	608
The American Medical Association	219
Postgraduate Education Seminars (Med-Chi's)	281
Medical Aspects of Sports	
Viral Disease Symposium	
The 20th Century Adolescent	
My Statewide Specialty organization	594
My National Specialty organization	635
Voluntary Health organization	178
MEDIC (Medical Education's Dedicated Instructional Channel)	266
7. I read *regularly:*	
The Maryland State Medical Journal	895
The Journal of the American Medical Association	633
My specialty medical journal(s)	938
New England Journal of Medicine	288
Medical World News	610
Medical Times	364
Medical Economics	733

8. With respect to Medical Representatives of Pharmaceutical Companies, I find:

	Frequently	Occasionally	Never
a) I talk with detail men	622	427	98

b) I prefer to see such individuals:

before office hours	83
after office hours	99
during office hours	577
by appointment only	273
by request only	78
at my convenience	383
for 2 to 5 minutes	438
for 5 to 10 minutes	303
for longer than 10 minutes	44

	Frequently	Occasionally	Never
c) at exhibits at the Faculty's Annual Meeting	339	387	150

d) I believe that presentations of detail men are:

completely honest	82
usually honest	628
dishonest	17
completely adequate	54
adequate	718
inadequate	119
extremely valuable	68
valuable	652
of no value	118

e) I believe that the representatives:

are well educated	130
are adequately educated	663
are inadequately educated	109

	Yes	No
should have accreditation	502	362
should be licensed	301	532
should be required to have continuing education	786	142
should discuss one product only	177	
should discuss 1 to 2 products only	591	
should discuss all products	138	

f) Product samples:

amounts left are excessive	171
amounts left are adequate	601
amounts left are insufficient	52
should be left at request	841
not at all	20
only items discussed	97
should be increased	162
should be decreased	204
should be discontinued	88

g) Samples left are:

used for all patients	558
used for new patients only	45
used for indigent patients	423
used not at all	66

9. Use of Faculty services and facilities:

	Frequently	Rarely	Never
a) Library: I use the facilities of the library, or	97	574	457
visit library personally	52	486	480

b) Insurance Programs:
I participate in the various insurance programs *offered by the Faculty*

Professional Liability (St. Paul Companies)	647

Business Overhead Expense (St. Paul Companies)	184
Health and Accident (Hartford Insurance Co.)	399
Major Medical (Hartford Insurance Co.)	304
Life Insurance (Minnesota Mutual)	95
Blue Cross & Blue Shield	677
Med-Chi Members Retirement Plan (Keogh)	167

c) Educational Seminars I have participated in:

Office Assistant training session	184
Public Speaking training program	65

	Satisfactory	Not Satisfactory
d) Economic Matters: Negotiation with Third Party Carriers in connection with fee payments is	351	429

	Yes	No
The use of a trained "negotiator" would improve this current picture	503	170

	Adequate	Inadequate	Of No Value
e) Physician Placement services to communities and physicians are:	199	316	114

The general comments written at the end of the questionnaires indicated that the categories of "fully aware", "not aware" and "no opinion" have little to do with the "wishes" of the membership. Other comments were that the Med-Chi is too Baltimore oriented; the questionnaire was poorly designed; questionnaires should be sent out more often and they should be shorter.

Some of the questions, especially the one concerned with Faculty insurance programs, appear to have been misinterpreted. On the whole, however, the results of the questionnaire were satisfactory and will serve as a guide in reevaluating budget requirements, services, and the effectiveness of certain programs.

Relax and Enjoy Receiving Our Regular Checks

The Credit Bureau is your best bet on your Collection problems.

Most doctors prefer a collection service that is not conspicuous. The public accepts the Credit Bureau as a community collection medium. We have a long time reputation for ethical operation.

Every account referred for collection becomes a part of the credit record. When your patient "skips" and leaves no trace, frequently we can locate him and reach him wherever he moves. Our affiliation with over 1500 offices in the United States makes this possible.

And remember, you pay only for results. These are some of the reasons we say "Relax and Enjoy Receiving Our Regular Checks."

Medical Library Association Conference—1970

I recently attended two important library association meetings—The Medical Library Association meeting in New Orleans in May and the Special Libraries Association meeting in Detroit in June.

On the first evening in New Orleans, the rain drenched anybody going out for dinner or a glimpse of the French Quarter. Nevertheless, Bourbon Street was teeming by ten o'clock and we, along with the other tourists, conventioneers, and high school graduates ventured out for a view of this fabulous street.

The meetings began Monday with continuing education courses on Implications of Machines in Libraries, General Biomedical Reference Tools, Human Factors in Medical Library Administration, Computers and Programming, Quantitative Measures as Management Tools, and the Literature of Dentistry.

The welcome party, "A Night in Old New Orleans", featured costumed belles and beaus of early New Orleans standing in the receiving line and greeting guests around the ballroom floor. Refreshments graced the tables and the Louisiana hospitality overflowed.

The first general session began with a welcome from Miss Mary Louise Marshall, Librarian Emeritus, Rudolph Matas Medical Library, Tulane University School of Medicine, New Orleans. Miss Marshall was also Honorary Chairman of the Conference Committee. The presidential address, "Plant a Seed", was given by Elliott H. Morse, Librarian, College of Physicians of Philadelphia. The final official and inaugural address by Donald Washburn, DDS, President, Medical Library Association, 1970-1971, was entitled "Sharpen the Ax". There was some speculation concerning the significance of the two titles.

The Medical Society Group was fortunate in having Alton Ochsner, MD, as speaker for its dinner meeting. His praise for the services of medical librarians throughout his career certainly inflated our egos.

The members attending the conference are indebted to the Abrahams Magazine Service for a sumptuous cocktail party which preceded the Tuesday evening meetings, and the Plenum Publishing Corporation for furnishing the Preservation Hall Musicians as banquet entertainers following the program on "New Orleans Funeral Music".

For details of specific meetings, watch for the proceedings in the *Bulletin of the Medical Library Association.* The proceedings of the 1969 meeting in Louisville appear in the April issue of the *Bulletin.*

A review of the Special Libraries Association meeting in Detroit will be included in September.

NEW ACCESSIONS—BOOKS

(Arranged by author and title)

Alexander, Raphael
Sources of medical information; a guide to organizations and government agencies which are sources of information in fields of medicine, health, and related areas, and to currently available pamphlets, reprints, and selected scientific papers. Arranged by subject. Edited by Raphael Alexander. New York, Exceptional Books [1969].

American Public Health Association.
Control of communicable diseases in man. Abram S. Beneson, editor. New York, 1970.

American Public Health Association. Committee on Medical Care Administration.
A guide to medical care administration. [New York] 1965-69.

American Public Health Association. Committee on Population and Public Health.
Family planning; a guide for state and local agencies. New York, 1968.

American Public Health Association. Subcommittee on Occupational Health.
Local health official's guide to occupational health. New York, 1968.

Anglesio, Enrico
The treatment of Hodgkin's disease. New York, Springer-Verlag, 1969.

Atkins, G.
Multicompartment models for biological systems. London, Methuen [1969].

Barber, Hugh R.
Are the pills safe? By Hugh R. K. Barber, Edward A. Graber, and James J. O'Rourke. Springfield, Ill., Thomas, 1969.

Barry, Hugh C.
Paget's disease on bone. Edinburgh, Livingstone, 1969.

Bowers, Warner Fremont
Emergency medical technician examination review book. Flushing, N.Y., Medical Examination Pub. Co., 1969- .

Caine, Thomas M.
The treatment of mental illness; science, faith and the therapeutic personality. By T. M. Caine and D. J. Smail. New York, International Universities Press, 1969.

Caird, Francis I.
Diabetes and the eye. By F. I. Caird, A. Pirie, and T. G. Ramsell. Oxford, Edinburgh, Blackwell Scientific, 1969.

Carrell, James A.
Disorders of articulation. By James A. Carrell. Englewood Cliffs, N.J., Prentice-Hall, 1968.

Chapman, Arthur Harry
The physician's guide to managing emotional problems. Philadelphia, Lippincott [1969].

Conference on Head Injury, Washington, 1969.
The late effects of head injury. Edited by A. Earl Walker, William F. Caveness, and Macdonald Critchley. Springfield, Ill., Thomas [c1969].

Dalrymple, Willard
Sex is for real; human sexuality and sexual responsibility. New York, McGraw-Hill [1969].

Dauer, Carl Calvin
Infectious diseases. By Carl C. Dauer, Robert F. Korns, and Leonard M. Schuman. Cambridge, Harvard University Press, 1968.

Davison, Wilburt Cornell
Davison's compleat pediatrician. Edited by Jay M. Arena, with collaboration of 15 contributors. 9th ed. Philadelphia, Lea & Febiger, 1969.

The Diagnosis of bleeding disorders. By Charles A. Owen, Jr. [and others]. 1st ed. Boston, Little, Brown [1969].

Douglas, Emily Taft
Margaret Sanger; pioneer of the future. 1st ed. New York, Holt, Rhinehart and Winston [1969, c1970].

Drugs in current use and new drugs.
1970- . Edited by Walter Modell. New York. Springer, c1970- .

Duffy, Benedict J.

The girth control pill

Tepanil® Ten-tab

(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause *CNS effects* such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic *cardiavascular effects* reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. *Allergic phenomena* reported include such conditions as rash, urticaria, ecchymosis, and erythema. *Gastraintestinal effects* such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytasis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

NEIL SOLOMON, MD, PhD, SECRETARY

Maryland State department of health and mental hygiene

The National Scene

The cost of patient services in state- and county-operated mental hospitals in the United States in 1969 was nearly $1.75 billion.* This figure exceeded the total budget of Maryland and all but a few populous states. It reflected an increase of $162 million, or 10.2%, over the previous year's comparable figure. In Maryland and in most states, expenditures have risen every year in the last decade and have doubled since 1959.

Daily costs per patient have risen proportionally faster than total expenditures, because of the decline in the average number of persons hospitalized. Since 1959, this figure has decreased 3.5% a year nationwide (from 542,135 to 378,633) and 1.9% in Maryland (from 8,952 to 7,451). Because of these two interrelated factors, the average daily cost of caring for one patient in all states rose 11.4% annually during this ten-year period (from $4.29 to $12.59). Maryland, with a reported daily per patient expenditure of $12.50, has had an annual increase of 10.3% since the $4.69 noted in 1959. The state currently ranks 28th, between the high of $38.93 for Alaska and the low of $5.40 for Mississippi. It ranked 16th in 1959.

FISCAL YEAR	AVERAGE SIZE OF PATIENT POPULATION	NET LIVE RELEASES	TOTAL EXPENDITURES	EXPENDITURE PER NET RELEASE
1959	542,135	176,411	$ 849,493,595	$4,815.42
1964	496,661	268,616	1,144,024,206	4,258.96
1966	460,910	308,636	1,300,380,295	4,213.31
1968	412,818	351,461	1,577,631,758	4,488.78
1969	378,633	374,383	1,739,293,258	4,645.75
PERCENT CHANGE (1969 vs. 1959)	—30.2	+112.2	+104.7	—4.5

While these data reflect rising personnel-patient ratios, the current emphasis on psychopharmacology, and other innovations in treatment services, they are primarily related to the rapidly increasing patient turnover. This turnover results from shortened periods of hospitalization for all categories of new admissions and the transfer of long-term patients to nursing homes. In Maryland, as elsewhere, more patients are treated each year even though the average population size is decreasing and réleases have more than doubled since 1959. In fact, this latter rise has been so large that the average expenditure required to produce one net release is now less than it was ten years ago.

If present trends continue, the average daily cost per patient must be expected to rise 10% or more a year even though the average total cost of each episode declines further. The only alternative to continuing, uninterrupted increases in state psychiatric hospital expenditures is to drastically reduce the size of the patient population by 1) providing community-centered programs as an alternative to hospitalization, 2) further decreasing the average length of hospitalization, 3) transferring chronic, custodial patients to nursing home type facilities, and 4) developing and expanding after-care services for released patients. Maryland is now seeking to accomplish this through a closely coordinated and centrally directed program offering a variety of community and hospital services to the mentally disturbed and through the implementation of current and new concepts for the prevention of mental illness.

** Office of Biometrics, National Institute of Mental Health, Provisional Patient Movement And Administrative Data-State And County Mental Hospitals-United States-July 1, 1968-June 30, 1969.*

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, MARYLAND STATE MEDICAL JOURNAL, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a maximum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the JOURNAL. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with JOURNAL style.

Statements made or opinions expressed by any contributor in any article or feature published in the JOURNAL are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

Baltimore City health department

Smoking and Health

As the years pass, the evidence of the close relationship between cigarette smoking and such respiratory ills as emphysema, chronic bronchitis, and lung cancer continues to accumulate. It is particularly strong in relation to lung cancer. In Baltimore city, from 1950 on, the trend has been upward, from 186 deaths in 1950 or 19.6 per 100,000 population, to 451 deaths in 1969 or a rate of 49.7 per 100,000 population.

At the same time, the death rate for chronic bronchitis and emphysema—although much lower than the rate for lung cancer—almost doubled, with 8.8 deaths per 100,000 in 1960 and 1961 compared to 17.1 for 1968 and 1969. In addition, emphysema stands second among disability claims, according to officials at the Social Security Administration.

A look at lung cancer deaths in the age group from 25 to 44 years shows a 94.7% change from 5.7 per 100,000 population in 1960 and 1961 to 11.1 for 1968 and 1969. An increase of 21.9% was manifested in the same period for the 45 to 64 year age group and an almost 50% increase for those 65 years and older.

The 1969 statistics show the greatest number of deaths in the most productive years. From age 40 to age 75, there were 387 deaths out of a total of 451 cases for the year. Lung cancer today in Baltimore leads all cancer deaths. It is followed by cancer of the intestine with 205 deaths in 1969 and cancer of the breast with 157 fatalities last year.

tuberculosis

The Public Health Tuberculosis Clinic— Its Place in Comprehensive Health Care

JOHN A. SBARBARO
Director, Disease Control
Medical Coordinator
Denver Neighborhood Health Program
Denver, Colorado

The public health tuberculosis clinic and the future of tuberculosis control are caught in the present turmoil surrounding the organization and delivery of medical care in the United States. To understand the importance of the tuberculosis clinic, much can be learned from the past.

After the bacterium causing the disease was identified, Biggs [1] called for free dispensaries to be the focal point of tuberculosis control in New York. All ambulatory patients were to be provided with constant medical supervision, free medicine, and free food. Flick and Francine, turn-of-the-century leaders, emphasized preventive outpatient procedures while developing the Phipps Institute Dispensary in Philadelphia.[2, 3] Joseph H. Pratt, MD, of the Massachusetts General Hospital, culminated early outpatient efforts with his intensive home care program.[4, 5]

During the first quarter of the century, the practice of medicine began to shift from the bedside to the office.[6] Simultaneously, the number and scope of general medical clinics and outpatient departments increased from 150 in 1900 to 5,000 in 1925.[6, 7] In 1905, the newly formed National Association for the Study and Prevention of Tuberculosis emphasized the use of outpatient facilities for the protection from and control of tuberculosis. By 1915 these facilities had grown in number from 20 to more than 500.

In sharp contrast to the general clinics, which were outgrowths of charity, the tuberculosis dispensaries arose from a public health concern for centers for treatment, prevention, and health education. However, the declining rate of disease, the outbreak of World War I, and the isolation of many tuberculosis clinics from general medical outpatient services combined to reduce this voluntary endeavor.[8] Moreover, the major trend was toward hospitalizing patients with active tuberculosis because of the increasing belief in the value of prolonged bed rest. Hospital treatment of tuberculosis was dominant in the 1930's, and by the early 1940's, outpatient clinics, except for the pneumothorax clinics, were no longer important in the treatment of tuberculosis. The pendulum had swung from home and clinic to hospital in 50 years.[9]

Then, as knowledge of the natural history of tuberculosis increased and new forms of therapy became available, the pendulum began to swing back. With the discovery of streptomycin in 1944, PAS in 1946, and isoniazid in 1951, a debate started at the walls of the sanatorium. The studies of Wier,[10] D'Esopo,[11] Hirsch,[12] and Robins [13] demonstrated that patients could be treated effectively on an ambulatory outpatient basis. The public, accustomed to dramatic breakthroughs, believed that the problem of tuberculosis was solved but, unfortunately, tuberculosis clinics were unprepared for this responsibility.[14] Therefore, many patients turned to private physicians for care to avoid hospitalization.[15] McDermott noted that this change was unprecedented and unplanned, and he warned that widespread harm could arise from the injudicious use of chemotherapy by general phy-

Reprinted courtesy of the American Review of Respiratory Disease, *Volume 101, March 1970.*

sicians who had had no experience with the day-to-day decisions necessary in the treatment of pulmonary tuberculosis.[16]

In the face of the complex problems raised by the trend to home care by private practitioners, the need for long-term therapy, the lack of adequate clinics, and the rising concentration of an otherwise declining disease in the aged, the poor, and the uncooperative, the Arden House Conference was held in 1959.[17] The result was the landmark recommendation that state and local health authorities assume responsibility for ensuring the adequate treatment and rehabilitation of all patients with tuberculosis. In 1963, a Task Force reported to the Surgeon General the need for communities to build up clinic-centered tuberculosis control programs.[18] Thus, by 1967, under the stimulus of federal grants, tuberculosis clinics were made the primary responsibility of public health departments and, once again, had become the focal point for diagnosis, treatment, and control of tuberculosis.

However, they now face this responsibility in an era of increasing public apathy, a rapidly diminishing supply of specialists, a localization of the disease in poverty areas, and problems of financing. In their earlier years of dominance, tuberculosis clinics were well financed, but during the era of the sanatoriums the funds passed to these institutions and have remained there. The clinics now depend on federal funding for growth, and, occasionally, for their very existence. Worse, the clinics' problems are too often compounded by a long-standing lack of communication with the institutional system, and not infrequently by direct opposition from institution-based personnel.

Moreover, new clouds are gathering. We are in a decade of tumultuous change in the provision of medical care. Titles 18 and 19 eliminate the financial lure of free tuberculosis clinics, and might return to private practitioners that high-risk population that has characteristically been the responsibility of agencies. The trend to hospitalize tuberculosis patients in general community hospitals would support this movement. Further, Public Law 89-749, which demands that state governments play a larger role in the distribution of federal monies to large municipalities, combined with a cutback in federal funds, may effectively divert previously earmarked monies into other programs. This is further accentuated by the recognition of medical care as a right in the United States and by the resulting burgeoning of health care programs.

It might well be asked whether we need special tuberculosis clinics. The increasing emphasis on comprehensive health care appears to be in direct opposition to semi-independent tuberculosis clinics. The trend toward group practices and subspecialization of physicians strengthens the proposal of Robins [19] that tuberculosis clinics be incorporated into hospital-based chest clinics. However, if we have learned anything from history, it is that the public health tuberculosis clinics must continue to exist. This conclusion is supported by the current therapeutic situation, which requires facilities for short-term hospitalization and long-term outpatient follow-up, as well as the continued need for protecting the public health through the identification of active cases and the management of contacts. These may demand legal action at times.

In the past, both the sanatoriums and the general providers of medical care, including private practitioners, have had grave difficulties in fulfilling these requirements. The inpatient institution maintains its value by providing a site for isolation, close observation for reactions to medication, and education of patients. If incorporated into the total treatment of the patient, it can provide an opportunity to evaluate the reliability of the patient, as well as the social complex in which he will receive the bulk of his treatment. However, without adequate outpatient follow-up, the period of institutionalization, whether in a general hospital or sanatorium, has litle value.

The providers of ambulatory care face another problem. Even with the best intentions of the physicians and staff, the actual responsibility for care rests with the patient. In tuberculosis control, the responsibility for care rests with the clinic. Few outpatient departments or group practices, much less private physicians, have the capability of recalling patients, studying their reliability, or pursuing their contacts.

Next, the diminishing supply of tuberculosis specialists is intimately related to the overall problem. With the decision of Congress to discontinue assigning two-year medical officers from the Tuberculosis Branch of the National Communicable Disease Center to states and municipalities, a potential source of specialists was lost. The danger of the alternative —rotation of general medical residents through clinics based in health departments—is that later, as private practitioners, they might attempt to treat tuberculous patients in their offices, thus repeating the problems of 1953 through 1959.

It seems inescapable that the public health tuberculosis clinic is the only way of meeting all these needs. It must become the tuberculosis consultant and referral specialist for the entire medical community. This is true regardless of whether the patient is receiving his general medical care from the individual private practitioner (whether on a Title 18 or 19 or private pay basis), through prepaid or fee-for-service group practice, or through municipal health facilities. The clinic is the best way to husband the meager resources of personnel and money and the only way to fix responsibility on the providers of service rather than on the recipients.

To ensure the success of the clinics, a number of

steps should be taken. First, all groups working in the field of tuberculosis (voluntary and official, state and local, sanatoriums, and medical schools) must cooperate so that the best care will be found in these clinics. The clinics should be so effective and attractive that physicians will refer patients to them freely and that patients will readily accept the referrals.

Second, we need to ensure a supply of well-trained personnel. This can best be accomplished by incorporating some participation in public health tuberculosis clinics into all pulmonary fellowships under standards set by the professional societies, the medical schools, and public health specialists. The realistic use of federal money for training in tuberculosis could make this feasible.

Finally, let us not be diverted again by new and untried programs, nor return to methods that already have failed. We must insist that those responsible for the allotment of funds through federal grants, state planning agencies, and regional programs continue to recognize the utility and necessity of public-health-based tuberculosis clinics.

The Alcoholism Counselor in a General Hospital

CLARENCE W. HURLEY, JR.
Alcoholism Counselor
Mercy Hospital
Baltimore

Mercy Hospital is a "downtown" hospital. Its catchment area includes the "skidrow" sections of Baltimore, where there is a recognized need for assistance with alcoholics. The need for an alcoholism counselor, a nonprofessional but trained person in a general hospital, is a real and practical one. On February 9, 1970, I was employed as full-time alcoholism counselor at Mercy Hospital.

My immediate problem concerned the homeless, indigent alcoholics, and how to deal with them. These patients can be disruptive to a hospital's routine and disturbing to other patients. Some of them are loud and garrulous, and use abusive language. Others are withdrawn, disoriented, and difficult to communicate with. However, all these patients want and need help of some kind. My job as counselor is to provide that help and assistance when possible and, at the same time, to relieve the professional staff and other hospital personnel of the expensive and time-consuming task of serving the alcoholics.

The inpatients in the wards are one of my major concerns. Many of these patients are alcoholics or heavy drinkers with serious medical problems, and must be advised about the dangers of continued drinking. They are advised to come to me for counseling at the time scheduled for regular outpatient appointments. Some of these alcoholic patients need further treatment in a state hospital; others are referred to an alcoholism clinic, AA, or other agencies.

The expense of treating the alcoholic inpatient with other accompanying illnesses is high. The cost, on the average, is $82 a day, or approximately $2,000 for a 24-day hospital stay. The cost would be justified if the patient were permanently cured. But this is not the case if the patient continues to drink and returns to the hospital more seriously ill than before. It is my responsibility to try and break this cycle.

Patients are referred to me from many departments within the hospital. To establish the various sources of referrals, I kept records of every patient that I interviewed. By April 6, 1970, I had interviewed 50 patients.

Twenty-one patients were referred to me from the inpatient wards, 11 from the accident room-emergency department, 10 were "walk-ins" (not medical patients), 2 were employees, and 6 came from other sources.

This group of patients consisted of 48 men and 2 women.

According to age, 1 patient was under 25, 3 were 25 to 35, 8 were 35 to 45, 32 were 45 to 55, 5 were 55 to 65, and 1 was over 65.

Professionally, only 7 were skilled or semiskilled; 42 were laborers, part-time workers, or were unemployed; and 1 received social security benefits.

According to their residence status, 28 of the patients were homeless, 10 lived in single rooms, 1 lived in an apartment, 1 owned his own home, and 10 lived with a relative. Only 2 of the 50 patients were married and lived with their spouses; the rest were single, separated, divorced, or widowed.

It is too early to report on the success of my service. However, progress is being made in helping these alcoholics. Chronic alcoholics respond to a counselor's intelligent, understanding attitude, and this is what I try to give them. Each individual is treated as a distinct person with his own particular alcohol problem. I believe that my attitude toward all alcoholics, and my personal philosophy that everyone has another chance, will help to make this program a success in the future.

Vell, Dr. Cunningham! I was just telling Herbert I should talk to you about my allergy. Iirst my nose starts to tickle and..."

'u know the rest of the story. Sneezing. Watery eyes. Ry nose. And for prompt relief of these symptoms, re's Novahistine® LP. These continuous-release tablets e a vasoconstrictor-antihistamine formulation that ins working in minutes, then continues to provide ef for hours. Even when nasal congestion is due to eated allergic episodes, two Novahistine LP tablets, morning and evening, let most patients breathe freely all day and all night. Use with caution in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

Novahistine® LP decongestant

(Each tablet contains 25 mg. of phenylephrine hydrochloride and 4 mg. of chlorpheniramine maleate.)

DOW THE DOW CHEMICAL COMPANY Rx Pharmaceuticals Indianapolis

Clinical Extension of a pure Smooth Muscle Relaxant

TROCINATE®

Brand THIPHENAMIL HCl

400 mg./100 mg. S/C tablets

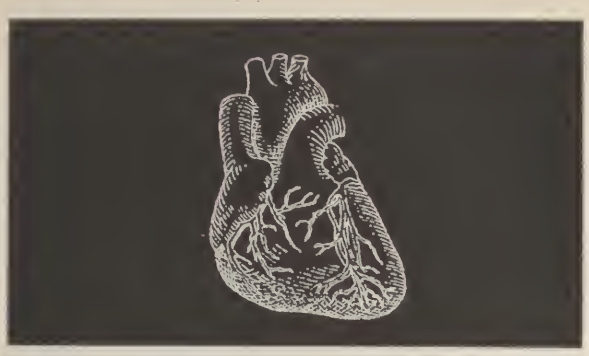
Trocinate relaxes all smooth muscles. Its direct action (musculotropic) does not involve the autonomic nervous system and it is not mydriatic. It is metabolized by the body and eliminated in the urine as harmless degradation products. Trocinate has a remarkable history of freedom from side-effects.

When a pure direct-acting smooth muscle relaxant is indicated, Trocinate is the drug of choice.

DIARRHEA (functional) . . . *the first 400 mg. tablet usually relieves the discomfort of diarrhea so promptly that it ceases to be a bother.*

DIVERTICULITIS—MUCOUS COLITIS . . . *the accompanying discomforts can be relieved by this direct smooth muscle relaxant.*

BLADDER SPASM . . . *relaxation is immediate. One or two tablets condition the bladder for cystoscopy in one hour.*



SPASTIC URETER . . . *the specific relaxing effect of Trocinate on the spastic ureter has been proven by animal studies and affirmed clinically. (J. Urol. 73:487-93)*

PRESCRIBING INFORMATION

WARNING: Do not give in advanced kidney or liver disease. PRECAUTIONS: Trocinate relaxes all smooth muscles. Large dosage or prolonged usage may cause feeling of weakness or can theoretically precipitate gall-bladder colic, due to relaxing the vascular and duct systems. Caution should be observed in patients with urinary bladder obstruction. DOSAGE: 400 mg. May be repeated in 4 hours. After relief, lengthen the dose frequency. (see side note)

NOTE: *The high therapeutic index of Trocinate permits its administration in dosage sufficient to relieve smooth muscle spasm promptly. 400 mg. dosage usually creates a therapeutic blood level. In reducing dosage after relief, lengthening the time between dosage rather than lessening the recommended dose is preferable. The prompt direct action allows a consciousness of the first suggestion of return of symptom . . . a guide to dose spacing and to determining when treatment is complete. A prescription for twelve or sixteen 400 mg. tablets will usually correct spasm and leave a few tablets for a reserve.*

Dietary Salt (Sodium Chloride) Intake and Arterial Hypertension: (Part) I

ELIJAH SAUNDERS, MD
Instructor in Medicine & Cardiology
University of Maryland School of Medicine

The possible association between salt intake and arterial hypertension has been a subject for discussion for a number of years. It is generally accepted that the level of blood pressure is determined by many factors, both constitutional and environmental. Lewis Dahl [1] found that habitual salt intake may be one important factor.

The Pathogenesis of Essential Hypertension could be expressed in a formula as follows:

A + B → Hypertension
A = Genetic Factor
B = Questionable dietary sodium
Decreased cadmium, decreased potassium
Cadmium/Zinc ratio
Water hardness (or lack of)
Tension (emotion)
Race
Obesity

Certain observations are worth noting as far as population groups are concerned. A number of people have observed a reduced incidence of hypertension in primitive races, with virtual absence among groups differing as widely in environment as Greenland Eskimos, Australian Aborigines, mountainous Chinese tribes, and Cuna Indians of Panama. Generally, it has been felt that the absence of hypertension among such people is due to their simple mode of living which is devoid of the strains associated with modern living. However, these primitive groups are not as strain free as one would expect because of the scarcity of the necessities for survival, the rigorous climates, sudden warfare, and the pressures of their social taboos.

Worth mentioning are some of the experimental data that seem to support the significance of salt in the diet and hypertensive disease. Studies of rats show that hypertension can be produced by feeding, or infusing, large amounts of salt, but the failure rate was 20% to 30%. Weller, of the University of Michigan, however, was unable to produce experimental hypertension after feeding rats salt for several years. Infusion of 1% saline to dogs produced hypertension which continued after reducing the sodium infusion. A certain number of these animals, and especially the rats, will go on to have a hypertensive disease process that seems to be quite similar, if not identical, to human essential hypertension.[2] In the dog experiments, there was not only an increase in blood pressure, but also an increase in cardiac output, stroke volume, and eventually an increase in peripheral resistance.

The experimental data also have been extended into the possible effects of other ions on hypertension produced by sodium. An interaction between sodium and potassium has been noted.[3, 4] There seemed to be a lower blood pressure response if the animals were fed an excess amount of potassium. An interaction between sodium and calcium also has been suggested, for the more calcium excreted

the more sodium was excreted. Rats on low calcium diets and fed normal saline developed slight hypertension, whereas those on normal calcium diets did not develop hypertension to the same degree, even when fed normal saline.

Hypertension may be more prevalent in populations in which there is an obligatory low calcium intake. In certain poor socioeconomic groups, in which there is a low intake of milk products, a possible relationship may exist in the high incidence of hypertension to low calcium intake. This may be particularly pertinent to the black populations of the South.

From the clinical point of view, what can one conclude about sodium in the diet and hypertensive disease? As early as 1929, it was postulated that low salt diet seemed to be found fairly frequently with normal blood pressure and the converse was likewise true. The observation that natural foods usually contained an increased amount of potassium and a decreased amount of sodium led to the conclusion that this may explain the low incidence of hypertension in the more primitive areas where natural food is consumed in fairly large quantities. The dietary habits of several populations around the world have lent much support to the belief that high salt intake can definitely be correlated with arterial hypertension.[3] The average salt intake of the Alaskan Eskimo is approximately 4 gm a day with a range between 1 gm and 10 gm a day. The Marshall Islanders of the Pacific area consumed an average of 7 gm of salt a day with a range of 1.5 gm to 13 gm a day. In the United States, in Brookhaven where Dahl's studies were conducted,[5] the salt intake was approximately 10 gm a day with a range between 4 gm and 24 gm a day. Most people quote the average American sodium intake as being between 10 gm and 15 gm a day as indicated by the urinary losses which tend to reflect the minimal sodium intake. In Japan, in studies done between 1954 and 1958, the average sodium intake was 14 gm a day with a range between 4 gm and 29 gm a day, and the incidence of hypertensive disease is also considerably higher. This, again, lends support to the sodium theory of arterial hypertension. In the primitive tribes, as mentioned earlier, in which there is a very low level of hypertension, the intake of sodium is between 1 gm to 2 gm a day, which is extremely low. Another very interesting population study is recorded in the *New England Journal of Medicine,* September 5, 1968.[6] The populations were of the same broad ethnic origin. One was the population of Pukapuka in northern Cooke Island. These people live in a below-subsistence-level economy with a diet composed chiefly of coconut and fish. The other group was a sample of adults who lived in the town of Abarua in southern Cooke Island for at least ten years. These people had a more advanced economy and had ready access to a varied diet including some canned goods. The conclusions of these studies suggest considerable differences between the two populations in blood pressures, which seems to confirm the work of other investigators. The differences were not attributable merely to the relationship of blood pressure to the body weight, height, and other factors, as these were allowed for. There was no question that there was an habitual salt intake that was much higher in Abarua than in Pukapuka. The surveys showed that the salt intake in Pukapuka was 50 to 70 milli equivalents a day and 120 to 140 in Abarua. Similarly, they found a positive correlation, that was statistically significant, between the blood pressures in the high sodium and the low sodium groups.

Rehabilitation Needs of Patients with Spinal Cord Injuries

In a report [1] several years ago on spinal cord injuries, I made a plea that a center for paraplegics be established in Maryland. At that time, I had in mind as a model the National Paraplegic Center at Stoke-Mandeville in England where nearly all spinal cord injuries in Great Britain are treated. Such a center in Maryland would accept all acute spinal cord injuries at the earliest possible moment from all over the state for emergency and early care. This is a major problem at the present time because no one hospital accumulates enough experience or has enough trained personnel to care for this very specialized problem. The centralization of such trained personnel in a single hospital should greatly improve the early care.

The early care would be defined as six months to a year following injury. Recent advances in stabilization of the neck ("Halo" neck apparatus), use of ilio-conduit bladders, and Stryker pads could all be evaluated and put to optimal use in a center where experienced people were working. A major effort at emotional and motivational aspects would be required both early and late in the course of treatment.

A second stage would be beginning both physical and vocational reeducation. Increasing the educational level of patients with spinal cord injuries is most important for the majority of patients. In addition, there might be vocational shop training, a sheltered workshop, or other demonstration to the patient that he can be at least partially financially self-supporting.

The third stage would be placement of the patient. Some would become vocationally independent. Others would be placed in a nursing home, hopefully a special nursing home for young people, with activities and continuing educational efforts. Some would return to their homes. All patients would need to be followed permanently from the medical point of view, probably at the central hospital, for bladder care, treatment of ulcers, and the intermittent hospitalization so characteristic of patients with spinal cord injuries.

When this plan was suggested, there were no funds available for such a project. With the development of Regional Medical Care (stroke, heart disease, cancer program) it may be possible to establish such a unit to meet this very difficult problem, such as the Southwest Regional System for Treatment of Spinal Injury in Arizona.

A first step in such an undertaking is a definition of the problem: How many patients might benefit from such a program? What benefits not now available might be expected? What would it cost? Two recent articles, one from a rehabilitation center and the other from the National Paraplegic Foundation, present information on the problems and results of caring for patients with spinal cord injuries.

* * * * *

Siegel [2] reports on 143 quadraplegics discharged from the Institute of Rehabilitation Medicine, New York University, between 1962 and 1967. One hundred and thirty-two patients were quadraplegic as the result of trauma, and 11 as a result of poliomyelitis. Of the 131 patients from whom data were obtained, 34% were in competitive employment,

47% were in school, 2% were homemakers, and 17% were unemployed. Thus, of the total group, 81% (including those actually employed and those in school) were potentially self-supporting.

* * * * *

The National Paraplegic Foundation has published an excellent study [3] of the rehabilitation needs of the spinal cord injured and disabled. The ultimate aim of the project was to demonstrate methods of coordination and organization to improve the availability of services to paraplegics. Such a study is long overdue. Although veterans with paraplegia have been given excellent care since World War II, civilians suffering similar accidents have not.

This study attempted to find all paraplegics in Arkansas, Indiana, and New Jersey, to identify their needs, to evaluate the services and facilities available to them, and to formulate plans through which the local community and rehabilitation agencies might improve treatment.

Paraplegia was defined as paralysis of the lower extremities resulting from injury or disease involving the spinal cord; quadriplegia was defined as paralysis of the lower and upper extremities resulting from injury or disease involving the spinal cord at the cervical level. Cases were located through the Veterans Administration, rehabilitation services, hospitals, county health officers, the National Paraplegic Foundation, Public Health Nurses, nursing homes, and other interested people. It is obvious that such a method of obtaining a list of patients is not completely satisfactory. Probably patients with prolonged disability, who were on a number of lists, were selected, rather than the paraplegics of shorter duration, such as those with paraplegia caused by metastases, and infant paraplegics. A total of 1,984 questionnaires were sent to patients in the three states. Six hundred and thirty (32%) returned the questionnaire. Incomplete or unreadable questionnaires were eliminated. In all, 566 questionnaires were analyzed.

Incidence

The information from Arkansas was most complete, because all rehabilitation services are coordinated by the State Department of Education. A census of these disabilities, taken in Arkansas in 1958, showed approximately five spinal cord injured and disabled persons per 10,000 population. Using the same proportion to the total population of the United States (190,000,000) would give a national estimate of about 95,000 paraplegics and quadriplegics. If Maryland had 2% of the total population in the United States, there should be about 2,000 paraplegics and quadriplegics.

Fifty-seven percent of those answering the questionnaires were paraplegics; approximately three quarters of all patients were men. Forty-two percent of the study group were veterans, and only 35 (11% of the veterans) were disabled from combat injuries. The educational level of the cord injury group averaged about a year greater than the general population in each of the three states. Approximately half of those with spinal cord injuries had been married; 73.8% of the paraplegics, and 70.1% of the quadriplegics had one child or more. Divorces were relatively uncommon among both groups.

Automobile accidents accounted for 25% of the cases, poliomyelitis 16%, disseminated sclerosis 7%, falls 7%, combat injuries 6%, sports 6%, gunshot (not service-connected) 5%, and industrial accidents 4%. This accounts for only 76% of the total cases. Relatively few patients with congenital abnormalities of the cord were located.

Hospitalization and Rehabilitation

The average initial hospital admission was seven months for both paraplegics and quadriplegics. The average length of disability of the entire sample was 11.25 years. Only 29% indicated a current need for hospital aid. This was probably related to the length of disability. Most of the patients who reported a need for services desired more physical therapy.

The patients believed that an adequately trained staff was the most important need in hospitals. Psychological and vocational counseling and physical therapy were specialties most frequently believed inadequate. Only 27% had attended a rehabilitation center for treatment. Fifty-six percent of the patients who attended rehabilitation centers accomplished goals which they had set for themselves. This is a surprisingly high figure. There is no estimate from those who did not attend rehabilitation centers.

Paraplegics expressed interest in obtaining more vocational counseling and training. Quadriplegics expressed a need for further physical therapy. A study was made of ten paraplegics and eight quadriplegics from Arkansas who reported a need for rehabilitation center services. Eight of these had received previous services and it was felt that five of them could not profit from additional services because of motivation problems. Four of these people were paraplegics and, in all instances except one, the rehabilitation counselor felt that the receipt of monetary compensation (social security disability benefits) negatively influenced the desire for further service. Discontinuity of services in transfer from hospitals slowed physical progress and extinguished motivation for social-vocational rehabilita-

tion. Civilian hospitals have failed to recognize the value of continuous integrated delivery of services.

Employment Status

Excluding patients currently hospitalized and students and housewives, 41% of the total group of civilians were employed—47% of the paraplegics and 33% of the quadriplegics. Most of these were self-employed in businesses they had started themselves. Only 12% had been placed by rehabilitation counselors. Those employed averaged over two years more education than those unemployed. Of those who had attended or graduated from college, 76% were employed, in contrast to 36% who had attended or graduated from elementary school only. These figures suggest that unemployment is uncommon for the disabled who possess a college education.

There was a prolonged period before the patient could face the requirements of normal living again. Very few civilians who had been disabled in the last five years were employed. Only 39% of paraplegics and 44% of quadriplegics who had attended rehabilitation centers were employed. Individual drive and motivation are major factors in returning to employment.

Three fifths of those not working stated that their physical condition prohibited employment. Persistent pain, urinary tract infections, and recurrent muscle spasms were among the major symptoms restricting employment. Financial compensation from employment was generally not sufficient to motivate them to compete with able-bodied people for work.

In summary, a number of important factors will influence whether the patient with a spinal cord injury becomes employed. First, the extent of the paralysis is of great but not absolute importance. The speed of recovery will depend on the patient's prior psychological makeup, his previous work level, and his educational background. His success with rehabilitation, in his own eyes, is of importance. The job opportunities in the community and the attitude of employers are of great importance as is the financial return from the work.

It seems clear, however, that educational level and individual motivation are the major factors in making a successful adjustment to spinal cord injury. Assuming adequate basic medical care, the major task of the rehabilitation team is to find ways to educate and motivate patients.

Final Conclusions and Recommendations

There is an increasing number of traumatic spinal cord injuries. The rehabilitation services available are very narrow. The number of people trained to care for these people in medical, nursing, and paramedical specialties is far too small. Coordination of local facilities is a major need and would result in improved treatment.

The report recommends that state divisions of vocational rehabilitation assist in the establishment of rehabilitation councils whose purpose would be to explore the present patterns of service offered spinal cord injuries, determine what their future needs might be, suggest methods for improving and coordinating service programs, and attempt to facilitate communications among various agencies so that they might better understand their roles and responsibilities.

* * * * *

This report suffers from two major deficiencies. First, only 32% of the questionnaires were returned. Some of these had to be eliminated so that the sample was very small. There is every reason to believe that the patients who returned questionnaires were significantly different from those who did not return questionnaires. The exact difference, of course, cannot be pinpointed, but it might be expected that those who were illiterate or very poorly educated were not represented. The design of the search for patients would tend to eliminate those who had paraplegia as a result of neoplasms or congenital defects, since they are unlikely to live long enough to be recorded in such a survey. These patients constitute an important group suffering spinal cord disabilities, and much can be done to help them.

A second major problem with this study is that the patients themselves judged whether or not their rehabilitation needs had been met. This method of evaluation may be more a measure of the patient's frustration than of the quality of rehabilitation facilities.

Nevertheless, this is the best, if not the only, study of the socioeconomic results of treatment of patients with spinal cord diseases and injuries. It is sufficiently large to identify the major needs which are not being met.

* * * * *

Recommendations for Improvement of Care of the Spinal Cord Injured in Maryland

1. It is clear that a survey of the situation of the spinal cord injured should be made in Maryland. Data on the number of cases, their present location, the available facilities, their employment status, unmet needs, and costs should be collected.

2. This study should be performed by a permanent official committee representing all those interested in the problem. In Arkansas, the State Department of Education has responsibility for such information and planning. The National Paraplegic Foundation has taken initiative in the report summarized above. The Regional Medical Program is another possible organization which might undertake such a study.
   Studies by individuals and hospitals have little impact because the problem extends beyond any single hospital and requires support of educational, rehabilitation, long-term care facilities, and vocational resources. Interhospital responsibilities and the private practice of medicine are involved in the problem.
3. The increasing number of patients with severe head injuries and brain damage secondary to anoxia should be investigated as a possible related problem to spinal cord injuries.
4. A spinal cord injury registry should be started in Maryland.

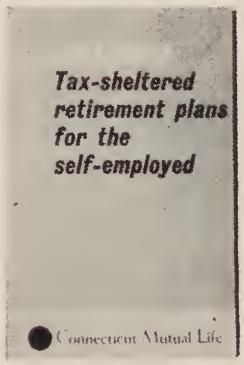
Should You Incorporate?

Maybe Yes.

The present I.R.S. position boils lown to this: When you become an em-)loyee of your own professional corpo-ation or association, a lot of good things :an happen. For one thing, you may cut 'our income tax. For another, you can beef up your retirement investments with more tax-sheltered dollars.



After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the natter further with your attorney or tax ccountant.

Maybe No.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions. And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet, "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

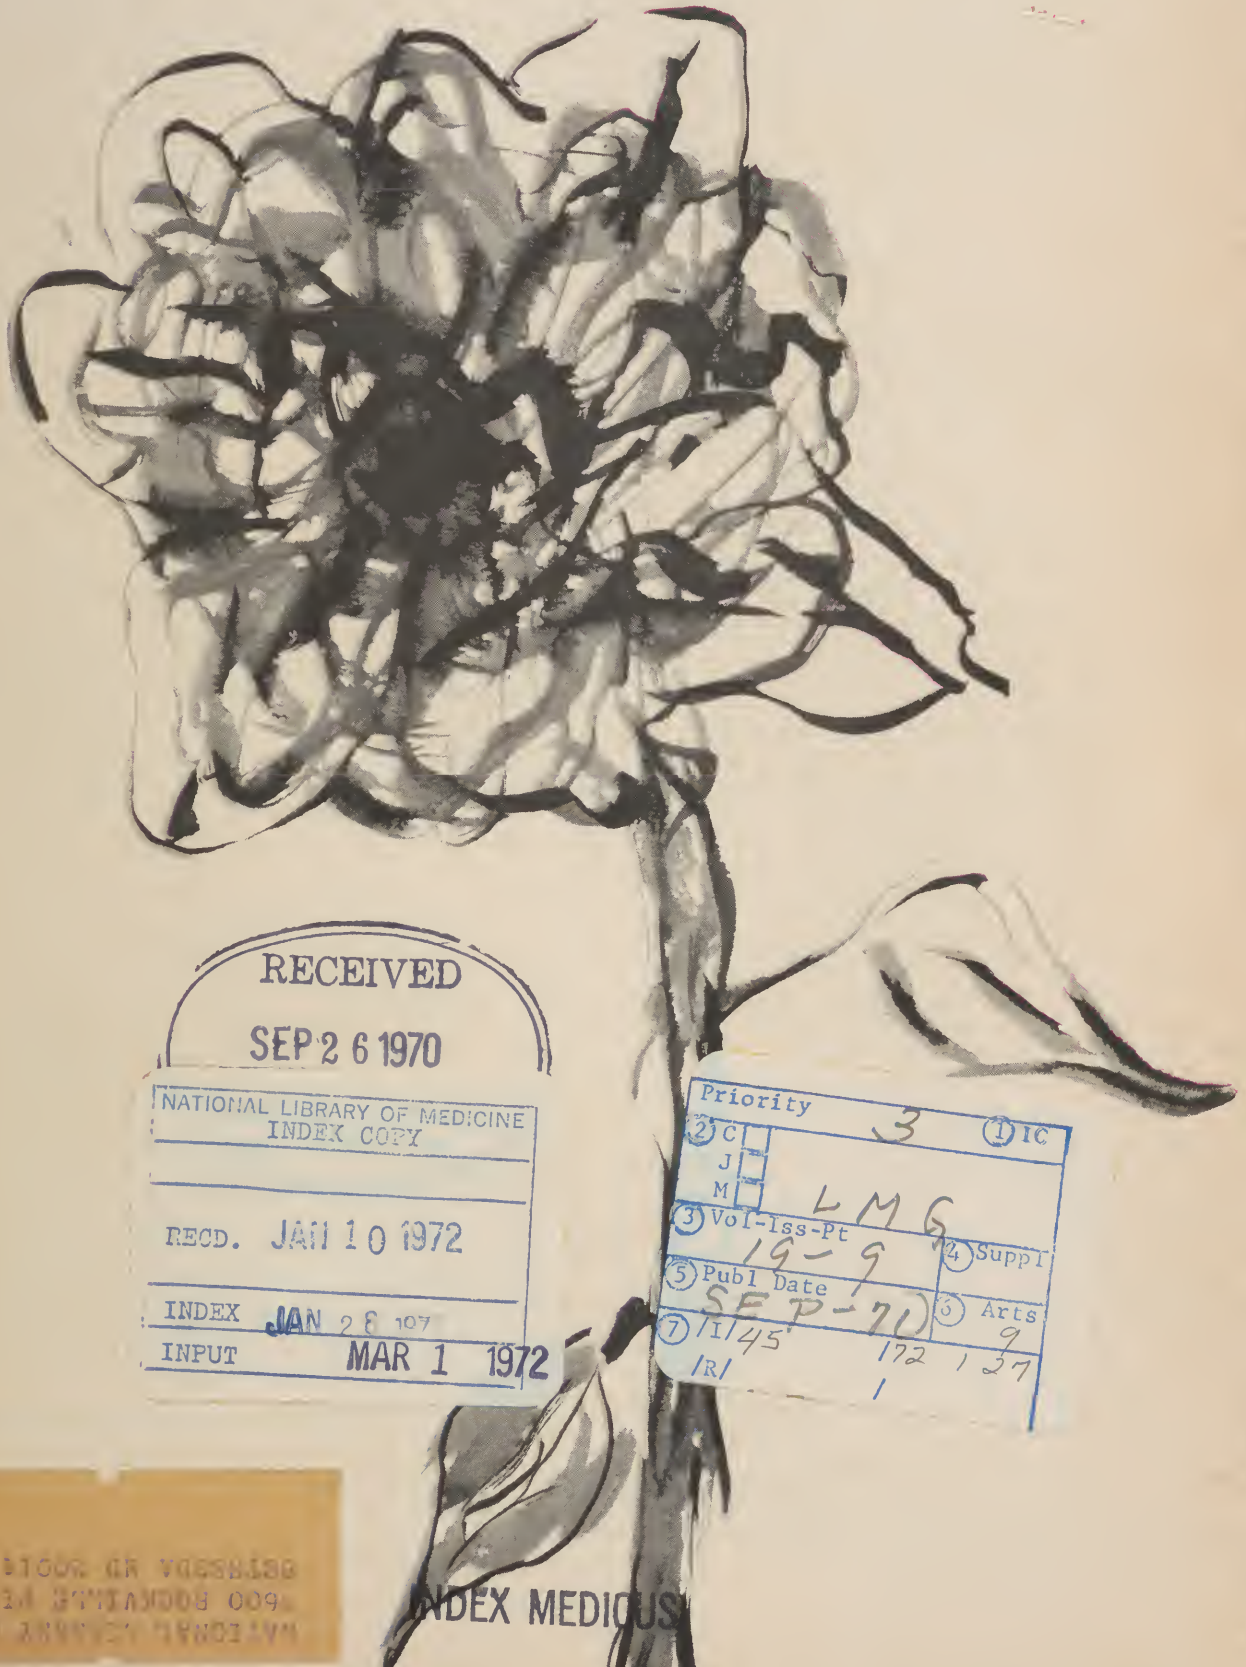
Before prescribing, please consult complete produet information, a summary of whieh follows:

Indieations: Tension and anxiety states; somatie eomplaints which are coneomitants of emotional factors; psyehoneurotie states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; aeute agitation, tremor, delirium tremens and hallucinosis due to acute aleohol withdrawal; adjunetively in skeletal musele spasm due to reflex spasm to loeal pathology, spastieity eaused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindieated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaueoma.

Warnings: Not of value in psyehotie patients. Caution against hazardous oeeupations requiring eomplete mental alertness. When used adjunetively in eonvulsive disorders, possibility of ineraese in frequeney and/or severity of grand mal seizures may require inereased dosage of standard antieonvulsant medieation; abrupt withdrawal may be assoeiated with temporary ineraese in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillanee beeause of their predisposition to habituation and dependence. In pregnancy, lactation or women of ehildbearing age, weigh potential benefit against possible hazard.

Preeautions: If eombined with other psyehotropics or antieonvulsants, eonsider earefully pharmaeology of agents employed. Usual preeautions indieated in patients severely depressed, or with latent depression, or with suieidal tendencies. Observe usual preeautions in impaired renal or hepatie funetion. Limit dosage to smallest effeetive amount in elderly and debilitated to preelude ataxia or oversedation.



Side Effects: Drowsiness, eonfusion, diplopia, hypotension, ehanges in libido, nausea, fatigue, depression, dysarthria, jaundiee, skin rash, ataxia, eonstipation, headaehe, ineontinenee, ehanges in salivation, slurred speeeh, tremor, vertigo, urinary retention, blurred vision. Paradoxieal reaetions sueh as aeute hyperexcited states, anxiety, hallueinations, increased muscle spastieity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these oecur, diseontinue drug. Isolated reports of neutropenia, jaundiee; periodie blood eounts and liver function tests advisable during long-term therapy.

BSP® DISPOSABLE UNIT

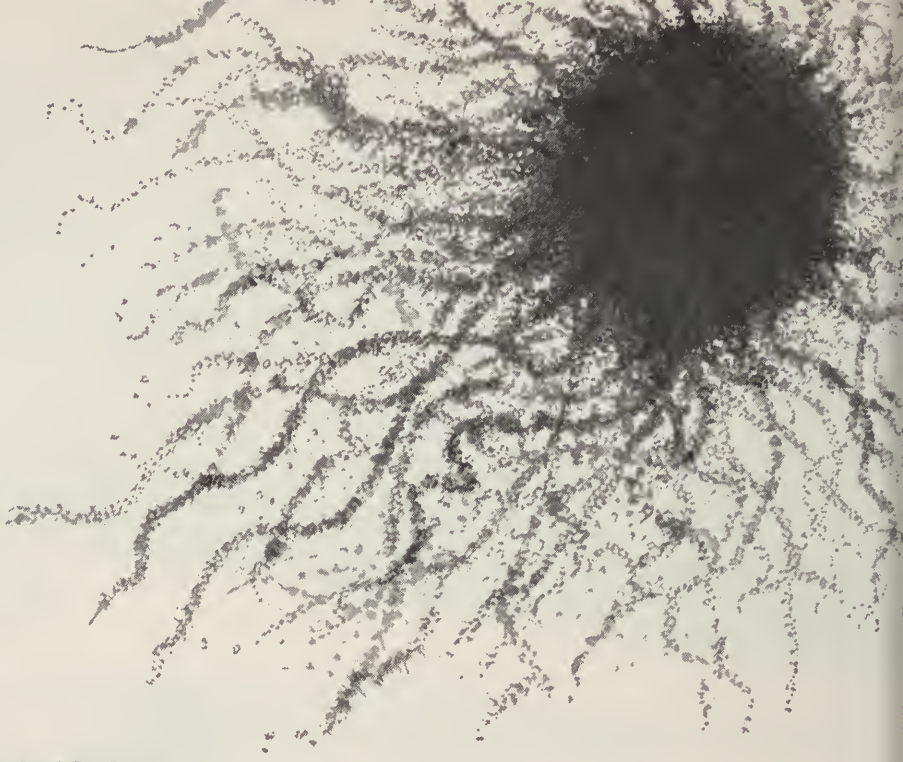
HW&D BRAND OF SODIUM SULFOBROMOPHTHALEIN INJECTION, USP

(50 mg. per ml.)

BROMSULPHALEIN® IN A STERILE, DISPOSABLE, ECONOMICAL UNIT

The Bromsulphalein test is a convenient, sensitive, reliable test of liver function.

The precalibrated syringe contained in the BSP Disposable Unit makes weight calculations unnecessary, providing proper dosage regardless of patient-weight. Each unit contains complete directions for use, precautions and contraindications.



The all-inclusive BSP Disposable Unit provides economic unit dispensing.

Complete literature available on request.

HYNSON, WESTCOTT & DUNNING, INC.

Baltimore, Maryland 21201

(BSP04)

Corticosteroid therapy week after week.

then antibiotic therapy last week.

and monilial overgrowth this week.

For many patients on long-term corticosteroid therapy, the addition of oral antibiotic therapy may trigger monilial overgrowth in the intestine. When you anticipate such a problem, take action with DECLOSTATIN 300. It combines the broad-spectrum potency of demethylchlortetracycline with the antifungal effectiveness of nystatin—it helps avoid monilial take-over. Experience has shown DECLOSTATIN to be highly useful for many women patients; individual culture studies will show exactly where this usefulness may best be applied.

it doesn't let monilia begin where bacteria end.

Declostatin® 300

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units Capsule-Shaped Tablets Lederle

Effectiveness: Because its antibacterial component is DECLOMYCIN® Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose-related. Transient, reversible, nephrogenic diabetes insipidus with excessive thirst and polyuria (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: One tablet b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

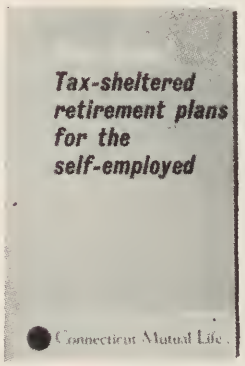
Should You Incorporate?

Maybe Yes.

The present I.R.S. position boils own to this: When you become an employee of your own professional corporation or association, a lot of good things can happen. For one thing, you may cut your income tax. For another, you can beef up your retirement investments with more tax-sheltered dollars.



After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the matter further with your attorney or tax accountant.

Maybe No.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions.

And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet, "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

executive director's newsletter

September, 1970

Members are reminded that the long-standing policy of the AMA permits individual members to express their opinions on matters pending before the AMA House of Delegates. The Reference Committee hearings are open to the public, as well as to interns, residents and medical students.

At the June 1970, Annual Session, a special Reference Committee was established for the purpose of hearing from minority groups, as well as interns, residents and others who wished to speak out with respect to health care matters.

BOARD EXAMINATIONS

In December 1970, the Board of Medical Examiners will initiate the FLEX examination. This is a uniform, nationwide examination for medical licensure that is machine graded and provides various options for answers.

The FLEX examination will be given as a unit, except for re-examination purposes. The basic Science portion of the examination and the Clinical Science portions will not be separated as they have been previously.

Opportunities for re-examination in certain subjects will be provided to those who have previously failed. Re-exams will be given in December 1970 and again in June 1971. The format will remain the same.

After June 1971, any unsuccessful candidate will be required to take the FLEX examination for licensure and, in addition, must make proper re-application for same.

REGULATIONS ON ADVERTISING

The Board of Medical Examiners has adopted new regulations regarding advertising, as stipulated by the revised Medical Practice Act.

An opportunity to examine these regulations, and to make comment on them is available to all interested parties for a 30-day period. Following this period, such regulations will go into effect and have the force of law.

TRIENNIAL REGISTRATION

The Board of Medical Examiners has made arrangements to see that all physicians retain the same registration number each time they are required to

TRIENNIAL REGISTRATION (cont'd)

register with the Board. This will simplify reregistration procedures and enable physicians to utilize this number in any correspondence dealing with their Maryland licensure.

1971 ANNUAL MEETING

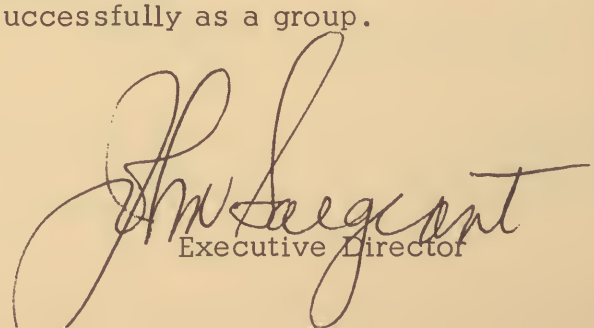
The 173rd Annual Meeting of the Faculty will be held at the Civic Center in Baltimore, May 12, 13, 14. More space will be available for SCIENTIFIC EXHIBITS -- see page 17 of this Journal for application form or contact the Faculty office.

1971 SEMIANNUAL MEETING

The El Conquistador Hotel and Club in Las Croabas, Puerto Rico, will be the site of the 1971 Semiannual Meeting from September 15 to 19. Contact the Faculty office now for your reservations. Business sessions will be in Maryland.

MEDICAL ASSISTANTS' SEMINAR

The annual Seminar for Medical Assistants will be held on



Wednesday, September 23, 1970
and
Thursday, September 24, 1970

in the Charles Room of the Belvedere Hotel, Baltimore.

Further details and preregistration form will be in the mail shortly. Watch for it!

PROFESSIONAL INCORPORATION

Professional Management Consultant Howard Baker, Waterloo, Ia., recommends 4 tests for MDs considering incorporating: (1) Group should have minimum of 2 MDs, 3 is preferable, (2) Group should have average profit per MD of at least $35,000, with no one in group lower than $30,000, (3) MDs should collectively be willing and able to contribute at least 10% of their earnings to profit-sharing plan. If all MDs cannot agree on this commitment, there is no point in proceeding with corporate plan, and (4) MDs should presently be in partnership practice together, so they know they can practice successfully as a group.

Equipped for the thyroid emergency?

When an ambulance arrives with the unexpected patient presenting the classical picture of myxedema coma, is your hospital suitably equipped? It is if SYNTHROID® (sodium levothyroxine) injectable is at hand. You are also ready to conveniently handle post-operative thyroid medication situations until oral therapy can be reinstated.

In tablet form this single entity synthetic thyroid provides smooth, predictable response for thyroid replacement. An excellent drug for long-term therapy.

But in an emergency, when rapid replacement is needed to sustain life, prompt clinical response is essential. SYNTHROID injection makes this therapy instantly available. Is it available in your hospital?

Levothyroxine has a high binding capacity for serum proteins in contrast to other thyroid medicaments that may contain a thyroactive agent with low binding capacity. *The bound levothyroxine is totally measurable using the serum PBI test. It is not unusual to find PBI levels of 8-10 mcg. per 100 ml. of serum.*

INDICATIONS: SYNTHROID (sodium levothyroxine) INJECTION is specific replacement therapy for diminished or absent thyroid function resulting from primary or secondary atrophy of the gland, congenital defect, surgery, excessive radiation, or antithyroid drugs. It is indicated in myxedematous coma and other thyroid dysfunctions where rapid replacement of the hormone is required. When a patient does not respond to oral therapy, SYNTHROID (sodium levothyroxine) INJECTION may be administered intravenously.

PRECAUTIONS: As with other thyroid preparations, overdose may cause diarrhea or cramps, nervousness, tremors, tachycardia, insomnia and continued weight loss. These effects may become apparent in from 4 days to three weeks. Therefore, patients should be kept under close observation. Medication, in such cases, should be stopped for 2 to 6 days, then resumed at a lower level. In patients with diabetes mellitus, look for possible changes in metabolic activity which may affect insulin or other antidiabetic drug dosage requirements.

CONTRAINDICATIONS: Thyrotoxicosis, acute myocardial infarction.

SIDE EFFECTS: Side effects are secondary to increased rates of body metabolism: sweating, heart palpitations with or without pain, leg cramps, weight loss, diarrhea, vomiting and nervousness. Myxedematous patients with heart disease have died from abrupt increases in dosage of thyroid drugs. In most cases, a reduction in dosage followed by a more gradual adjustment upward will indicate the patient's dosage requirements without the appearance of side effects.

DOSAGE AND ADMINISTRATION: In myxedematous stupor or coma, with no evidence of severe heart disease, 200 to 400 mcg. of SYNTHROID (sodium levothyroxine) INJECTION may be administered intravenously utilizing a solution containing 100 mcg. per ml. Detectable effects are usually observed by the sixth hour after injection and are fully appreciated during the following day. A repeat injection of 100 to 200 mcg. may be given on the second day if significant improvement has not occurred. The intravenous use of sodium levothyroxine in myxedematous coma is advantageous because it produces a predictable increase in the concentration of protein-bound iodine, eliminates the need for multiple doses until oral therapy is reinstated, circumvents the uncertainty of oral absorption, and avoids the risk of pulmonary aspiration.

SUPPLIED: SYNTHROID (sodium levothyroxine) INJECTION is supplied in 10 ml. vials containing 500 mcg. of lyophilized active ingredient and 10 mg. of Mannitol, N.F.; a 5 ml. vial containing Sodium Chloride Injection, U.S.P. is provided as diluent.

Also supplied as SYNTHROID (sodium levothyroxine) TABLET in color coded compressed tablets, and in seven strengths: 0.025 mg. (orange), 0.05 mg. (white), 0.1 mg. (yellow), 0.15 mg. (violet), 0.2 mg. (pink), 0.3 mg. (green), and 0.5 mg. (blue). Each strength is supplied in bottles of 100 and 500 tablets.

One tablet q.i.d.

Indications: When used as adjunctive therapy for the rapid resolution of inflammation and edema, good results have been obtained in:
☐ Accidental Trauma ☐ Postoperative Tissue Reactions.
Other conventional measures of treatment should be used as indicated. In infection, appropriate anti-infective therapy should be given.
Contraindications: ORENZYME BITABS should not be given to patients with a known sensitivity to trypsin or chymotrypsin.
Precautions: It should be used with caution in patients with abnormality of the blood clotting mechanism such as hemophilia, or with severe hepatic or renal disease. Safe use in pregnancy has not been established.
Adverse Reactions: Adverse reactions with ORENZYME have been reported infrequently. Reports include allergic manifestations (rash, urticaria, itching), gastrointestinal upset and increased speed of dissolution of animal-origin surgical sutures. There have been isolated reports of anaphylactic shock, albuminuria and hematuria. Increased tendency to bleed has also been reported but, in controlled studies, it has been seen with equal incidence in placebo-treated groups. (See Precautions.) It is recommended that if side effects occur medication be discontinued.
Dosage: One tablet q.i.d.

A GIANT STEP FORWARD FOR THE

173rd ANNUAL MEETING

of the

MEDICAL AND CHIRURGICAL FACULTY

to be held at the

BALTIMORE CIVIC CENTER

There will be more space for SCIENTIFIC AND TECHNICAL EXHIBITS, better general facilities, ample convenient parking, and many other advantages.

A most informative educational scientific program is being planned, including a session on continuing medical education, a pediatric day, and other lectures, all of which will be of interest to physicians in general practice and the various specialties.

The annual Round Table Luncheon will be held at the Civic Center, and the Presidential Reception and Banquet will again be at the Blue Crest North. Members of the Faculty will again provide the Health Evaluation Tests for their fellow physicians. Many other interesting events are being scheduled.

Fast...long-lasting relief of aches and pains of colds and flu

with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 6,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

Available: Bottles of 12, 36 and 60 tablets.

MRS. ROBERT W. GARIS, EDITOR

Annual Convention News

Mrs. DeWitt E. DeLawter
First Vice-President

Mrs. H. Leonard Warres
Representative

Mrs. Albert F. Cooper
Member-at-large

The 47th annual convention of the Woman's Auxiliary to the American Medical Association was held June 21-25, 1970 at the Drake Hotel, Chicago.

Mrs. R. C. L. Robertson was elected president of the AMA auxiliary and implemented the phrase, "Service in the 70's" as the theme of her inaugural address. Mrs. Robertson said that we should investigate and become involved. "Each of us can do something worthwhile if we but will it."

The director of the women's activities for the National Association of Manufacturers, Mrs. Louise Bushnell, was the keynote speaker at the opening session. She currently serves as liaison officer between the NAM and volunteer groups.

Mrs. Bushnell challenged the members to find the answers to the world's greatest problems by "cleaning out the cerebral cobwebs, first from ourselves and then from others." In explaining, she commented that any well-trained person with experience and ability should be hired to work in any hospital, school or business. "Snob appeal is a cobweb," she said. "We should not show prejudice of any kind. Instead, we should strive to make freedom work."

Mrs. John Chenault, outgoing president of the AMA auxiliary, reported that the work of all national committees has been increased. Many states have used the package programs. These have been updated and one on smoking has been added. According to Mrs. Chenault, the American Medical Association's Emergency Relief Fund has received over $4,000,000 since the woman's auxiliary took over the project in 1951. She also noted that a record breaking $498,950.69 was given to AMAERF this past year. This is a $70,000 increase over the preceding year.

Awards were presented to the states for their contributions. Maryland received four awards. The state auxiliary received one for being the state with the highest percent of increase over the past year. Baltimore County's auxiliary received another for donating the largest per capita contribution. Both Montgomery County's and Baltimore city's auxiliaries received awards for netting the largest contributions in their respective membership categories. The top contributor award went to California for its gift of $72,514.

A resolution was passed on health care of the poor. This resolution supports the one passed by the AMA House of Delegates at the 1969 convention. It recognizes the basic right of every citizen to have available to him adequate health care and recommends that the Program Development Committee implement this program to include care for the Indian, the migrant, and the ghetto resident.

A fashion show depicting the role of "Woman thru the Ages" was sponsored by the Community Homemakers Health Aid Service Inc., Kenosha, Wisconsin. The 32 models, who supplied and paid for the costumes which they wore, were the wives of physicians, dentists, pharmacists, and lawyers is Kenosha.

Mrs. H. Leonard Warres was named Eastern Regional Chairman of International Health.

An idea-exchange session was also conducted during the convention. Members from the various states reported what their respective states had done in order to raise money for worthwhile projects.

Arizona netted $2,200 from a "Silent Auction" for AMAERF. It also sponsored a short internship in anesthesia for a Bolivian nurse through its International Health Committee.

Hawaii collected $3,000 for AMAERF by conducting a dinner-auction.

Virginia collected new and used shoes and distributed them to needy children.

Oregon reported visits by the chairman of International Health and her husband to remote Mexican clinics, and the distribution there of some of their collected drugs.

Washington State collected 14½ tons of supplies valued at $222,825 for International Health.

New Jersey raised $1,200 for the drug abuse program from a golf tournament.

AMAERF Student Loan Guarantee Program

This year the STUDENT LOAN GUARANTEE PROGRAM has been reactivated to encourage career decisions and to help ease the financial difficulties of medical students, residents, and interns.

Each dollar contributed to this fund puts another $12.50 to work in loans made by a commercial bank. As the Loan Guarantee Fund increases from contributions and appreciation, more money becomes available for guaranteeing future loans. As loans are repaid, money in the fund becomes available once again to guarantee still more loans.

Who Is Eligible?

1. Medical students who have completed their first semester or quarter
2. Interns or residents in good standing who are United States citizens, provided they are enrolled in full-time training at a hospital approved by the Council on Medical Education of the American Medical Association

(A list of approved medical schools appears annually in the Education Number of the *Journal of The American Medical Association*. A list of hospitals with approved Graduate Training Programs is available from the American Medical Association, 535 N. Dearborn, Chicago, Illinois.)

What Are the Mechanics of This Program?

1. The medical student will find application blanks and pertinent details available through the dean's office of the medical school.
2. The resident or intern may obtain application blanks through the office of the hospital administrator.
3. Following completion, the applications are returned to the dean or hospital administrator for certification, and then forwarded to the designated bank.

All applications for Maryland, Virginia, and the District of Columbia are processed by Riggs National Bank in Washington, D.C.

The interest rate applied to student loans in this area is 8%.

When the loan has been granted, a check payable to the applicant is mailed to the official who certified the application.

How Much May the Applicant Borrow?

The student, resident, or intern may borrow a maximum of $1,500 in any 12-month period; $10,000 total in a 7-year period; but may not exceed $15,000 in total accumulated loans. Loan repayment may be spread over a 10-year period.

Should the individual enter the armed forces and lose his life, or should he die from other causes, the loan is automatically cancelled. Neither his family nor his heirs are held liable for repayment.

Mrs. Raymond Yow, president of the Woman's Auxiliary to the Medical and Chirurgical Faculty, displays one of three AMAERF picture awards presented to her during the national auxiliary's recent annual convention. The state auxiliary received recognition for having the largest percent of increase over the past year. The Baltimore County auxiliary donated the largest per capita contribution, and the Baltimore city and Montgomery County auxiliaries received awards for the largest per capita contributions in their respective membership categories.

MEDIC

1970-1971 SCHEDULE OF POSTGRADUATE PROGRAMS
presented through
Medical Education's Dedicated Instructional Channel

APPROPRIATE CREDIT WILL BE GIVEN BY THE AMERICAN ACADEMY OF GENERAL PRACTICE FOR ATTENDANCE

WEDNESDAY EVENING SERIES — 8:00 PM

The management of a variety of medical problems will be discussed by faculty members from The Johns Hopkins University School of Medicine. This series will be presented each month from the Greater Baltimore Medical Center on Wednesday evenings and then replayed as part of the Friday lecture series.

September 30, 1970

PRO'S AND CON'S OF PROPHYLACTIC ANTIBIOTICS

Jack M. Zimmerman, MD
Associate Professor of Surgery
Johns Hopkins School of Medicine

Charles O'Donovan, III, MD
Instructor in Medicine
Johns Hopkins School of Medicine

November 4, 1970

COMPLICATIONS OF RHEUMATOID DISEASE

Lawrence E. Shulman, MD
Associate Professor of Medicine
Johns Hopkins School of Medicine

Lee H. Riley, Jr., MD
Associate Professor of Orthopedic Surgery
Johns Hopkins School of Medicine

December 2, 1971

MANAGEMENT OF ULCERS

David B. Skinner, MD
Assistant Professor of Surgery
Johns Hopkins School of Medicine

Thomas R. Hendrix, MD
Professor of Medicine
Johns Hopkins School of Medicine

February 3, 1971

MANAGEMENT OF U.T.I.

Patricia Charache, MD
Assistant Professor of Medicine
Johns Hopkins School of Medicine

March 3, 1971

ILEOSTOMY AND COLOSTOMY MANAGEMENT

Marvin M. Schuster, MD
Assistant Professor of Medicine
Johns Hopkins School of Medicine

March 31, 1971

F.U.O. — MEDICAL OR SURGICAL?

Philip A. Tumulty, MD
Professor of Medicine
Johns Hopkins School of Medicine

May 5, 1971

REPARATIVE CARDIAC SURGERY

Vincent L. Gott, MD
Professor of Surgery
Johns Hopkins School of Medicine

J. O'Neal Humphries, MD
Associate Professor of Medicine
Johns Hopkins School of Medicine

SPONSORS:

Medical and Chirurgical Faculty of the State of Maryland

State Department of Health Hospital Council of Maryland

- **FIRST FRIDAY** — The management of a variety of medical problems will be discussed by faculty members from The Johns Hopkins University School of Medicine. This series will be presented live from the Greater Baltimore Medical Center on Wednesday evenings and then replayed as part of the Friday lecture series.

- **SECOND FRIDAY** — In conjunction with the Department of Family Medicine at the University of Maryland School of Medicine, a series of topics have been scheduled for presentation from St. Agnes Hospital. The faculty will be composed of members from the University of Maryland School of Medicine.

September 25, 1970
MANAGEMENT OF CONVULSIONS
Guy Mead McKhann, MD
Director, Department of Neurology
Johns Hopkins School of Medicine

Take a relaxing break for Coca-Cola. Couple of times a day. Because Coke has the taste you never get tired of. It's always refreshing.

What is worth doing..

In 1936 A. E. Smith, professional at Woolcombe, England, recorded the low golf score for an 18 hole course. He sh 55 and was 15 under par. The course at Woolcombe, which measured 4,248 yar was covered in 4, 2, 3, 4, 2, 4, 3, 4, 3 o and 2, 3, 3, 3, 3, 2, 5, 4, 1 in.

s worth doing well.

Take ACHROMYCIN V, for example. Lederle routinely runs over 1,000 quality control checks on every batch produced. Many, many more than officially required. This extra attention means your patients get what the doctor ordered when you prescribe ACHROMYCIN V: uniform *in vitro* dissolution rate, predictable *in vivo* serum and urinary levels. In short, known biologic availability of tetracycline. And every step in the production of ACHROMYCIN V is in-house controlled right in Pearl River.

ACHROMYCIN®-V
Tetracycline HCl

Performance proved in practice

fectiveness: ACHROMYCIN tracycline is a crystalline broad-ectrum antibiotic which provides fective therapeutic activity against sceptible microorganisms.
ntraindication: History of persensitivity to tetracycline.
arning: In renal impairment, usual ses may lead to excessive cumulation and liver toxicity. Under ch conditions, lower than usual doses e indicated and, if therapy is olonged, serum level determinations ay be advisable. Some patients may velop a photodynamic reaction to tural or artificial sunlight. Those with a story of photosensitivity reactions ould avoid direct exposure to sunlight ile under treatment. Discontinue drug first evidence of skin discomfort.
cautions: Use may result in ergrowth of nonsusceptible organisms. Constant observation is essential. If new infections appear, take appropriate measures. Use of tetracycline during teeth development may cause discoloration of teeth.
Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes (a case of exfoliative dermatitis has been reported); photosensitivity reaction, onycholysis and discoloration of nails (rare). Kidney—rise in BUN, apparently dose-related. Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. In young infants, bulging fontanels have been reported following full therapeutic dosage. This symptom has disappeared rapidly when drug is discontinued. Teeth—dental staining (yellow-brown) in children of mothers given tetracycline during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. Blood—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. Liver—cholestasis (rare), usually at high dosage. Tetracycline may form a stable calcium complex in bone-forming tissue. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.
Average Adult Daily Dosage: One Gm. per day, in 4 divided doses of 250 mg. each. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

Lederle LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York 10965

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

May 12, 13, 14, 1971
Civic Center, Baltimore

More space is available than in former years. However, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

_____

5. Has exhibit been shown at other medical meetings? _____

_____

6. Name and title of exhibitor: _____

_____

7. Name of institution cooperating in the exhibit: _____

_____

8. Address of exhibitor: _____

_____

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

alcoholism section

The Early Alcoholic: Kindness vs. Confrontation

WILLARD O. FOSTER, JR.
Industrial Program Advisor
Division of Alcoholism Control
Maryland Department of Health and Mental Hygiene

To survive on any job, an employee with alcoholism must keep his illness and its effects a deep, dark secret. He may be unaware that he is suffering from a treatable condition, but he is still aware that his drinking habits make him vulnerable to discipline or discharge, and they must be concealed at all costs. When, especially in the later stages of his disease, his behavior unwittingly reveals the extent of his drinking, he is driven to even greater lengths, either to conceal this behavior, or to offer alibis for it.

During the early stages of alcoholism, the business of remaining invisible is not too difficult for the average employed drinker. He generally has a ready and apt alibi for the relapses that do occur. He covers his initial high rate of absenteeism with sick leave certificates obtained for a variety of obscure ailments from an equal variety of unsuspecting or well-meaning physicians. His initial hangover difficulties at work he comfortably and convincingly ascribes to off-the-job problems, which include everything from his mother-in-law to an ailing rosebush in the front yard. The result is that he is seldom directly confronted with the possibility that he may be in trouble with alcohol.

As his disease progresses, his behavior becomes more difficult to conceal and, of necessity, his alibis become more grotesque. By now he has become highly skilled in arousing and depending upon a sympathetic attitude on the part of his fellow employees to protect him from the more serious consequences of his actions.

Here indeed we have an unhappy situation. As with any other illness, alcoholism is most amenable to treatment in its early stages. And like many other illnesses, alcoholism becomes more resistant to treatment as time goes by. Thus, after a period that may be as long as ten or more years, his disease becomes so firmly entrenched that treatment leading to his sobriety is more difficult and, unfortunately, in too many cases, impossible.

Many of the better-known corporations in the United States have adopted firm and expressed policies with respect to the employee with alcoholism. These policies have come about through the realization that rehabilitation of the alcoholic employee, especially in the earlier stages of his illness, is far less costly and more humane than ignoring him and allowing the inevitable consequences of his actions to result in his eventual death.

In some companies, however, the publication of such a policy, even when accompanied by detailed procedures as to the means by which the policy will be carried out, has not always demonstrated the degree of success that experience in other companies might indicate.

Dr. Harrison M. Trice of the New York School of Industry and Labor Relations at Cornell University defines this problem as a "policy-practice gap" and has given it research attention. Certain findings from his studies create interesting speculation about interpersonal relationships and alcohol abuse. These findings are applicable even outside the work world and serve to explain, at least in part, the ambivalence toward the sick alcoholic demonstrated by community care-givers and care-giving agencies.

Initially, it must be recognized that, common to

our cultural and community attitudes toward drinking and intoxication, there is a measure of tolerance as long as drinking behavior does not become too socially objectionable. Similarly, this same feeling is expressed at any given level in a company organization, when work habits first show the effect of alcohol abuse.

Naturally, the alcoholic is aware of and shares in this attitude. Skillfully, he uses it to his advantage in the earlier stages of his illness when his occasional lapses in behavior are noticeable on the job. Thus, his fellow employees, including immediate supervisors, tend to overlook his behavior with a degree of sufferance born of this community point of view. At the supervisory level, this tolerance is even accompanied by overt feelings of protective paternalism. Similar feeling can be demonstrated in authority figures surrounding the alcoholic in the community.

Much of the training of industrial supervisory personnel in the identification of the signs of early alcoholism fails to take these benevolent attitudes into account. Even though the training enables the supervisor to recognize those early signs pointing to drinking problems, he is seldom truly motivated to take the necessary corrective action.

We now have a situation where, not only is the economic and humanitarian value of the company policy negated, but during the very period when most can be done for the alcoholic employee, nothing constructive is done because of misplaced and incorrect attitudes. By the time the behavior of the alcoholic can no longer be condoned, when his alibis become totally unbelievable, and genuine concern is being expressed by his fellow employees and supervisors, the possibility of offering the alcoholic any true help through a company program is doubtful indeed. Again, the same situation applies in the community outside his work world as the alcoholic comes inevitably to the attention of law enforcement, health, and social welfare agencies.

Resolution of the problem for an industrial organization is not always easy. Frequently, we overlook the fact that the alcoholic employee is a true threat to his fellow employees and supervisor, even in the early stages of his disease. The very signs used for early identification of his drinking problem demonstrate this. Regular and unexcused absenteeism, lack of efficiency due to hangovers, a proneness to accidents, together with various unwholesome personality changes, interfere with his own job performance as well as the performance of his fellow employees. He becomes a distinct detriment to the proficiency of the entire working group of which he is a member.

Supervisory personnel can and should be trained to recognize these facts as being threatening to their own job situations and ratings as supervisors. In those industries where the training of supervisors has taken this slant, there has been a marked and rewarding increase in the numbers of employees referred at the early stages of their illness, and a correspondingly higher rate of successful rehabilitation—in some programs as high as 70%.

The parallel in the community should be obvious. To ignore the early signs of alcoholism intentionally as a well-meaning, tolerant gesture is as damaging to the alcoholic as if the same type of response were to be made to the early signs of cancer. Both are terminal illnesses if not arrested by one means or another. To the community, the alcoholic becomes a clear and constant threat as his illness progresses. The valid statistics of traffic fatalities, suicides, homicides, child abuse, divorce, and other community problems stemming from alcohol abuse point this out ever so clearly.

As the supervisor is trained to recognize his employee with alcoholism at the earliest possible time, so must the care-giver be made aware of the threat to the community of his alcoholic patient or client, if his illness is allowed to progress unchecked. Misguided and well-meaning tolerance and ambivalence by care-givers represent a distinct failure in the delivery of their services, and is indefensible morally and legally. As the community care-giver learns and accepts this lesson from industry, the individual and community tragedy that is alcoholism can be significantly relieved.

Book Reviews

DIFFERENTIAL DIAGNOSIS: THE INTERPRETATION OF CLINICAL EVIDENCE, second edition, A. McGehee Harvey, MD, and James Bordley, III, MD; The W. B. Saunders Company, Philadelphia, Pennsylvania, 1970.

The scope of the second edition of this publication has been expanded, and each of the chapters has been largely rewritten. New chapters have been included dealing with hypertension, anemia, diarrhea and malabsorption, and special neurological problems.

Credit is given in the preface to the various people at The Johns Hopkins Medical Institutions for their assistance and permission to use material.

Essentially, this is a case-by-case analysis of patients who have suffered from the various diseases discussed. Its material is taken from CPCs at Johns Hopkins Hospital and other institutions. It summarizes and uses only the essential information from the clinical histories, physical examinations, and progress notes. In so doing, it has made the material somewhat difficult to assimilate. It is, nonetheless, worthwhile reading, especially for its instructional material.

DISABILITY IN ANTIQUITY, Fareed Haj; Philosophical Library, Inc., New York, New York, 1970.

This book studies the major medical and social causes of disability in the Near East during the Middle Ages. While it is primarily of interest to students of ancient and medieval history, those involved in public health will also be interested in this subject.

CANADIAN MEDICAL DIRECTORY, Secombe House, Toronto, Ontario, Canada, 1970.

The 16th edition of this publication is now available which provides a comprehensive listing of all physicians in Canada, as well as other relevant and pertinent medical data not available from any other source.

painless intramuscular therapy for calcium deficiencies:

Calphosan®

calcium glycerophosphate, calcium lactate

To bring effective calcium therapy to the patient, Calphosan may be administered intramuscularly . . . without pain, inflammatory reactions, induration or sloughing. Injections twice weekly for a series of 5 to 10 injections are recommended.

Average dose per injection: One or two 10 ml. injections of Calphosan each week for the first four or five weeks, and on a when-needed basis thereafter.

Calphosan is a specially processed solution of calcium glycerophosphate and calcium lactate, containing 1% of each, in a physiological solution of sodium chloride. Each 10 ml. contains 50 mg. of calcium glycerophosphate, 50 mg. calcium lactate, with 0.25% phenol as preservative. Available in 10 ml. ampules in boxes of 10s and 100s; 60 ml. multiple-dose vials. Also available as Calphosan with B-12. U. S. Patent No. 2657172.

Contraindication: Hypercalcemia; neoplastic diseases; and fully digitalized patients. Do not use intramuscularly in infants and young children. Before starting therapy, consult complete product literature.

Write for free copy of "Calcium: The Ubiquitous and Essential Element" and for samples.

2 ways to give your patients a month's therapeutic supply of Vitamin C:

40 pounds of spinach or 30 Allbee® with C

Although raw spinach is an excellent source of vitamin C, your patient would have to eat 40 pounds a month (about 1⅓ lbs. a day) to get as much ascorbic acid as is contained in just one bottle of 30 Allbee with C capsules (taken one capsule daily). If the spinach is cooked, a person would have to ingest more than twice as much because cooking destroys much of the vitamin C, and still more is lost when the liquid is drained off. Allbee with C also contains therapeutic amounts of B-complex vitamins. This handy bottle of 30 capsules gives your patient a month's supply at a very reasonable cost. Also the economy size of 100. Available at pharmacies on your prescription or recommendation.

A. H. Robins Company, Richmond, Va. 23220

A·H·ROBINS

vacation in a vial: the spasm reactors in your practice deserve

"the Donnatal® Effect"

	each tablet, capsule or 5 cc. of elixir (23% alcohol)	each Donnatal No. 2	each Extentab®

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, MARYLAND STATE MEDICAL JOURNAL, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a maximum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the JOURNAL. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with JOURNAL style.

Statements made or opinions expressed by any contributor in any article or feature published in the JOURNAL are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

Increased interest rates on savings certificates

from Baltimore Federal

Now you can earn increased interest with one of Baltimore Federal's four new savings certificate plans–higher interest that means so much in down-to-earth terms, in the ways you want to enrich life for your family and yourself.

Baltimore Federal now offers 5-1/4% per annum on certificates of $1,000 or more invested for six months... 5-3/4% per annum on one-year certificates of $5,000 and up... a handsome 6% per annum on certificates of $12,000 or more invested for two years ... and an extraordinary 7-1/2% per annum on one-year savings certificates of $100,000 or more. All certificates may be purchased in larger-than-minimum amounts in multiples of $1,000. Interest on all four certificate plans is compounded and credited quarterly, or paid direct to you by check.

Stop in at any convenient Baltimore Federal office and talk over the best savings certificate plan for you. Let Baltimore Federal put a little more of the good life in your life.

MEDICAL NEWS

Edward F. Lewison, MD, Chief of the Breast Cancer Clinic of The Johns Hopkins Hospital, is the only United States participant among ten breast cancer experts at the World Health Organization Committee headquarters in Geneva, Switzerland.

The committee, and the studies it sponsors, is the first WHO program dealing with clinical control of cancer.

Dr. Lewison explained that breast cancer is the most common form of the disease. An estimated 70,000 U.S. women will develop breast cancer during 1970.

* * *

Robert Traub, MD, of the department of microbiology at the University of Maryland School of Medicine, recently attended a Naval Medical Research Unit conference in Cairo, Egypt, where he led a discussion on the ecology of scrub typhus.

* * *

Robert W. Gibson, MD, Medical Director of the Sheppard Pratt Hospital, has received the 1970 Edward A. Strecker, MD, Award as "Young Psychiatrist of the Year".

* * *

Samuel P. Asper, MD, Professor of Medicine, has been appointed Vice-President for Medical Affairs, a newly-created position at The Johns Hopkins Hospital.

Dr. Asper will work with heads of the patient care departments to achieve maximum coordination and effectiveness of patient programs within the hospital.

* * *

Governor Marvin Mandel recently announced the addition of 20,000 needy persons to Maryland's Medicaid roles. This move was made possible through efficiencies implemented under the Governor's executive reorganization program.

* * *

Haig H. Kazazian, Jr., MD, Assistant Professor of Pediatrics at The Johns Hopkins Hospital, was one of eight young American physicians recently awarded traveling fellowships by the Royal Society of Medicine Foundation, Inc. The $2,500 award is for a three-month study in Great Britain.

* * *

Francine Camitta, MD, and **Young E. Chun, MD,** have been appointed associates in medicine at the University of Maryland School of Medicine.

* * *

Chris Papadopoulos, MD, of Baltimore, has been elected president of the Baltimore Metropolitan Division of the Health Association of Maryland. Dr. Papadopoulos is the chief of cardiology and the director of the coronary unit at South Baltimore General Hospital.

* * *

A series of experiments dealing with the **cultivation of the leprosy bacillus** are being conducted by **Claude V. Reich, PhD,** at The Johns Hopkins University.

The project is being financed with a grant from the John A. Hartford Foundation to the Leonard Wood Memorial for the Eradication of Leprosy.

Dr. Reich is the Laboratory Director at the Leonard Wood Memorial in New York.

* * *

John E. Hoopes, MD, has been named Professor and Director of Plastic Surgery, a division of the department of surgery at The Johns Hopkins University School of Medicine.

Besides teaching interns, residents, and medical students at Johns Hopkins, Dr. Hoopes will also teach at Baltimore's City and Children's hospitals.

* * *

Mary P. Sanders Price, Director of The Johns Hopkins Hospital School of Nursing, and the Hospital's Nursing Services, retired recently. She had been director since 1955.

* * *

The Johns Hopkins Hospital Board of Trustees has approved conversion of the hospital's nursing education from a three-year diploma school to a cooperative program with academic institutions.

Under this plan, which was recommended to the trustees by the school of nursing advisory board, the school will accept its last class this fall, and close following the class's graduation in 1973.

* * *

Morris L. Scherr has become the Executive Assistant in the office of the Medical Director at the Sheppard Pratt Hospital. Previously, Mr. Scherr had been the executive director for the Metropolitan Baltimore Mental Health Association.

* * *

David G. Simpson, MD, was recently elected **President of the**

Maryland Thoracic Society, the medical arm of the Maryland Tuberculosis and Respiratory Disease Association.

Allan D. Moodie, MB, DPH, was elected Vice-President and **Mary C. Riley, MD,** was elected Secretary-Treasurer.

* * *

John T. Chissell, MD, of Baltimore, was recently installed as President of the Maryland Academy of General Practice, by Edward J. Kowalski, MD, President of the American Academy of General Practice.

* * *

The Saint Francis Hospital in Beech Grove, Indiana, is attempting to solve the paramedical manpower shortage by a formal training program for obstetrical technicians. The clinical study involves nursing arts, surgery and obstetrics, as well as classes in microbiology, anatomy, physiology, nutrition and interpersonal relations.

Information about this program can be obtained by writing the Staff Education Department, Saint Francis Hospital, 101 North 17th Ave., Beech Grove, Indiana.

* * *

The Department of Specialty Society Services was recently established by the American Medical Association to strengthen services to related medical organizations. Its new director will be Theodore R. Chilcoat, formerly an employee of the Faculty.

* * *

An amendment to Medicare regulations will make it possible for more physical therapists to qualify as practitioners under the Medicare program.

This amendment, according to Robert Ball, Commissioner of Social Security, will specify the alternatives to the present education and experience requirements for physical therapists.

* * *

"With extreme reluctance", Neil Solomon, MD, PhD, Secretary of Health and Mental Hygiene, announced the **retirement of Edward Davens, MD,** Acting Commissioner of the State Department of Health since February 1970.

Dr. Davens, who will now serve as Coordinator of the Regional Medical Program, has been succeeded by **Jean Rose Stiffler, MD.**

* * *

"Automotive Restraint Devices for the Pediatric Patient," an article appearing in a recent issue of *Pediatrics,* the official journal of the American Academy of Pediatrics, has called on physicians to recognize the importance of restraining devices for children.

If more children had been required to use properly designed devices (bassinets, safety harnesses, lap belts, etc.), many of the 5,900 children under 15 years of age who died in motor vehicle accidents in 1969 would have lived, according to the Academy.

* * *

Howard Garber, MD, Chief of the Division of Communicable Diseases, warns Marylanders to guard against dog ticks. Ticks can carry and transmit the organism which causes Rocky Mountain spotted fever.

Last year there were 48 confirmed cases of the disease in Maryland, resulting in three deaths.

* * *

Thomas D. McKewen will head the Directorate for Environmental Health Services, recently created by Neil Solomon, MD, PhD, Secretary of Health and Mental Hygiene. Previously, Mr. McKewen had served as Assistant Commissioner for Environmental Health Services of the State Department of Health.

* * *

Margaret Wiedorn Bridwell, MD, of Washington, D.C., recently became the first gynecologist to serve full-time with the University of Maryland Health Service. Dr. Bridwell, who is also a member of the board of Friendship House in the District of Columbia, is the second woman on the medical staff.

* * *

Gerald R. Clark, MD, has been selected as "Physician of the Year," by the American Medical Association and the President's Committee on the Employment of the Handicapped. Dr. Clark, a psychiatrist, is presently serving as president of Elwyn Institute, Elwyn, Pennsylvania.

Under Dr. Clark's leadership, Elwyn has changed from a custodial institution into one which focuses on education.

* * *

Paul M. Leand, MD, of Baltimore, has left his position as Assistant Professor of Surgery and member of the surgical staff of the Johns Hopkins Hospital to enter the private practice of surgery.

Dr. Leand is board certified in general surgery and thoracic surgery. His office is located at 222 West Cold Spring Lane in Baltimore.

* * *

Metropolitan Baltimore state hospitals graduated the first class of Psychiatric Aides in a jointly sponsored union and state upgrading program. The 64 graduates (57 women and 7 men) are among the first in the country to be graduated from the Hospital Career Development Program, developed by the Ameri-

can Federation of State, County and Municipal Employees (AFSCME) AFL-CIO, under a $1.2 million grant from the U.S. Departments of Labor and Health, Education, and Welfare.

Courses were held at Rosewood, Spring Grove, and Crownsville state hospitals.

* * *

The Department of Health and Mental Hygiene has announced the creation of a new division, a **Vendor Relations Team.** The new unit will be charged with liaison responsibilities between the Department and the providers of services for the Medical Assistants Program.

* * *

Robert M. Ball, Commissioner of Social Security, recently stated that new regulations would be established to make certain that Medicare and Medicaid do not recognize inflated values of profit-making health facilities in paying costs of medical care for the aged.

"This is part of the continuing effort to eliminate all possible fiscal loopholes—potential as well as existing—in the operation of these problems," according to Commissioner Ball.

* * *

Stanley F. Yolles, MD, Director of the National Institute of Mental Health, Health Services and Mental Health Administration, Chevy Chase, announced the creation of a new national training program in suicidology.

Conducted by the training staff of the Institute's National Center for Mental Health Services, Training and Research, in collaboration with the NIMH Center for Studies of Suicide Prevention, the program will take place on the grounds of Saint Elizabeths Hospital in the District of Columbia, and in a variety of local field assignments.

Further information and applications may be obtained by writing to Henry Lederer, MD, 2700 Nichols Avenue, S.E. Washington, D.C. 20032.

* * *

The American Medical Association reports that the war continues between the American Chiropractic Association and members of the scientific community. Recently, the *Senior Citizen's News* published an article entitled "Why Chiropractic Cult Cannot Provide Quality Health Care," and concluded that chiropractic treatment is at best worthless and at worst mortally dangerous.

The AMA states that medicine opposes chiropractic for the same reason it opposes other forms of health quackery and it will try to prohibit poorly trained individuals from performing functions for which they are totally unqualified.

* * *

The Johns Hopkins Medical Institutions and The Good Samaritan Hospital jointly announced that they are beginning a new and cooperative program in rehabilitation medicine.

Arthur K. Siebens, MD, professor and chairman of the department of rehabilitation medicine at the University of Wisconsin Medical Center, will join the institutions to head the program's development.

* * *

The National Association of Residents and Interns, headquartered in New York, released details regarding a new loan program for its members.

A qualifying member, anywhere in the United States, may borrow up to $3,000 on an extended repayment basis—as long as five years. These funds may be used for any purpose the young physician sees fit, and no collateral is required. More information is available through NARI Headquarters, 292 Madison Ave., New York, N.Y. 10017.

* * *

"It's an unpredictable drug, used by unpredictable people, which brings about unpredictable reactions." Neil Solomon, MD, PhD, Secretary of Health and Mental Hygiene, recently issued the above statement to refute the claims of Claude Brown and his brother, Henry, who advocated legalizing all drugs at a meeting sponsored by the Drug Abuse Center of the Henry T. Phipps Psychiatric Clinic of The Johns Hopkins Hospital.

Claude Brown is the author of *Manchild in the Promised Land.*

* * *

Howard B. Silverman has been appointed to the post of Regulations Coordinator of the Maryland State Department of Health and Mental Hygiene. Mr. Silverman served as assistant dean of the graduate school of Morgan State College.

* * *

According to preliminary statistics compiled by the Maryland Department of Health and Mental Hygiene, births to Maryland mothers during 1969 totaled approximately 69,000, some 600 more than those recorded in 1968. While this is the first increase of births in five years, it represents a decrease of 12.7% from the high of 79,003 births recorded in 1964.

* * *

The New York State Action for Clean Air Committee has requested New York State's electric utility companies to reduce or eliminate advertising designed to promote either new uses of electricity or conversion to electricity. Their aim is to decrease fuel usage and the resulting air pollution.

* * *

Campbell's Soups... wide variety...for limited appetites

Many people lose interest in food as they grow older. Some of them are fussy eaters—with only a few favorite foods. Others become indifferent to foods—because planning and preparing meals becomes a chore. Here Campbell's Soups can help —for these four very good reasons:

Appeal With a variety of tastes, textures, aromas, and colors, Campbell's Soups can add interest and appetite appeal. And they're easy to eat—ingredients are tender, bite-size. Even patients on special diets will find soups they can enjoy among the more than 50 different varieties available.

Nourishment Campbell's Soups contain selected meats and sea foods, best garden vegetables—carefully processed to help retain their natural flavors and nutritive values.

Convenience Within 4 minutes a bowl of delicious soup is heated and ready to eat.

Economy Campbell's Soups are inexpensive—an important consideration to those whose budgets are limited.

Recommend Campbell's Soups . . . and, of course, enjoy them yourself. Remember, *there's a soup for almost every patient and diet . . . and for every meal.*

digitalis-diuretic regimens can put a "potassium squeeze" on the myocardium...

therefore this is the logical potassium-sparing diuretic for the digitalized patient

Aldactone®
(spironolactone)

for unique physiologic advantages which no other diuretic can provide

- Does not cause potassium depletion (as do the thiazides, furosemide and ethacrynic acid) which may increase[1] the effect of digitalis on the myocardium, giving rise to premature systoles, ventricular tachycardia or ventricular fibrillation.
- Unique "safety-valve" action due to competitive antagonism[2] of aldosterone helps prevent excessive potassium retention, since endogenous aldosterone production is increased[3] and counterbalances Aldactone action if the serum potassium level becomes too high.
- Hyperkalemia may occur, especially in severely ill patients with relatively small urine outputs or in patients receiving supplemental potassium. However, with Aldactone, because of its mechanism of action, hyperkalemia[3] should be less likely than with triamterene or other agents which act independently of aldosterone.
- Gradual onset of action avoids the danger[4] of sudden electrolyte and fluid depletion.
- May be effective as the sole diuretic or may be combined with a thiazide, furosemide[5] or ethacrynic acid[6].

Indications—Essential hypertension; edema or ascites of congestive heart failure, cirrhosis of the liver and the nephrotic syndrome; idiopathic edema. Some patients with malignant effusions may benefit from Aldactone, particularly when given with a thiazide diuretic.

Contraindications—Acute renal insufficiency, rapidly progressing impairment of renal function, anuria and hyperkalemia.

Warnings—Potassium supplementation may cause hyperkalemia and is not indicated unless a glucocorticoid is also given. Discontinue potassium supplementation if hyperkalemia develops.

Usage of any drug in women of childbearing age requires that the potential benefits of the drug be weighed against its possible hazards to the mother and fetus.

Precautions—Patients should be checked carefully since electrolyte imbalance may occur. Although usually insignificant, hyperkalemia may be serious when renal impairment exists; deaths have occurred. Hyponatremia, manifested by dryness of the mouth, thirst, lethargy and drowsiness, together with a low serum sodium may be caused or aggravated, especially when Aldactone is combined with other diuretics. Elevation of BUN may occur, especially when pretreatment hyperazotemia exists. Mild acidosis may occur. Reduce the dosage of other antihypertensive drugs, particularly the ganglionic blocking agents, by at least 50 per cent when adding Aldactone since it may potentiate their action.

Adverse Reactions—Drowsiness, lethargy, headache, diarrhea and other gastrointestinal symptoms, maculopapular or erythematous cutaneous eruptions, urticaria, mental confusion, drug fever, ataxia, gynecomastia, mild androgenic effects, including hirsutism, irregular menses and deepening voice. Adverse reactions are infrequent and usually reversible.

Dosage and Administration—For *essential hypertension in adults* the daily dosage is 50 to 100 mg. in divided doses. Aldactone may be combined with a thiazide diuretic if necessary. Continue treatment for two weeks or longer since an adequate response may not occur sooner. Adjust subsequent dosage according to response of patient.

For *edema, ascites or effusions in adults* initial daily dosage is 100 mg. in divided doses. Continue medication for at least five days to determine diuretic response; add a thiazide or organic mercurial if adequate diuretic response has not occurred. Aldactone dosage should not be changed when other therapy is added. A daily dosage of Aldactone considerably greater than 75 mg. may be given if necessary.

A glucocorticoid, such as 15 to 20 mg. of prednisone daily, may be desirable for patients with extremely resistant edema which does not respond adequately to Aldactone and a conventional diuretic. Observe the usual precautions applicable to glucocorticoid therapy; supplemental potassium will usually be necessary. Such patients frequently have an associated hyponatremia—restriction of fluid intake to 1 liter per day or administration of mannitol or urea may be necessary (these measures are contraindicated in patients with uremia or severely impaired renal function). Mannitol is contraindicated in patients with congestive heart failure, and urea is contraindicated with a history or signs of hepatic coma unless the patient is receiving antibiotics orally to "sterilize" the gastrointestinal tract.

Glucocorticoids should probably be given first to patients with nephrosis since Aldactone, although useful for diuresis, will not directly affect the basic pathologic process.

For *children* the daily dosage should provide 1.5 mg. of Aldactone per pound of body weight.

NO UNPLEASANT SURPRISES In G. U. Therapy

Urised does not present unpleasant surprises; it brings patient comfort with first dose pain relief. Unlike newer antibiotics or sulfonamides, Urised does not create problems. It has a time-tested record of minimal side effects. The patient gets additional psychological reassurance of Uriseds effectiveness by the evidence of the blue urine.

For over 50 years Urised has created physician and patient confidence by providing effective therapy when needed.

Clinically effective for G.U. Therapy[1-5]

FIRST DOSE PAIN RELIEF

For G.U. Frequency–Urgency–Burning

URISED®

- **CYSTITIS**
- **PYELITIS**
- **TRIGONITIS**
- **URETHRITIS**

Each blue-coated tablet contains these active ingredients:

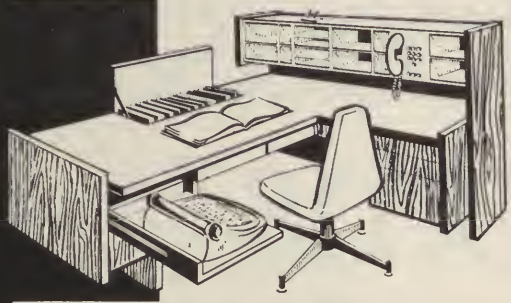
Atropine Sulfate	0.03 mg.	Methylene Blue	5.4 mg.
Hyoscyamine	0.03 mg.	Phenyl Salicylate	18.1 mg.
Methenamine	40.8 mg.	Benzoic Acid	4.5 mg.

Contraindications: Glaucoma, urinary bladder neck or pyloric obstruction, duodenal obstruction and cardiospasm. Hypersensitivity to any of the ingredients.

Warning: Do not exceed recommended dosages.

Precautions: Administer with caution to persons with known idiosyncrasy to atropine and cardiac disease. While under this therapy the urine is blue; patients should be so advised to allay apprehension.

Adverse Reactions: Neither irritation nor untoward reactions have been reported; however, if pronounced dryness of the mouth, flushing, or difficulty in initiating micturition occurs, decrease dosage. If rapid pulse, dizziness or blurring of vision occurs, discontinue use immediately. Acute urinary retention may be precipitated in prostatic hypertrophy.



Dosage and Administration: Adults: Two tablets, orally, four times per day, followed by liberal fluid intake. Older children reduce dosage in proportion to age and weight.

How Supplied: Bottles of 50, 500 and 1,000 tablets.

Since 1883, the most important phase of *Read's* services has been dispensing prescriptions—Because of this, our 2 *All-Nite* prescription service stores were established so that prescriptions could be filled not only during "waking hours", but also after midnight at these 2 All-Nite drug store locations—with complete drug store service around the clock.

Menrium® treats the menopausal symptoms that bother him most.

ROCHE
Roche
LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

His wife has a lot of different
enopausal symptoms, but only a few
ally irritate *him*. Her hot flashes, her
ertigo, her palpitations—that's *her*
roblem. What really bothers him is
er nervousness, her irritability and
er excessive anxiety, often expressed
y endless "book-shuffling, chain-
noking, reading-lamp" insomnia!

Menrium takes care of hot flashes,
rtigo, palpitations in most
enopausal women. Menrium
rovides the well-known antianxiety
tion of chlordiazepoxide (Librium®)
nd water-soluble esterified estrogens.
therefore relieves more symptoms
an either component separately.
takes care of the vasomotor
mptoms as well as the emotional
mptoms. This means the symptoms
at bother his wife most. And the
mptoms that irritate him most.

So, to help them both get through
r menopause, remember Menrium.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of manifestations generally associated with the menopausal syndrome—anxiety and tension, vasomotor complaints and hormonal deficiency states.

Contraindications: Women with cancer of breast or genitalia, except inoperable cases, and those with known hypersensitivity to chlordiazepoxide and/or esterified estrogens.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Exclude other possible causes of menopausal syndrome manifestations, such as pregnancy. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) similar to those seen with barbiturates have been reported following discontinuance of chlordiazepoxide HCl. Potential benefits of use in pregnancy, lactation or women of childbearing age should be weighed against possible hazards to mother and child. Clinical data inadequate on safety in pregnancy.

Precautions: In elderly and debilitated patients, limit dosage to smallest effective amount of chlordiazepoxide (initially 10 mg or less per day) to preclude ataxia or oversedation; increase gradually as needed and tolerated. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects—particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in patients with impaired renal or hepatic function. Paradoxical reactions to chlordiazepoxide (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients. Employ usual precautions in the treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation very rarely reported in patients receiving Librium® (chlordiazepoxide) and oral anticoagulants.

Adverse Reactions: Untoward effects seen with either compound alone may occur with Menrium. With chlordiazepoxide, drowsiness, ataxia and confusion reported in some patients, particularly in the elderly and debilitated; while usually avoided by proper dosage adjustment, these are occasionally observed at lower dosage ranges. Also reported have been a few instances of syncope; isolated occurrences of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido, and occasional reports of blood dyscrasias, including agranulocytosis, jaundice and hepatic dysfunction. Periodic blood counts and liver function tests advisable during protracted treatment. Changes in EEG patterns (low-voltage fast activity) observed during and after chlordiazepoxide treatment.

With estrogens, headache, nausea and vomiting, anorexia, gastrointestinal discomfort, dysuria and urinary frequency, jitteriness, breast engorgement, formation of breast cysts, skin rashes and pruritus occasionally seen. Administration may also be associated with uterine bleeding and/or followed by withdrawal bleeding.

Usual Dosage: One tablet t.i.d. for 21 days, followed by one-week rest periods.

Menrium® T.I.D.

5 mg chlordiazepoxide	5-2	0.2 mg water-soluble esterified estrogens
5 mg chlordiazepoxide	5-4	0.4 mg water-soluble esterified estrogens
10 mg chlordiazepoxide	10-4	0.4 mg water-soluble esterified estrogens

Schering

After only one year:

Administered to more people than live in Dundalk, Annapolis, and Bethesda.*

Injectable Garamycin®
brand of gentamicin sulfate injection

*An estimated 208,000 patients have received GARAMYCIN Injectable to date. The combined population of Dundalk, Annapolis, and Bethesda is 193,500. (Estimated 1969 figures from The New York Times Encyclopedic Almanac 1970.)

See Clinical Considerations section on last page...

Injectable Garamycin®

brand of gentamicin sulfate injection

Schering

ADULT DOSAGE GUIDELINES

See definitive prescribing information in Package Insert.

Patients with Normal Renal Function

Total Daily Dose (administered in two, three, or four divided doses)			
	Less Severe	Resistant/ Moderately Severe	Serious/Life-Threatening
Urinary Tract Infections (due to susceptible strains of gram-negative bacteria)†	0.8-1.2 mg./kg. for 7-10 days	Larger doses or additional antibacterial therapy should be considered in severe urinary tract infections or in resistant cases involving the renal parenchyma or anatomic anomaly.	up to 5 mg./kg.
Other Infections including bacteremia, infected surgical wounds, severe soft tissue infections, and respiratory tract infections (due to susceptible strains of gram-negative bacteria)	3 mg./kg. for 7-10 days		

†Alkalinization of the urine may be a useful therapeutic adjunct.

Patients with Impaired Renal Function

To minimize the risk of ototoxicity in patients with impaired kidney function, only the first dose should be that normally recommended. Each subsequent dose should be half or less of that recommended for patients with normal renal function, depending upon the degree of renal impairment.

In patients with renal failure who are undergoing 14-hour hemodialysis twice weekly, administration of 1 mg./kg. GARAMYCIN Injectable at the end of each dialysis period has been suggested.

Clinical Considerations

Indications: GARAMYCIN Injectable is clinically effective in infections due to susceptible strains of gram-negative bacteria, including *Pseudomonas aeruginosa,* and species of indole-positive and indole-negative *Proteus, Escherichia coli,* and *Klebsiella-Aerobacter.* Bacteriologic studies should be conducted to identify the causative organism and to determine its sensitivity to gentamicin sulfate. Sensitivity discs of the drug are available for this purpose. If the susceptibility tests indicate that the causative organism is resistant to gentamicin sulfate, other appropriate antibiotic therapy should be instituted.

IN VITRO INHIBITION OF CLINICALLY IMPORTANT BACTERIA BY GENTAMICIN SULFATE (TUBE DILUTION STUDIES)

BACTERIA	No. of Strains Tested	No. of Strains (%) Inhibited by: 4 mcg./cc. or less		8 mcg./cc. or less*		No. of *In Vitro* Studies
Staphylococcus aureus	1,210	1,200	(99%)	1,206	(99%)	11
Pseudomonas aeruginosa	885	771	(87%)	828	(93%)	16
Escherichia coli	836	736	(88%)	779	(93%)	11
Indole-positive and indole-negative *Proteus* species	477	210	(44%)	358	(75%)	12
Klebsiella-Aerobacter species	292	205	(70%)	231	(79%)	10

*Number of strains (%) of gram-negative bacteria inhibited by 10 mcg./cc. or less are as follows: *Pseudomonas aeruginosa,* 828 (93%); *Escherichia coli,* 792 (95%); *Proteus* species, 393 (82%); *Klebsiella-Aerobacter* species, 284 (97%). From same studies as above.
Source: Package Insert

This drug should be limited to the treatment of serious infections caused by gram-negative bacteria, particularly *Pseudomonas aeruginosa, Proteus* and other susceptible organisms, with due regard for relative antibiotic toxicity. Therefore, the drug should be considered for use against gram-negative: 1. Bacteremia; 2. Infected surgical wounds; 3. Severe soft tissue infections, including burns complicated by sepsis; 4. Respiratory tract infections; and 5. Selected cases of urinary tract infection.

Contraindications: GARAMYCIN Injectable is contraindicated in individuals with a history of hypersensitivity or toxic reactions to gentamicin.

Warnings: Patients receiving treatment with GARAMYCIN should be under close clinical observation because of the toxicity associated with the use of this drug. Ototoxicity, vestibular and auditory, can occur in patients, primarily those with pre-existing renal damage, treated with GARAMYCIN Injectable, usually for longer periods or with higher doses than recommended.

GARAMYCIN Injectable is potentially nephrotoxic, and this should be kept in mind when it is used in patients with pre-existing renal impairment. Kidney function diminished by infection of the upper urinary tract may, however, improve during effective treatment with GARAMYCIN Injectable.

Concurrent administration of potentially ototoxic drugs such as streptomycin and kanamycin or of potentially nephrotoxic drugs such as polymyxin, colistin, and kanamycin with gentamicin sulfate has not been shown to afford any clinical advantages and, moreover may result in additive toxicity. Monitoring of vestibular, cochlear, and renal function will provide guidance for therapy in such cases.

Precautions: In patients with impaired renal function in who serious infection develops, serum concentrations of the drug m rise, with consequently increased risk of ototoxicity. In these p tients or in those in whom recommended dosage or duration therapy must be exceeded as a life-saving measure, routine studi of kidney function should be performed when possible. These m be supplemented by evaluation of the vestibular and auditory fur tion and measurement of serum concentration of the drug wh feasible. Serum concentrations of gentamicin should be maintain below the range of 10-12 mcg./ml. to reduce risk of ototoxicity.

Ordinarily, treatment should not be given for more than 7 to days or be repeated unless required for serious infection not sponsive to other agents.

As with other antibiotics, treatment with GARAMYCIN Injectal may occasionally result in overgrowth of nonsensitive organisms. superinfection occurs, appropriate therapy is indicated.

Safety for use in pregnancy or the potential for fetal ototoxicity nephrotoxicity have not been established. Studies in pregnant a mals have not revealed teratogenic or ototoxic effects in the fet GARAMYCIN Injectable should not be used in pregnant patients in women of childbearing age unless its use is deemed advisa by the physician.

Adverse Reactions: The overall incidence of ototoxicity conside related to treatment with GARAMYCIN Injectable was 2.8 per c (16 of 565 patients). Contributory factors (two or more factors w relevant to most patients) were as follows: 10 had azotemia, received a total of 1 gram or more of the drug, 7 had recently ceived other potentially ototoxic antibiotics (streptomycin or ka mycin), and 5 were over 60 years of age. Six also had decrea high-tone hearing acuity, which returned to or toward normal the 4 patients retested.

Analysis of BUN data indicated that 4 (2%) of 172 patients show increases in BUN that were probably related to treatment w GARAMYCIN Injectable. Of 20 increases probably or possibly rela to treatment, 7 were reversible, 9 occurred in terminal patients, 4 had no follow-up.

Other adverse reactions associated with treatment were one insta each of urticaria, decreased hematocrit, and reversible depress of granulocytes with normal bone marrow. Other rarely repor and possibly treatment-related adverse reactions were anemia, creased reticulocyte count, rash, purpura, drug fever, hypotens convulsions, twitching, salivation, nausea, vomiting, increased tr aminase activity (SGOT or SGPT), increased serum bilirubin, creased serum calcium, and joint pain.

Packaging: GARAMYCIN Injectable, 40 mg./cc., 2-cc. multiple-c vials, for intramuscular administration.

For more complete prescribing details, consult package inser Physicians' Desk Reference. Schering literature is also avail from your Schering Representative or Medical Services Departm Schering Corporation, Union, New Jersey 07083.

AHFS CATEGORY 8:12.28

Question: What do bullets, cars, and knives have in common?
Answer: These items have produced a rising incidence of bruised, battered and fragmented livers.

The Battered Liver

NEIL NOVIN, MD
Chief, Department of Surgery
South Baltimore General Hospital
Baltimore

Our ability to handle patients with liver injuries expeditiously, and with minimum morbidity and mortality, taxes all of our knowledge and all of our abilities. This is because the liver is such a complex organ.

In fact, it is the only organ present within the individual in which true regeneration and regrowth of new tissue can occur following removal of part of its parenchyma. It even receives a major blood supply from two sources, both of whose minute volume is significant.

During World War II, it was observed by Madding and his group that following a liver injury, a vast majority of individuals showed a large degree of spontaneous hemostasis, most of which occurred prior to the time of exploration. During the early part of World War II, the most significant change in the care of hepatic injuries of the past 25 years occurred.

The previously accepted mode of therapy, ie, using massive packing with long heavy gauze rolls, vaginal packs, etc., with delayed and gradual removal, carried with it a very high mortality and morbidity rate. However, it was soon abandoned in favor of a more direct attack on the specific types of damage found, plus drainage of the areas involved in a posterolateral direction. Accompanying this change in treatment, a much more acceptable death and complication rate was observed.

The majority of wounds sustained by the liver are of the penetrating type. The range of this type of wound progresses from the relatively low velocity stab wound to the very high velocity gunshot wound. All bullet wounds are not alike. There is a great deal of difference between a low velocity .22 caliber target pistol and a high velocity rifle bullet of the same caliber. Yet, there is only a slight difference between bullets of different caliber fired at the same velocity. It is the square of the velocity that is the most significant physical factor in relating the amount of energy imparted to tissue, in relation to the mass and the speed of the missile. $\frac{(E=MV^2)}{2}$

Recent changes in weaponry have been in increasing the muzzle velocity. Our military associates in Vietnam are the major observers of this phenomenon. With the more modern M-16 type high velocity rifles, the damage incurred by bullet wounds today is much more severe than that imparted by a comparable size bullet of yesteryear, including World War II and the Korean conflict.

Civilian life, though, is possibly more hazardous. The civilian arsenal of weapons includes, in addition to the gun and the knife, the automobile.

The higher mortality of blunt trauma can be ascribed to two major factors. First, in the presence of a bullet wound penetrating any body cavity,

Presented under the auspices of the Maryland Trauma Committee of the American College of Surgery during the meeting of the Maryland Chapter on September 6, 1969 in Hershey, Pa., in conjunction with the Semi-annual Meeting of the Medical and Chirurgical Faculty.

there is little, if any, reluctance to surgically explore an individual who has sustained such an injury. Yet there is a degree of delay, procrastination and observation, educated though it may be, that we all go through when we first see a patient who has sustained blunt trauma, before we are convinced that the situation warrants surgical exploration.

Some indication of the mortality rate that can be expected from the nonoperative treatment of liver injury can be garnered from two of many studies that have reached similar conclusions. One from the San Francisco General Hospital supplied by Dr. Madding, and another from Dr. Mikesky, at the Jefferson Davis Hospital in Houston, report mortality rates varying from 62% to 95% in a group of individuals who were found to have had liver injuries but who received nonoperative treatment.

Some authors have stated that not all liver injuries require surgery. This premise requires a good deal of presumption on the writer's part in the absence of exploration, especially since studies, such as those noted above, point out the absolute necessity for surgical treatment of patients sustaining liver trauma.

As recently as 1959, surgeons such as Sloan and Brittain were summarizing the proper approach to the more general problem of blunt abdominal trauma. They stated that the patient with obscure abdominal injury is better treated by early exploration because the diagnosis can be established and the extent of injury more accurately evaluated.

Today, the more conservative point of view is giving way to a more aggressive approach in treating the patient in whom the diagnosis remains in doubt after we have made use of all of our facilities and faculties, including the more sophisticated tools.

The second major factor in relating blunt injuries to a higher mortality rate is the fact that with blunt injuries, severe enough to cause damage to the liver, injuries to other organs often occur. Every major study concerning liver injury clearly demonstrates a progressive rise in the overall mortality and morbidity with each additional organ that is damaged in association with the liver. A summary of these reports showed that a mortality rate of 5% to 10% occurs when the liver is the only organ injured. This rate rose to approximately 20% with another organ injury, and to approximately 35% with two associated organs injured. Reports of 70% to 85% mortality resulted with four or more organs injured in association with the liver.

The pathological processes that are involved in treating liver injuries are: 1. hemorrhage; 2. the products of the liver, ie, bile and bile salts, especially when one thinks about peritonitis secondary to biliary contamination; and 3. any sepsis that may result from either the mechanism of injury (bullet, knife, or bits of clothing) or the operative procedure performed.

These operative procedures, or surgical aspects, include: providing adequate surgical exposure, obtaining hemostasis, performing complete surgical debridement of all devitalized hepatic tissue, and allowing for excellent drainage of the areas of trauma.

Adequate surgical exposure merely means that wounds still heal from side to side across the wound and not from end to end. As long as the exposure is adequate to do what is necessary for the patient and the problems presented, it does not matter what the incision looks like or in what direction it goes.

Following adequate exposure, one must obtain hemostasis and, in doing this, the use of foreign materials, as were mentioned previously, is to be condemned and should be completely discarded, except for their limited use as a temporary expedient during the procedure. This also includes all of the so-called absorbable hemostatic agents, which have been shown by Linstrom in 1955, Blaine in 1951, Hinman in 1949, and more recently by McAllister in 1961, to be not truly absorbable, not truly hemostatic, but which usually function as a nidus for infection or loculation or both. Hemostasis in the liver should be obtained by time-honored methods of clamping and tying, proper application of suture ligatures, and cautery. In a more limited application, cryosurgical techniques, where available, are most useful for hemostasis in liver injuries.

Performing complete surgical debridement of all devitalized hepatic tissue may include, of necessity, major resections or lobectomies. One should, therefore, review what is now known about the anatomy of the liver. Remember that the falciform ligament does not divide the liver into a right and left lobe, but rather divides the left lobe into a lateral and medial segment. Furthermore, remember that the plane of junction of the right and left lobes follows a line roughly 1½ inches to the right of the mid line of the body, passing through the long axis of the fossa of the gall bladder, toward the inferior vena cava as it lies in contact with the liver posteriorally. All of the major divisions of the hepatic artery, portal venous system, and biliary drainage system, basically follow this same pattern as does the hepatic venous drainage, though to a lesser extent.

And last, but by no means least, one must allow excellent drainage of the areas of trauma so that no cavities are left undrained. In discussing drainage, one must include both hepatic parenchymal drainage, which uses various drains, sump pumps, double and triple lumen tubes, etc, and drainage of the common bile duct in major hepatic injuries, so as to insure that no increase in intrahepatic biliary pressure occurs.

With the increasing numbers of trauma cases, more reports of post-traumatic hematobilia are being reported since the first report by Sandblom in 1948. In a 1963 review, Dr. Graff reported that 66 opera-

tions were performed on 20 patients, an average of almost 3½ operations per patient, in which 6 of the 21 eventually died from hemorrhage. Sandblom noted that nonpenetrating lesions of the liver can cause tears in the central part of the liver producing hematobilia. With the number of high-speed automobiles on the increase, we may see more and more of this type of situation.

Reports from other institutions have indicated that prolonged T-tube drainage, in addition to the previously mentioned modalities of treatment, is an important mechanism in helping prevent this most dreaded complication.

Postoperatively, almost all of our analgesic agents cause spasm of the sphincter of Oddi and hence, anticholinergics are indicated to help insure adequate drainage of bile in every direction except into the free peritoneal cavity.

One should be reminded of another physical fact in discussing drainage and that is that these patients remain in the recumbent position most of the time in the postoperative period. A simple rubber drain, stuck through the anterior abdominal wall downward, functions very poorly as a drainage portal, since gravitational forces are far stronger than any physical capillary attraction of even a cigarette-type drain in this anatomical situation. Therefore, it must be emphasized that posterolateral drainage combined with, or in addition to sump-type drainage in the presence of extensive hepatic injury, is necessary.

The surgical approach to hepatic trauma, therefore, can be summarized by a few guides. Do not leave large masses of strangulated tissue or retained foreign bodies within the liver. Do not leave retained segments of devitalized tissue or undrained cavities in the liver. But do drain both the injured areas and the remaining functioning liver tissue after securing hemostasis.

Ancillary measures to be considered both before and during the operation can help protect the liver from the ravages of the injury and subsequent shock. These measures should be considered to make the procedure easier technically.

Hypothermia, which protects the liver during periods of hypoxia, should be used if it is available and the degree of trauma is thought to be significant. It should be prepared for before the patient is placed on the operating room table.

Vascular occlusion of the inflow tract to the liver, using atraumatic clamps in the portal triad, can be of great assistance in handling overwhelming hemorrhage from the liver. These clamps, however, should be removed or at least opened for a few minutes every 15 to 20 minutes unless, as reported by Longmire and others, hypothermia allows a somewhat more prolonged application.

Antibiotics have been reported by some to have been very useful and by others to have shown no statistical significance in changing either death rates or the incidence of complications. However, I feel that in major hepatic trauma, peritoneal lavage, using such things as kantrex or other antibiotics of the surgeon's choice, appear to be a beneficial addition and should be continued in the postoperative period. Lavage of the peritoneal cavity serves as a cleansing or toilet function which should not be disregarded.

Some people have stated in discussing drains that bleeders should be clamped and pus drained. However, as in most cases in surgery, there are no absolutes. I would modify this axiom when it concerns liver trauma and state that in these situations, one should always drain and never be in doubt regarding drainage.

Until a few years ago, resection of a major portion of the liver or even an entire lobe would not have been considered. However, Pack and his group in New York, along with groups in Sweden and Taiwan have in the past 10 or 15 years performed major hepatic resections for varying conditions, including the treatment of the subject under discussion.

In spite of the numerous biochemical and physiological processes that the liver performs, if one gets the patient through the operative procedure, the postoperative biochemical alterations are not insurmountable. However, one must be prepared for some of the more serious abnormalities. One abnormality is the major loss of blood proteins, and another is a severe temporary hypoglycemia, which can be life-threatening.

Significant studies to further delineate these and other abnormalities are now in the process of being reported in surgical literature, the latest study being Dillard's, reported in *Surgery, Gynecology, & Obstetrics*. The two abnormalities mentioned above are relatively easy to handle with the facilities available in most laboratories. They are preventable and treatable with prompt and adequate intravenous replacement. The major difficulties in performing this type of resection, especially in the trauma patient, is the control of bleeding from the very short hepatic veins adjacent to the vena cava, and the prevention of air embolism through these same veins.

Fortunately, formal lobectomy or major resection is only necessary on extremely rare occasions in the treatment of hepatic injury. One should be prepared to deal with it.

It is always reassuring to know that the overall physiological and biological effects of such major operative procedures are not insurmountable and can be handled in most of our general hospitals.

Injuries to the liver, no matter what their inception, can be properly treated today thanks to the efforts of dedicated men, who found the liver not only a complex organ but a challenging one.

It is an interesting paradox that members of a profession committed to the reduction of disease and disability can be so curiously resistant to these same efforts when applied to themselves. But it is true. Physicians are notoriously poor patients. They hate to admit to illness. They minimize or deny its severity. They are slow to seek treatment, and reluctant to accept it. When the help they need is psychological, their reluctance approaches infinity.

Mental Health and the Physician: Who Worries About His?

ROY W. MENNINGER, MD
President
The Menninger Foundation
Topeka, Kansas

Physicians carry burdens and responsibilities which are neither wholly obvious to the public eye, nor readily delegated to someone else. A sense of responsibility for the life of another, an awareness of one's limitations and an apprehension about the consequences of error, and an appreciation of the patient's dependence upon him, are ever-present reminders to the physician of his need to be wise, effective, giving, and capable of carrying the burden of ministering unto others. These same reminders of the need to be strong make it difficult for the physician to manage his doubts and anxieties, and they re-enforce his reluctance to seek relief or support from others.

This lecture, and the three which follow, were delivered at the 1970 Annual Meeting of the Medical and Chirurgical Faculty of Maryland, April 1, 2, and 3. Dr. Menninger's paper was presented under a grant-in-aid from the Merck Sharp & Dohme Postgraduate Program.

Few physicians do seek psychological help of any sort, whether it be counseling, advice, reassurance, guidance, or something more elaborate like psychotherapy or psychoanalysis, even when the problems are compelling. There is little social or personal acceptance for psychological assistance to physicians in momentary need, or in personal crisis. Though both medicine and the public have accepted such concepts of physical prophylaxis as well-baby clinics, annual checkups and the like, there is nothing like this in the psychological realm for either physician or patient. It is still necessary that a physician, who sees a psychologist, be excessively disorganized, addicted to drugs or alcohol, or severely depressed before the justification for his seeking help is at hand.

It is perhaps not surprising that one study has found physicians to use more tranquilizers, sedatives, and stimulants than did a matched control group.

Indeed, abuse of alcohol and mood-altering drugs may be the most common sign of psychiatric illness in physicians. But his need for help is real, if only occasionally acknowledged. How will he recognize it? And where will he find help?

Of these two questions, the first is easier to answer. It will not surprise you to hear a psychiatrist suggest a synonym for that word "help", ie, talk. Talk can be therapeutic for the troubled physician, even as it is for our patients. By verbalizing his anxieties, by talking about the problem which generates them, by examining the alternatives which suggest themselves, the physician, confronted with an anxious situation, simultaneously relieves his distress by the process of talking about it. He facilitates his capacity for problem-solving thought. By transforming feelings into words, feelings become more manageable, less oppressive, and less likely to provoke reactive behavior in the physician.

The second question—where to find the opportunity for therapeutic talk—is harder. It would be well if we had already reached a time when the psychiatrist could play the role of the family physician, as in days gone by. Then his capacity to listen, and to ask questions, could be recognized as a device helpful to the healthy as well as the sick. Regrettably, neither the public nor the practicing physician, nor the psychiatrist himself, is yet prepared for the role that this hope implies. We are not yet at a day where annual psychological checkups are logical and natural. We are not yet at a point where a practicing physician sees the consultative benefit a psychiatrist may have to offer.

Perhaps the next best alternative is to create a group of peers, moderated by a psychiatrist or psychologist, in which the psychological burdens of practicing medicine can be examined, as easily as the psychological problems of the patients are examined in one's practice. Such groups are enormously beneficial, and sometimes powerfully influential for change in healthy directions, but they are hardly universally available. Indeed, not one physician in 100 has access to such a group if he were to want it. But perhaps he could organize it; this I would encourage.

One's wife or one's colleagues are certainly potential sources of assistance, but with limitations in how much one can expect, and how much one can say.

Then, where to turn? Perhaps to be expected, my suggestion will recall an ancient but honorable aphorism: Physician, heal thyself. For indeed, no one else has as much information at hand, so much contact with the problem, or so much awareness of need, as the individual himself. Perhaps our efforts at self-analysis have been less than satisfactory because we have too often asked the wrong questions. Maybe we have failed to diagnose the disorder properly. Maybe we have too quickly asked the question why, or chosen to focus on solutions before we are clear what the problem is.

No matter how available the opportunities for psychological support may be, the physician will continue to live with the special burdens of his practice, and be continually confronted by the anxieties which they bring. My suggestion that we focus on ourselves is likely, therefore, to be a fitting prescription for some time to come.

How are we to go about this? I propose to call your attention to a series of ideas expressed in the form of rhetorical questions, rhetorical because the answers are to be offered to yourself, and not to the public. The questions are intended to be a framework around which you may organize ideas about yourself and your relationships with your environment. Though they are questions which focus on the inner world, they are raised by a psychiatrist. Though they might be considered a kind of "mental health checkup," they will unquestionably strike you as rather nonmedical in nature, and perhaps even more philosophic than scientific. But preeminently, they are pointed and intended to provoke honest thought, which is never an easy task in relation to one's self.

Setting Goals

The first of these questions is perhaps the most global. It invites a review of your life direction. The question I would ask each to consider is this: What are your goals in life? Put otherwise, towards what objectives are you aiming and how realistic are they? How well do they incorporate what is really important to you? And how well do they accurately express your values? Are they for real, or only for show?

The network of interlacing queries arising from the central question provokes several observations. In an era when planning and setting objectives are virtual bywords for every organization, it is ironic to see how few people have adopted the same strategy for themselves. Perhaps we are simply too busy to think about it, too pressured and too overwhelmed by the demands of our daily routine to ever find the time to consider where we are headed, and whence we have come.

Perhaps it is only in late middle age that the lack of a clear sense of direction and the absence of specific goals becomes an appalling reality. Many are those who reach that point in life with a bitter sense of loss and regret. They wonder where time and opportunity have gone. The lack of intrinsic value in the materialistic-oriented goals that some people adopt is obvious, when they helplessly wonder what to do next with their lives, after they have the million dollars that they planned to make. The acquisition of a bigger house, a bigger car, and a

bigger boat, plus all the status that money will buy, has taken on the appearance of a logical goal for many—but does that truly represent their central values?

One cannot think about one's own life goals without asking still other difficult questions. What is, or what are the purposes to which you dedicate your efforts and your lives? What are your personal priorities, and how well does your life's work reflect those priorities? Most of us find such difficult questions easy to avoid, presuming that time will answer them, as indeed it will, though not necessarily to our ultimate satisfaction. Our action-filled lives make procrastination doubly easy, and it is only with the vigor of an intentional decision that we can bring ourselves to stop long enough to ponder such questions. It is to consider just such questions that the benefits of a close, comfortable, and accepting relationship with another person—a spouse, a colleague, a friend, or even a psychotherapist—can be so real. The question is, will you find such an opportunity?

Balancing Priorities

Closely related to that first question about your goals, is one which bears on your use of time and energy. Does your use of your vital resources truly reflect your priorities? Without much thought, most of you would certainly answer "yes," failing to appreciate that for 90% of us the answer is almost assuredly "no."

Executives with broad responsibility are presumed to use their time for the things that are important, such as planning, policy preparation, and making big decisions. With a consistency that is hard to believe, studies have shown that this is rarely true. More often than not, the busy executive is spending 90% of his time on matters that could be done better by others, and are simply a part of the daily routine.

Most of us will recognize in a moment of more somber thought, that the important things in our lives are frequently deferred with a comforting, but self-deceiving assumption that there will always be time tomorrow.

From yet another perspective, there is a high probability that your use of time and energy reflects serious imbalances within the life space of each of you. In spite of public protestations about the importance of the family, about the needs of the community, about the troubles in our world, most of us devote the smallest proportion of our time to these areas. Indeed, it could be fairly said of many of you that you are married to your practice, not your wives. You are invested in your patients, not your children. You are committed to your occupation, not your society.

The point is that these imbalances are decidedly inconsistent with your own statements about what is important and what constitutes your personal priorities. It is this inconsistency which produces a subtle but corrosive tension as your conscience cries out for one commitment, while your activities express another. At times this reflects a distorted conception of responsibility. At times this inconsistency is an impulsive response to the demands of others. Most often it is the outcome of unthinking behavior, the consequence of a general failure to consider your goals, your priorities, and your plans for reaching them.

Nowhere is imbalance in the use of time and energy more obvious than in regard to ourselves. Physicians are dedicated people. For many, this dedication implies, and finally comes to mean considerable self-sacrifice. Time for one's self is discouraged. Pleasure is selfish. One's own needs come last.

Again drawing upon information from a study of executives, less than 40% of some 4,000 executives studied had an avocational pursuit. By inference, they had few sources of personal gratification, and gave themselves few opportunities for fulfilling personal pursuits. Why do they not think better of themselves than that and, are they so different from you?

Acknowledging Responsibility

The third question in my series of rhetorical queries is to ask if your sense of responsibility is also out of balance. In its extreme forms, it is easy to find examples of those who will assume no more responsibility for anything than absolutely necessary. Certainly, the fragmentation of our contemporary culture encourages us to restrict our efforts and our attention to smaller and smaller sectors of the human community. As specialists we demonstrate that same pattern, arguing that the quantity of information is so great that fragmented specialization is inevitable and even advisable. Perhaps it is. But are we guilty of hiding an unduly narrow concept of our responsibility to others behind that rationalization?

Considerably more common in our field of medicine is a pattern that reflects the other extreme. An excessive sense of responsibility keeps us moving like a driven animal. Again, the needs of our patients, the endless calls for our services, make it hard to define a sense of responsibility which simultaneously expresses our commitment to our medical values, and to ourselves, our family, and our world as well. Failing to respond exposes us to the ravages of guilty feelings for failure. Of all the feelings known to the human psyche, guilt is probably the most painful.

It is easy to confuse a concept of responsibility with a command for action, connecting a notion

of obligation with a need to do something about it. When one begins to discover how big the problem is about which he is worrying, his growing sense of helplessness leads him to turn away, disconnect, and assume that someone else will worry instead. A more difficult, but a more effective concept of responsibility is an acknowledgment of the importance of continuing to think about problems and dilemmas, neither turning away in frustration, nor hurling one's self forward into them under the pressure of guilt. Continuing to think about the problems of delinquency in one's community, the need for better school programs for the limited as well as the gifted, and the hundreds of other things for which responsible concern is needed, is a way of staying engaged.

In more personal terms, the concept of balanced responsibility implies a willingness to accept the responsibility for one's own attitudes, feelings, failures, and prejudices. It is worth asking: does each of you demonstrate a readiness to acknowledge your anger, your bias, or your limitations, at least to yourself and to others when this is germane to the situation?

Showing Courage

My fourth query is to ask about your courage, the courage we need to face the internal foe. For we are in most cases our own worst enemies. In the inimitable words of Pogo, "We have met the enemy—and they is us". This kind of courage is exemplified in an ability to look at yourself honestly and fairly, and is an expression of the responsibility I noted earlier. It is not easy to entertain the questions I am posing, without fluctuating wildly between extremes of excessive personal criticism, and total denial that these thoughts have any bearing on you at all. It is this courage which enables us to face, to articulate, and finally to accept our disappointments and losses, one of the most difficult tasks the human psyche faces.

Perhaps this is not so apparent until one stops to realize that life itself is a succession of losses. It begins with the loss of warmth and comfort of the uterus, which nurtured us for the first nine months of our existence. It progresses through the loss of our dependent infant status, the loss of our favorite childhood toys, and the loss of the family, as adolescence separates us from childhood. It is the loss of the irresponsible pleasures of youth with the advent of maturity. It is the loss of jobs, positions, self-esteem, money, and opportunity. It is the loss of one's friends with advancing age, and finally the ultimate loss of life itself. It is something to ponder how extensive is the experience of each of us with loss, big and small, and to note that these are experiences with profound effects upon our mental health. Even as losses vary in their impact upon us, our psychic structure varies in its capacity to handle them, and not all of us do it with equal success.

It has been said that the quality which distinguishes a great man from another like him is his capacity to manage disappointment and loss. One thinks of the experiences of Churchill and the crushing disappointments of his early career, or those of Roosevelt with the disabling onslaught of polio, and begins to realize the wisdom in that observation.

Accepting loss is accepting the reality of it, and then coming to terms with its meanings. Doing so is vital, if the spirit is to continue to grow, and in some cases even to survive. It is relevant to note that the successful rehabilitation of a person newly blind depends upon his first having accepted the reality of his loss of vision, in a process of mourning akin to grieving the loss of a loved one.

It brings me to ask: what can you say about your courage to face and to accept the anguish of loss?

Managing Stress

Germane to any assessment of our mental health is a look at how we manage stress and anxiety. Both are ubiquitous and unavoidable parts of human existence. Each of us has variable reserves and differing means for managing these painful qualities of life. Our methods of managing anxiety are often inefficient, expensive, and even self-defeating.

There are those who deny its existence, others who reject or displace it external to themselves. For others, anxiety provokes acting out, with resort to alcohol, sexual promiscuity, gambling, excessive spending, or frenetic activity. As physicians, we are aware of the frequency with which physical symptoms themselves may be somatic expressions of stress. Are you aware of this pattern in yourselves? The anxiety of responsibility commonly produces an introjected style of managing stress, which provokes depression, a pervasive sense of inadequacy, and even suicide.

The ability to live effectively and compatibly with degrees of tension and anxiety is a mark of emotional maturity. For each of you it is worth asking how well you perceive your own styles of managing stress. How accurately do you characterize it? How able are you to alter it, towards methods which are more effective, less expensive, and less self-destructive?

Examining Relationships

The sixth query is to ask that each physician examine the consistency and the quality of his personal relationships. Most of us accept the truism that people are important to people. Yet we fail to perceive how often human relationships are superficial, meager, and unrewarding. Is this true of you? Which of your relationships can you say has as its essence a quality of involvement with the

other, expressing a depth of emotional investment, which is real and mutually experienced? It is again too easy to explain that the pressures of our lives, and the demands upon us, the superficial materialism of the age and all the rest, are what account for a deep sense of poverty in our relationships with others. To call again upon that element of courage to which I earlier referred, can we examine the quality of the relationships of those who are closest to us, to question how honest, how open, and how real they are?

It is clear that the capacity to establish emotional ties with others is characteristic of emotional maturity. It is clear, moreover, that the work, the effort, and sometimes the pain of doing so is quite enough to discourage many, especially when the trends in our society are moving in the same direction. Yet we are all disdainful of the empty superficiality of the cocktail party, even when it is lessened by the illusion of intimacy, which alcohol can provide.

The phenomenon of parallel play in the nursery school—two children in close physical contact with each other but playing entirely alone—is expectable at the age of two or three. When it can be said to characterize a pattern of living at the age of 20 or 40, it hints at relationships eroded by infantile expectations, and a lack of mutual commitment. Relationships which show a depth of emotional involvement require a willingness to engage, to share, to listen, to give. What can you say about these qualities in your human relationships?

Seeking Support

Not unrelated to a question about your human relationships is a query about sources of your emotional support. From whom do you receive it, and to whom do you give it? I have referred to the lack of fulfilling avocation in the lives of many executives. Does this also describe you?

It is also clear that many people who are imbued with a strong sense of responsibility, many of whom are physicians, have great difficulty in seeking or accepting support from others. For some, this is reminiscent of a profoundly unpleasant sense of helplessness from an earlier phase of life. For some it is an unacceptable admission of weakness or inadequacy, or a contradiction of one's sense of strength and commitment to help others. Ironically, those whose careers lead to increasing reponsibility for others must provide increasing support for others, at the very moment when they are less able to ask for help for themselves. Greater responsibility generates greater personal need, and greater obstacles to receiving it.

The plain fact of the matter is that physicians have dependent needs too, all of our efforts to deny, to rationalize, or to minimize them notwithstanding. We need not pretend otherwise. Some attention to the problem, and some recognition of its existence, is a beginning step in a search for ways to meet our dependent needs, with neither sacrifice to our self-esteem nor compromise of our sense of adequacy. May I remind you again of the importance of a warm and intimate relationship, which permits you to talk about the needs which are there clamoring for fulfillment, but difficult to recognize and embarrassing to acknowledge.

Giving Love

Finally, any survey of your mental health must ask about the role of love in your lives. For most of us, the very use of this word threatens a deluge of sentimentality. It is a word which too readily conjures images of Hollywood and technicolor, cow-eyed adolescents, and the *Ladies Home Journal.* But it is a respectable feeling, and one which forms an important part of the apostolic junctions of the physician. I use it to refer to a capacity to care. For many of us, this is a vital quality in our work with patients. Perhaps we are less aware, however, that it implies a willingness to invest ourselves in others, to be involved with them, to listen to them, in short, to care about them. It should be a hallmark of all our relationships with others. This is the true sense of helping. It is not only the only antidote to hate that we know, but it is also the foundation for that indispensable pillar of human relationships, trust. Both love and trust are always in short supply, but surely no group and no profession is as aware of their importance as is the physician.

Without appearing to promote egocentricity, I would have to ask how truly and how well you love yourself, not in irrational and overblown terms, but as an object of pride and self-esteem, a thing of value, a person of worth. As one can love himself in this mature and realistic way, so he is able to extend the help of love to others, in ways which are not demeaning, not controlling, not condescending or patronizing, but respectful and genuinely caring.

Your relationships to others do indeed mirror your relationship to yourself. How well you deal with others may depend upon your success in managing yourself, in relation to the provocative and difficult questions that I have posed. No one has suggested these questions are easy, in some sense they may be unanswerable. But they do need to be thought about by each of you, talked about with those you love and are close to, and examined repeatedly in the months and years ahead.

Acknowledging the compelling qualities of the irrational in the lives of all of us, Freud once observed that our best defense was our intellect, for as he put it, the voice of the intellect is weak but persistent.

Amos R. Koontz, MD, Memorial Fund Lecture

The Future of Medical Education

GEORGE JAMES, MD
Dean
Mount Sinai School of Medicine
City University of New York
New York, New York

The medical school of the future must accept the responsibility of leadership at the apex of a large pyramid of health and medical curricula for our future health workers. The medical school must play this role within its university and for its community.

Between 1900 and 1964 there was an appreciable decrease in the number of agricultural workers per unit of population.[1] Apparently during these decades our agricultural workers became six times more productive. Let us compare this with health. During the same 64-year period, there was a sixfold increase in the number of health workers per unit of population. Does this mean that our health workers have become only one sixth as efficient? Of course, the true explanation involves the enormous increase in the complexity of medical care. In addition, the unmet needs in health have never been so apparent and the techniques for their solution have never seemed so ineffective and so costly.

The underlying reasons for this discrepancy are obvious. Suffice it to say that medicine has achieved successes which have forced it to confront serious problems that it has not yet learned to solve. The medical armamentarium is becoming more complex and costly since we keep people alive longer and they have more time to suffer more long-term diseases. The increasing education and affluence of our society has increased the visibility of medical need and the stridence of the citizen demands for the requisite care.

We are facing a grave medical care crisis in our society. There is no obvious end in view to the upward spiral of recognition of need, demand for and cost of care. No single plan yet offered or suggested to the American people is the real answer.

What we tend to forget is that it will take time for our civilization to solve its problems. Presently,

there is no available panacea for our health crisis. But there are steps which can be taken now, serious and thoughtful steps, which will lead us on toward ultimate solutions. There are programs which we can think through and develop that will put us in league with the future. These programs will make it possible for us to maximize our present resources and to take the greatest advantage of any new resources our successors develop.

All health programs will require the education of health manpower. Although manpower is not our sole need in health care, it is one of the most crucial and one that is particularly sensitive to any change in federal and state health programs.

The medical school of the future must accept the responsibility of leadership as part of its curriculum for our future health workers.

Some people are deeply concerned that the university must take leadership in such a practical matter. They fear the consequent weakening of our protected, ivory-towered seats of learning. This is a real danger, and the responsibility must neither be offered nor accepted lightly. Yet the public interest demands it—there is no alternative.

The major justification for assuming leadership lies in the nature of the medical care crisis today, and the ultimate hope for its solution. The overall assessment of the present state of medical science in relation to our present killers and disablers must be that at best, it is inadequate.

Medical care is not definitive, because we do not have the requisite scientific base from which to launch crucially effective programs against heart disease, stroke, cancer, arthritis, mental disease, diabetes, nephritis, cirrhosis, diseases of the newborn, and many more.

True, we do help many patients, we do cure some, but our total effort is inadequate to check the present and future case loads. We can promise no large number of new lives that will be saved per unit of new medical care provided and, except in the worst areas of our country, we cannot make a case for a definitive new contribution of selected increments of more medical care.

Under such conditions the essence of progress relates to the improvement of the substantive part of medicine, the product itself. The fruits of new research are required to improve this product and must be rapidly established as part of that product. Therefore, the medical school and its parent university, which sponsors most of the biological research now being undertaken in this nation, is uniquely qualified to take this leadership. The school can lead by supplying the most current definition of "quality" in medicine. We will never solve our medical care crisis until we achieve better quality in medicine. Equality, as outlined in such programs as medicare, medicaid, comprehensive health planning and universal health insurance is important, but it is not, in itself, crucial. Only a future drastic improvement in the quality of the content of medical care itself can be definitive.

It becomes apparent that the deep involvement of the medical school and its parent university in teaching health manpower is essential. Creating the various members of the health team, training them, retraining them, encouraging career mobility, and presenting effective models for the operation of such teams are the functions that the medical school must perform.

It has been reported by everyone looking into the future that we have and will continue to have major shortages in health personnel. Even the enthusiastic devotees of universal health insurance admit that the passage of their favorite legislation would result in tremendous pressures upon existing manpower. The physician augmentation program has received top federal priority, but to date its efforts have borne little fruit. The struggle must continue.

There is also a real danger that the allied health professional field will grow unplanned, uncoordinated, and maybe even unusable. Leadership by the university is sorely needed here. The proper utilization of many groups requires changes in various state medical practice acts. The licensing of these new categories of health workers should involve their membership in a team, working under medical supervision.

It would indeed be a sad commentary on our struggle for real answers if we created vast new entities of solo health practitioners, pursuing a fragmented program at a lower level of health quality than was ever permitted before. This could be the end result of the blind pursuit of equality of access to care, through the creation of an army of allied health workers operating on the basis of present practice mechanisms.

Therefore, let me outline the various categories of medical education, which I hope will concern the medical school of the future.

At the apex of the pyramid will be the continuing education of the physicians of the community. I predict that this program will eventually become the most important function of the medical school. With the rapid advances in modern medicine, re-education becomes a necessity. Eventually, other specialty boards will no doubt follow the example of the American Board of Family Medicine and require re-examination every six years in order for one to be eligible to retain his status as diplomate. State licensure may even be changed to require periodic relicensure in one's medical specialty. Some states have done this for automobile drivers' licenses. Certainly the inadequate physician presents a greater social hazard than does the poor driver.

Physicians in the community will be taught in

effective postgraduate education programs, sometimes playing the role of teacher, sometimes that of student. The instruction will include much more than a few films and lectures. Hopefully it will be practical, serious, and persistent. Whereas undergraduate medical education involves a program of four years, and residency an additional four to six years, postgraduate education will continue for the professional life of the physician—30 years or more. Hence, our finest teachers, our best facilities, our most elaborate efforts, must be given to this program, which is a challenge that few medical schools have yet accepted.

These programs are one answer to the growing threat of iatrogenic disease, whose increase, I feel, will be a logical counterpart to the sharp upward sweep of medical care for the masses. Peer review mechanisms are almost surely coming. These reviews must not merely be embarrassing checkups searching for errors, incompetence, overcharging, overutilization, and other iatrogenic difficulties. Rather, they should be inherently constructive, corrective, educational, and generative of an improved quality of patient care. In short, they should be a real part of postgraduate education.

Refresher courses are becoming essential for today's practicing physicians. One such course conducted at Mount Sinai, a biochemistry overview for practicing physicians, had 50 students attending regularly and faithfully for months. These students, all members of a regular attending staff in the clinical specialties, were quite vociferous in their praise of this program.

Another program which will be of importance and magnitude will be the training of interns and residents. Our future medical school will be associated with a large number of affiliated hospitals. All of the house staff of these hospitals will comprise the student body for an academically-oriented program of graduate medical education.

Any hospital not affiliated with a medical school should be permitted to train the house staff. Such training is part of an academic milieu, not a mere apprenticeship for practical efforts to continue the same varieties of medical care.

The training program should be fully academic and far broader than the usual specialized instruction in knowledge and clinical skills. True academic pursuits should be available. For example, this is the period when the young physician, now closest to his final career specialty, may feel the need for special work in medical economics, computer techniques, group practice, medical care in the ghetto, forensic medicine, medical ethics, biostatistics, and sociology. Certainly he would find such work far more relevant to his immediate future than he would have in his undergraduate medical school days.

By admitting the student for graduate medical education into the medical school rather than into the hospital, the program can be labeled what it should be—an educational one. Moreover, the medical school is in the best position to arrange the most productive rotation plan throughout some of its affiliated institutions, when required for the proper training of the student.

A core of academic courses with a wide choice of electives can permit many residents from different specialties to share certain common general courses. Opportunities for work with community medicine projects would be particularly useful for the future physician, who will face a strong "consumer market" during the coming years.

The next level is that of the undergraduate medical student. Despite the volumes written on the medical curriculum, this curriculum still remains remarkably similar and uniform. Faculty and students can move freely between existing American medical schools and quickly adjust to any so-called innovations which they find.

Current pressures exist for less core programs and more electives; more humanities, community medicine and ecology; earlier career choice in medicine with the early elective of a specialty track; earlier presentation in the curriculum of clinical material; and various programs to shorten the entire period of time for collegiate plus undergraduate education.

Each of these proposals is either presently being applied or is under serious consideration in the medical schools. Each has interesting implications, and several make the stay at medical school more interesting and more adaptable to the individual needs of the student. However, none appears to be crucial to the development of a new physician for the future.

Perhaps the task of the greatest significance to the medical school dean of the future will be that of coordinating the program of undergraduate medical education with other programs. For example, if it is true, as some of us believe, that the new physician will be called upon to act as the captain of a large and complex team of allied health professional workers, then his training program should include a familiarity with the techniques of administration as well as a practical familiarity with what each member of the team can do.

The medical student must also learn the importance of research and development. We must never let the medical student forget that the most poorly trained nurse who holds a syringe of penicillin in her hand is a better physician for the treatment of the patient with lobar pneumonia than was our greatest internist in 1938. Let us not forget that some equally poorly trained health worker in 1990 may well be better equipped to deal with heart disease, stroke, and cancer than we are today.

The student must understand that our only hope

for a major impact upon mankind's diseases lies not in more physicians, not in more allied health workers, not in more and better programs for the delivery of medical care, but in future research. I was appalled recently to receive a set of early questionnaire returns from practicing physicians suggesting that the nation's research effort should be rather sharply curtailed. I trust that our new generation of medical students will not be so inclined. If the profession itself does not search for real answers to the riddle of our major diseases, then indeed, who will?

Another attitude, which we must foster, is the need of the student to be concerned with unmet community needs. While the medical school cannot be responsible for meeting all of these needs, its faculty and students should be aware of all of them. They should be involved with ways of improving the delivery of quality care.

There is an area in South Bronx, New York, which in 1938 had 25,000 people and 50 physicians. It now has double the population (50,000) but only 5 physicians. Such matters must be of concern to medical students. They as physicians will be called upon to provide leadership in solving such problems.

Certainly we are derelict in our duty as teachers if we fail to point out the inadequacies in our health delivery system, and the challenges which exist in attacking it and in providing useful solutions. This is why I feel so strongly that every medical school must have a very strong department of community medicine, engaged in an active program in its community.

Among the allied health professional workers, the elite groups are composed of those with the higher academic degrees. While doctoral degrees are rare and limited to those with teaching duties, there is a small indication that this will change. The doctoral degree has been urged as a reward for unusual technical skill coupled with a great intellectual understanding of the medical care subject. Certainly there is no categorical reason why a doctoral degree should not be given to a nurse who is highly skilled in complex clinical procedures such as cardiac care or renal dialysis.

The master's degree is, of course, a fitting step along the way. As a recognition of very high technical skill and knowledge, coupled with the ability to administer other workers, the master-trained person can take over a large amount of independent responsibility.

The training programs, even if they are designed for people who will fill administrative posts, must give emphasis to the substantive part of medicine.

We at the medical school here at Mount Sinai participate actively in a master's level program at Baruch College in medical care administration. We insist, in this joint program, that the student have rather extensive training in the substantive side of medical care. We believe strongly that a person should have a reasonably good knowledge of what it is he is administering. He should know what the differences are between good and poor care, what the defects are in our medical knowledge, and why research is a priority. He should also know how to organize programs to improve the quality of medical care, and what new medical care complexities are ahead.

We want our new unit administrators to be capable of much independent judgment and initiative. They will soon be administering major neighborhood health centers, rural health centers, group practices, multiphasic screening programs, home care, and extended care programs. Their role is a far cry from the familiar one as handmaiden to the practicing physician, within the confining walls of a large general hospital.

The major traditional baccalaureate program in the health field is nursing. We can, of course, find AA programs, RN programs, and even LPN programs. Our own medical center includes examples of each. Our Mount Sinai RN nursing program, one of the oldest in the country, was turned over to the CUNY college to be run as a baccalaureate program. It is also developing a series of master's level programs based primarily on clinical excellence and specialization. Our affiliate hospitals have the other varieties of nursing programs. We are now in a position to develop working teams of nurses, dovetailing the various types into a single organized unit. Once the nurses settle their own very special role-playing tasks harmoniously, it should be much easier to allocate the remaining tasks within the medical care team.

At CUNY we have another major health manpower effort at the baccalaureate level. This is the Hunter College Institute of Health Sciences which, in cooperation with our medical school, trains people in a rapidly growing number of specialties. Although careful attention is given to these specialties, there is a good solid common core of basic medical science for all of them. Among the present programs are: radiotherapy technology, physiotherapy, health education, communication science and communication disorders, environmental science, and, now in development, the physician assistant.

A unique feature of this program is the large amount of instruction which is given by the staff of the medical school. Although the total effort has only just begun with about 50 students for the year, we estimate that our medical facility has already given over $100,000 worth of academic time to it. There is no reimbursement for this effort.

One particular aspect of this baccalaureate program at Hunter College deserves special comment.

There are two ways to gain admittance to the school. The usual way is directly from high school. But there is another carefully designed curriculum, which can accept the graduate of one of CUNY's community colleges. Such students may be relatively strong in practical techniques but weak in theory. Hence, a curriculum, tailor-made to their needs, has been established.

CUNY has numerous community colleges with huge and still growing enrollments in the health fields. While our medical school makes no attempt to embrace this enormous group, it does have two unique responsibilities.

One of these community colleges, Hostos, has been allocated entirely to the training of students in the health careers. This school is a tight affiliate of the medical school. It is from its students that we hope to round out our medical care teams and to teach all of our medical and allied health students the new patterns of medical care delivery for the future.

There is a grave danger that current pressures in the health field will lead to uncoordinated programs of health training. Already we have seen strange programs develop, such as the community college arrangement to train orthopedic assistants. Moreover, several programs were planned for community college, baccalaureate, or master's levels, with no basic essential differences between the curricula. Clearly there is a need to bring order to the scene.

In response to this obvious need, the chancellor of CUNY has created a special university-wide curriculum committee for the health programs. The chairman of the committee is the dean of the medical school. Its membership includes representatives of college presidents, health program directors, and practicing physicians from the community. Its role is advisory, but its recommendations will no doubt be followed in the great majority of instances.

An important feature of all community college programs is the initial necessity to plan a continuous education effort. Technological obsolescence is a reality to such graduates. The community college must accept the responsibility for their retraining.

Mention has already been made of the problems posed by the medical practice acts in virtually all states. It is essential to our future efforts in total medical education that there be a careful re-examination of each such act. This re-examination must be performed by the largest possible number of involved groups and it should have the strongest of medical leadership. We have already noted the great risks we run from too loose a construction of these acts, which would permit large numbers of new fee-for-service entrepreneurs, with low levels of training, to flood our cities and rural areas.

Equally dangerous would be a narrow construction that would not utilize physician's assistants or not allow them to move freely between states. Perhaps what we really need are less legislative restrictions and more delegation to a public body composed of distinguished physicians and laymen. This body would adjust the rules to fit community health needs on the one hand, and maintain and improve health quality on the other.

Of almost equal significance to the need to overhaul our medical practice acts is the need to overhaul the field of malpractice. The judgment of the quality of medical care must somehow be removed from the courts. No doubt it is our own fault that malpractice decisions have gotten so far out of hand. The medical profession has been unwilling to accept the burden of deciding quality among programs, physicians, and actual physician services. I mention malpractice in the educational context, because it is a vital modifying force.

I definitely believe that medical care programs of the future will involve medical care teams composed of many varieties, and many levels of health professionals working under the leadership of a physician. The pressures for more medical care make it unlikely that any other solution will be as effective. Studies have already shown that this is feasible and that patients will accept it. At The Johns Hopkins, a recent study showed that the residential ghetto-type population was quite willing to accept a primary health visit by a nonphysician member of the team.[2]

At Kaiser-Permanente it has been found possible to screen a patient for a large number of clinical conditions with essentially no medical input for as little as $20 or more for a 2½ hour workup.[3]

The physician is thereby given an extensive profile on his patient, making his time with that patient more efficiently spent. Examples will continue to grow as rural health centers, neighborhood health centers, extended care facilities, and home care programs increase to meet the huge unmet health needs now becoming well recognized.

As these efforts continue, as our population and our governments become more aware of health needs and programs, I expect the medical school to take more leadership. This leadership will extend far beyond its traditional responsibilities to train medical students. It will embrace the entire gamut of the training and retraining of all of the categories of health professional workers.

Harvey Grant Beck Memorial Lecture

The Emerging Physician's Assistant

HU C. MYERS, MD
Alderson-Broaddus College
Broaddus Hospital & Myers Clinic
Philippi, West Virginia

A crisis exists in the delivery of medical services. In order to combat this crisis, and amidst much controversy, the physician's assistant is emerging.

We, as physicians, have the background of medical education and experience necessary to lead the country in making wise decisions in solving the problem of the delivery of medical services. To do this, we must get involved in educational innovation and in experimentation, which is necessary if we are to adapt our rapidly expanding medical science to the changing socioeconomic conditions of our time.

The medical profession has responded to the challenge to extend health care in many ways. Perhaps the most unique, rapidly growing, and controversial program has been the one for the development of a highly-trained assistant for the physician. The first was a two-year program for medical corpsmen started at the Duke University Medical Center by Dr. Eugene Stead in 1965.[1] There are now 40 or more programs, either in operation or being developed. The educational setting, the curriculum content, the length of the program, and the title given to the graduate vary quite markedly. The following

applies to our own program and our experiences with it at Alderson-Broaddus College and Broaddus Hospital.

Reacting to the need for expanded medical services in our area, the trustees and the medical staff of Broaddus Hospital approached the president and officials of Alderson-Broaddus College in 1963 and proposed an addition to the existing allied health programs of the college: a baccalaureate degree program for medical assistants. A committee representing the two institutions met several times to discuss the matter, but made little progress. In 1967, a new committee was formed and a plan for action was agreed upon. Many medical educators both inside and outside West Virginia were consulted. It was the opinion of one of the consultants that the title of this proposed new professional should be "physician's assistant", since this term would be more descriptive of the level of education that was planned for the type of allied health assistant that we would be graduating.

Definition

The physician's assistant is a health professional who works directly under the orders and supervision of a physician. He is educated for this role by taking and completing a series of liberal studies, along with didactic courses and clinical experiences in the medical sciences. His educational encounters stress the need to identify with physicians in modes of thought, patterns of action and reaction, and dedication to moral and ethical value systems. To become professionally competent, he must ultimately achieve the mind-set of the physician. His education is broadly based. He possesses a comprehensive concept of the nature of illness and, because of this, he can intelligently assist the physician in countless ways. The majority of his assignments, however, are concerned with performing more routine or less demanding, yet time-consuming tasks which have traditionally been the work of the physician himself.

The architects of this educational endeavor were three physicians, one educator, and one psychologist under the supervision of, and with the help of, seven other physicians, the college president, a sociologist, a chemist, a minister, four nursing educators, two hospital administrators, and twelve well-known national consultants. These people represented the college administration, the council of the West Virginia State Medical Association, the West Virginia Nurses Association, and the West Virginia University School of Medicine. The consultants were chosen from national organizations or from other medical schools.

Scope of Duties

The physician's assistant, as conceived by the group of designers, would:

1. Take the patient's history and record other patient data.
2. Carry out screening types of routine and special examinations.
3. Do assigned ward work of the physician.
4. Make hospital and nursing home rounds as requested by the physician.
5. Render or assist in first aid in the hospital emergency room or elsewhere.
6. Order laboratory studies, X-ray examinations, etc, as directed by the physician.
7. Assist the surgeon in the operating room, cast room, and elsewhere.
8. Give research assistance as outlined by the physician.
9. Supervise administrative work which may require medical insight.
10. Do certain technical procedures in the absence of a technician.
11. Conduct educational programs such as teaching aides, etc.
12. Instruct patients in their home-care procedures.
13. Carry out such other clinical and research procedures as the assistant's innate ability, plus his education and training permit him to undertake under the guidance of the physician.

The objective sought by such a role was the improvement and extension of patient care. The committee members who worked on the development phase of the program felt that the assistant, who would fulfill this role in an adequate manner, would relieve the physician of at least 30% of his work. This would enable the physician to care for more patients, do additional studies, and carry out research projects.

The question arose as to whether a new occupation should be developed or whether existing ones should be expanded. The only group that could be expanded to fill this unique role without an excessively long period of training seemed to be the graduate nurse who would take additional courses in history taking, etc.

The idea of using nurses for physician's assistants, however, did not seem to be feasible or desirable because nurses are already in short supply and they are also seeking to develop a new role of their own in patient care. A program which could develop a male image, but not exclude females, was thus chosen.

The Need for Assistants

Physicians, like all other people who accomplish much, must be aided by assistants. This was true in ancient times, and it has been increasingly im-

perative as medicine has progressed from the status of an art, to that of a highly sophisticated science, albeit biologic in type and still mixed with a liberal amount of art.

The growing proportion of science in medicine has posed two problems for the profession: 1) How can the accumulated fund of scientific facts be mastered and applied? and 2) Is it feasible and acceptable for an assistant, without an MD degree, to assume some of the role and function which has previously been the sole prerogative of the physician himself? In the past, part of this dilemma has been solved by the fragmentation of medicine into specialties and subspecialties. This is only partially effective in solving the problem, and it soon becomes confusing to the patient and also expensive for him if it is carried to the extreme. Poor practice can result if the patient starts choosing his own specialist, and he no longer secures an appraisal of the overall picture which comes with a general physical examination.

The limiting of practice to a specialty has not decreased the need for assistants because knowledge in the various branches of medicine has developed too rapidly for this effect to occur. The accumulated facts about all specialties are now voluminous. For example, Campbell and Harrison's *Urology* covers 2,800 pages and this material is in an abbreviated form. The subspecialty of gastroenterology as presented by Bockus covers 3,550 pages, also in the form of a summation. When one wants comprehensive data on any of the parts of these specialties, he must read dozens or even hundreds of papers which cover research into the minute details of the particular small area in which he seeks information. It, therefore, becomes apparent that the physician who is attempting to treat patients thoroughly or do research in any field, must have efficient assistance in the gathering of facts.

Acceptability of the Assistant

This brings us to the point of acceptability. Will the patient accept a physician's assistant? Will the physician accept him? Patients have accepted assistants such as medical technologists, radiologic technologists, dietitians, occupational therapists, etc. They have also accepted independent practitioners such as nurses, pharmacists, podiatrists, optometrists, and others. People abroad have accepted independent practitioners of medicine educated on a lower level such as the Russian-Feldsher and the Assistant Medical Officer (AMO) [2] of some of the developing countries.

Pondy [3] and his associates interviewed 72 patients of four physicians who employ assistants to determine the degree of acceptance of the physician's assistants as legitimate members of the health team. They found that there was moderate to high acceptance by 71% of the group and low acceptance by 29%.

Acceptance was largely linked with education and income: It was high in the middle income group and low in both the high and low income groups. It was low also in the poorly educated group. Acceptance increased with the number of years of formal education of the patient. It was high in the small community clinic, apparently because of the shortage of physicians in the rural areas. However, the most important of these factors seemed to be the level of education of the patients. As their education grew, patients were better able to understand how properly trained assistants could help a physician deliver better health care, probably at a lower cost.

Will physicians accept assistants who are trained to do some of the time-consuming work which they alone have been doing in the past? This is a question that cannot be definitely answered at present. However, there are some indications that many of them will. Some of them are enthusiastic about the prospects of obtaining adequately trained assistants while others are hostile to the idea. The best study of physicians' reactions to date seems to be that of Coye and Hansen,[4] who surveyed the 4,000 members of the Wisconsin State Medical Society who were participants in workman's compensation panels. Adequately completed questionnaires were received from 1,345 physicians, 1,299 of which were suitable for computer processing. Sixty-one percent of the respondents believed that assistants were needed; 42% stated that they would use assistants in their practice.

One of the results of this study was the marked difference of opinion as to what the assistant's responsibilities should be. It is natural that this feeling should develop since the movement to produce such an assistant seems to be a minor revolution in medicine. For opinions to be of most value, they must be gathered from a wide variety of sources and sufficient time must be given for opinions to become firm and objective.

It has been interesting to note the changing reaction to the physician's assistant in our own institutions. At first, there was moderate hostility to the idea by many nurses and some physicians. This was discernible when the first students and the first trained assistants arrived on our campus and in our hospital. This hostility rapidly disappeared. In some instances, outward evidence of it completely vanished within a few hours when the trained assistants demonstrated their role in patient care and their competencies in carrying out their assignments or studies, and when, as students, they showed their eagerness to learn and cooperate with physicians, nurses, and allied health personnel.

One frequently voiced reason that some physicians have opposed the idea of training physician's assis-

tants has been that such skilled allied health professionals might try to set up independent practice situations and begin the practice of medicine without a license. This matter has been discussed with the secretary of the Medical Licensing Board of West Virginia.[5] In general, he stated, those who have tried to practice medicine without a license in West Virginia have not been people who have had formal training or education in the allied health fields or even people with college degrees. Rather, most of them have been poorly educated persons or ones with character defects.

In a recently published book on medical licensure, Derbyshire [6] states that the typical successful imposter has a medical background that might consist of a tour of duty as a medical corpsman in the army or as a pharmacist's mate in the navy. He may have been a hospital orderly, a laboratory technician, an elevator operator in a hospital, or even a patient in a mental hospital. From the frequent contacts with physicians which the future imposter thus has, he develops a medical jargon sufficient to fool the unwary.

The students for the physician's assistant curriculum are chosen for intelligence, honesty, integrity, and devotion to duty. They are grounded in the history, philosophy, and ethics of medicine. Every attempt to motivate them to achieve excellence in their pre-professional and professional work is made. They are made keenly aware of the fact that medicine has reached a pinnacle, and that to remain there and go higher, the education of physicians and their associates and assistants in the allied health roles must be constantly revised in an effort to increase their funds of knowledge.

Each one is encouraged to improve his status by additional education, but only through professionally recognized channels. An attempt is made to evaluate the potential of each student, not only before his entrance into the program, but at various times during his college career. From these evaluations, he is offered counsel regarding his remaining in the department, changing his major, or seeking graduate study after his program of studies has been completed.

It is believed that a person who is educated in this way, and survives the many tests of intelligence, competence, and character that the training brings, will be much less likely to violate his code of ethics and the law by starting independent practice than a person who has not been subjected to this type of moral and educational discipline. We feel that any student who has defects in character, competency, or personality adjustment can be detected and eliminated from the program long before he has completed it.

After the preliminary decisions were made, and the necessary educators were secured to do the planning, the college started on an uncharted course to construct an integrated program, one which would give the student the necessary broad range of general as well as professional education courses to enable him to: (1) understand the basic principles of what he was to do and not just how to do it; (2) understand the complex nature of the individual human personality and the social context within and through which he must function; and (3) develop a personal value system which would tend to insure his success in his professional role and function.

It was thought that this would require a combination of liberal studies, professional studies, time for maturity, and the building of a sense of professional responsibility. The development of what is meant by the physician's "mind-set" and other such broad comprehensions are rather long-term educational undertakings. Four years does not seem too long a time in which to securely lay such foundational concepts.

In its report, the Committee on Curriculum Development said, "The contributions of the liberal arts to the student's preparation become functional, as they aid him in comprehending the relevance of mankind's major problems. Illness involves much more than the purely physical.

"Medical science has already demonstrated its understanding of this by making provisions for broad baccalaureate educational requirements for certain types of allied medical personnel, other than physician's assistants. Are their needs and those of the patients with whom they work less demanding than those of other assistants? Will sheer technical competence alone suffice to meet such needs? The college believes not.

"Effective liberal, as well as quality professional education must characterize the program of studies of the physician's assistant. The contributions of these areas must not be segregated. Each must operate upon the other in complementary modes. Therefore, the educational values to be obtained through correlating the general and professional aspects of the curriculum are, in the opinion of the college, best realized through a program in which both areas are simultaneously experienced."

Thus, the foundation for the construction of an integrated program of liberal and professional studies was laid, and the committee, with the help of specialists in various fields, outlined the new courses which needed to be developed, and the clinical experiences which were necessary. After that, the structure of the curriculum was tentatively completed. The committee recognized the fact that changes would become necessary wherever weaknesses were found. This has proved to be the case in a few instances, but there have not been as many as were anticipated.

In September 1968, we admitted our first class of 30 students. We were fortunate in being able to attract students who, for the most part, possessed

the qualities which we felt would make them good physician's assistants, ie, intelligence, honesty, integrity, and cooperativeness combined with energy, loyalty, and service motivations. We started the spring 1970 quarter with 20 freshmen students and 18 sophomores. Twenty-seven of these were young men and women without military experience and 11 were former medical corpsmen. Twenty-four were men and 14 were women—a proportion which indicates that this profession is already developing a male image here and can be expected to attract men who would probably go into a nonhealth field if this type of educational program were not available.

We have been alert to the appearance of weaknesses which have developed during the first two years. We have observed closely not only students, but also some nondegree graduate physician's assistants who have transferred to our program and who have been acting as part-time clinical assistants while working on their degrees. As a result of our observations and experiences we have learned the following:

1. That the difference in the role between a physician's assistant and a nurse must be clearly defined. We have given this question considerable thought and have decided that the nurse is concerned primarily with personal medical care, whereas the physician's assistant is concerned mostly with diagnosis.

2. That where the role of the assistant overlaps that of other allied health personnel, a clear division of responsibility must be made. This has been resolved by assigning primary responsibility for specific tasks to one group and secondary responsibility only to the second group. For example, blood counts are always done by medical technologists, when and where they are available. Physician's assistants are taught to do blood counts but they would not do them except while learning as students, or when working in a physician's office or other situations where medical technologists were not available.

3. That students expect to receive an education which is complete in the aspects of health care in which they will be assisting, and that the level of instruction needs to be commensurate with their needs as graduates.

4. That providing adequately trained physician's assistants to overworked physicians is a practical method of helping preserve that part of medical practice known as the "art of medicine". It will give physicians more time to talk with patients and perhaps rekindle some of the warmth between them.

5. That it is necessary to find a way for students in the physician's assistant program who demonstrate superior qualifications to be admitted to medical school without a time penalty of more than a year.

6. That a deeply interested accredited university or college, with an accredited teaching hospital on the campus or in close proximity to it, is as necessary for the development and conduct of this program as it is for that of the other allied health programs. Cooperating institutions must have faculties and trustee boards with an innovative spirit.

7. That adequate outside funding for the first few years is highly desirable, if not absolutely essential.

8. That a degree program, with an adequate amount of liberal studies, is as necessary as is the professional portion of the curriculum, if the physician's assistant is to be of maximal service.

Conclusions

I am convinced that we are working on an essential requirement for a superior type of clinical medical practice. In the past, physicians have had preceptees and graduate nurses to help them. The medical school faculty has had, and continues to have, interns and residents. But most physicians now must seek help by training their own aides, or by relying on ones with previous experience, or by seeking out those trained by a proprietary school.

This movement is an attempt to furnish the internist, the generalist, and the surgeon with the well-trained assistants that they need so badly. The program also aims to give the basic education necessary for a student to take additional work to become a specialist's assistant if he cares to do so. It is an attempt to capture, nurture, and hold the idealism of youth and direct the energies of a few of them toward helping us care for the sick. If we succeed in taking bright minds and starting them on a search for excellence in this new field and, if we keep them on the right path, then I think our efforts will have been amply rewarded.

J. M. T. Finney Fund Lecture

Pulmonary Embolism — Its Cause and Prevention

WILLIAM H. MORETZ, MD
Chairman, Department of Surgery
Medical College of Georgia
Augusta, Georgia

The partially occluded vena cava seems to be associated with fewer leg sequelae than is the total occlusion of the inferior vena cava. Partial occlusion is preferable to total ligation, except in those patients with small septic emboli which demand ligation, particularly of the ovarian veins and probably of the vena cava as well. The incidental application of a partially occluding clip, in the thrombosis-prone patient, during laparotomy for other conditions is an important concept. This concept may ultimately outweigh in importance the present philosophy of considering surgical interruption of the inferior vena cava only after pulmonary embolism has occurred.

About one out of 100 operations will be associated with some form of intravenous thrombosis in the postoperative period. Considering only major operations, the incidence rises to five or six out of 100. Of those who develop venous thrombosis, 5% to 10% will develop a pulmonary embolus; one third of this number will die.

Predisposing factors are primarily venous stasis, abnormal vein walls, and hypercoagulability of the blood, Virchow's Triad. We can do some things to help prevent the occurrence of venous thrombosis. We can specifically try to accelerate the blood flow, particularly in the lower extremities, by compression with elastic leg bandages, exercises in bed, and early ambulation.

If we are really worried about a patient, we should start the elastic support prior to the time of surgery, since many of the later episodes of venous stasis have their origin during surgery. We can also avoid those things, particularly in the postoperative period, which are known to slow up circulation. Abdominal distention may be prevented by appropriate nasogastric suction. Excessive degrees of dehydration should be avoided, as should certain positions, such as the jackknife position which promotes venous stasis.

The diagnosis of venous thrombosis is first made usually after the occurrence of a pulmonary embolus, manifested by the typical chest pain, cyanosis, dyspnea, and tachycardia. Initial X-rays are likely to be perfectly normal, and only days later may show the characteristic signs. However, there are two ways to diagnose an embolus with certainty. One is by autopsy, and the other is by pulmonary arteriography. Other tests leave much to be desired in accuracy. Scans are valuable but show false positives.

When a patient has venous thrombosis manifested by a pulmonary embolus, treatment is urgently indicated. There is little disagreement that in almost all patients, the best treatment is immediate anticoagulation by heparin. There is some question as to dextran and its effectiveness. However, sodium warfarin (*Coumadin*) and bishydroxycoumarin (*Dicumarol*) are not considered acceptable for early treatment. There are certain patients, though, who require the interruption of the vein.

These patients would be comprised primarily of those in whom anticoagulants are contraindicated strongly; those in whom anticoagulants are being used but have been unsuccessful, since another embolus has occurred even though they are on full heparinization; and those in whom a pulmonary embolus develops even while they are apparently healthy and normally ambulatory.

If we are to interrupt the vein to prevent another pulmonary embolus, there is agreement that this is preferably done at the level of the inferior vena cava. The question then arises as to the best method of interrupting the inferior vena cava. The method which has been used the longest, and with which there has been the greatest amount of experience, is ligation of the inferior vena cava. There are certain difficulties, however, associated with total occlusion of the vena cava, which we would like to avoid, without sacrificing effectiveness in preventing embolism.

As reported by a Dr. Dale in a series of ten patients, in whom he measured the venous pressure response to ligation, there is an immediate appreciable rise which falls rapidly and is only slightly increased after the first few hours. Also, there is a rapid development of collaterals as there must be, or else the patient would die. However, collaterals are never as physiological as the normal pathway, the vena cava.

Studies were made on a model to see whether we might narrow the cava enough to prevent the passage of a sizable embolus and yet not interfere with the blood flow. These studies indicated that within the normal physiological range of 1,000 to 2,000 cc a minute and a pressure of less than 50 mm or 5 cm of water, the vena cava could be narrowed with smooth clips with gaps of 3, 4, or 5 mm. If the gap is smaller than 3 mm, the distal pressure exceeds the physiologic range. We accepted as ideal, clips with gaps of 3, 3.5, or 4 mm, which do not significantly interfere with the blood flow and which do not allow passage of any sizable embolus.

Several methods have been developed for narrowing the vena cava: the smooth clip; the serrated clip; the interrupted sutures placed 5 mm apart through the anterior and posterior vein walls; and the intraluminal sieve, a crosshatching by plastic sutures through the vein wall.

Other methods have also been developed. Whether there is any real advantage of one particular type of partial interruption over another remains to be seen. It seems to me that there is a marked advantage in not having to penetrate the wall of the vena cava and not having anything within the lumen of the vena cava. Therefore, I prefer some device applied to the external surface of the vena cava.

When a clip is applied, or even if the cava is ligated, it is important that the patient continue as soon as feasible with anticoagulants. Nothing done to the vena cava affects the primary problem of intravenous thrombosis. Our routine, after applying the clip, is to first put the patient on dextran for a period of two to three days (one unit daily), and then, unless heparin has been contraindicated, to restart him on heparin for a period of five to six days, followed by sodium warfarin (*Coumadin*) for another two to three months.

Our experience, at this time, is limited to the 72 patients which we have observed for from 1 to 13 years. In this series of 72 patients, indications for surgery were: anticoagulants failed in 30 instances; anticoagulants were contraindicated in 6; embolus occurred while the patient was normally ambulatory in 6; and clip application was done incidental to laparotomy for other disease in 30.

The fourth indication will probably become the most important and the most commonly used one for interrupting the vena cava. In this particular series, 30 patients had the clip applied incidentally during laparotomy for other conditions. Most of these 30 had had a history of previous pulmonary embolus or previous venous disease.

The early mortality rate, 12%, was significant but unrelated in almost all instances to the application of the clip. Most deaths were due to the poor condition of the patient at the time. Of the late mortality rate, 19%, no death was related to the clip procedure or to the recurrence of embolism.

The two things which should be compared to see whether there is an advantage of partial occlusion or total occlusion are: first, their relative effectiveness in preventing recurrent emboli; and second, the undesirable sequelae from the standpoint of the lower extremities.

Recurrent pulmonary emboli occurred in five patients: one patient died of a coronary occlusion on the fifth postoperative day; another had massive venous thrombosis involving most major veins and died on the 28th day; a third had chest pain and a compatible X-ray 2½ years after the operation; the fourth had a probable embolus three years after clipping; and the fifth had a probable recurrence 21 days after clipping. Two other patients were suspected of having recurrence but had negative lung scans.

The experience of others using partially occluding mechanisms has been similar. Seven percent was the average reported recurrence of pulmonary emboli after partially occluding mechanisms. Ten percent was the average with recurrent pulmonary emboli after ligation of the vena cava. From the standpoint of effectiveness in preventing emboli, it seems reasonable to conclude that partial occlusion compares favorably with complete ligation of the vena cava.

In 94 extremities (not patients), no ill effects were observed after the operation. Forty-seven of these had been normal before the clip and 47 had been abnormal. Thirty-six extremities became worse after the clip. Twenty-four had minimal edema, six had moderate edema and only one developed ulceration. Recognizable phlebitis occurred in 11 extremities and 10 developed acute and extensive thrombosis at some time following the clipping procedure.

There was a relationship between previous phlebitis and the development of leg sequelae. There was also a relationship between the presence of occlusion (by phlebogram) of the iliac vein or cava, and subsequent difficulty from the postphlebitis syndrome. Recognizable recurrent episodes of phlebitis occurred almost exclusively in those extremities which had had phlebitis prior to clip application, without relation to proximal occlusion in the vena cava or iliac vein.

Acute massive thrombosis did not occur except in those that had developed occluded proximal veins at either the inferior vena caval or the iliac level, without relationship to the presence or absence of the pre-existing phlebitis of the extremity.

IRENE L. HITCHMAN, MD
Deputy Commissioner
Department of Mental Hygiene
Baltimore

Maryland's New Mental Hygiene Law

In response to a joint resolution of the General Assembly of Maryland, Governor J. Millard Tawes appointed a commission in 1966 to prepare substantive changes, as necessary, in the mental health laws of Maryland. Legislators, lawyers, and psychiatrists were appointed to the commission. Mr. Leon Pierson, a distinguished, practicing lawyer and former United States Attorney for the State of Maryland served as chairman.*

The recommendations of this commission form the basis for Senate Bill Number 210 which was passed by the legislature and signed by Governor Marvin Mandel. It became law July 1, 1970 and is known as the "Mental Hygiene Law". It is intended to be a modernization of the laws relating to the mentally ill and their care. It preserves the basic structure, responsibilities, and duties of the Commissioner and the Department of Mental Hygiene under the Office of the Secretary of Health and Mental Hygiene.

The major substantive changes of interest to the practicing physicians include: a program of mandatory readmission or re-certification of each patient at the end of each year of hospitalization; a requirement for the establishment of complete patient records and their confidentiality; a sweeping revision of requirements as to notification to each patient of the basis of his admission and his rights in regard to such admission.

Definitions

The law includes the following definitions:

Mental disorder is defined as mental illness or mental retardation, or any other form of behavioral or emotional illness resulting from any psychiatric or neurological disorder. It is intended to constitute the basic criterion for care and treatment, and intends to capture all of the possible variations of mental disease, defect or disability.

Mental illness is defined as any mental disorder, other than mental retardation, which so substantially impairs the mental or emotional functioning of an individual as to make it necessary or advisable for the welfare of the person so suffering or for the safety of the person or property of others, that the mentally ill person receive care and treatment. This definition is intended to be medically acceptable and yet sufficiently precise to allow for legal application. The term "mental illness" also replaces the words "insane", "insanity", lunacy", "mentally sick", "mental disease", "unsound mind", and similar words as they appear in the statutes of the State of Maryland.

Mental retardation is defined as a degree of subnormality of intellectual development, expected to be of life duration, which reduces the individual's capability to manage himself or his affairs. The term replaces "defective", "mental defective", "idiot", "feeble minded", and "moron", as they may appear in the statutes of the State of Maryland.

Facility shall mean any clinic, hospital, or other institutions, public or private, other than a Veterans Administration Hospital, which purports to or does provide treatment or other services to persons having any mental disorder.

The section dealing with the admission of patients to mental hospitals has been enlarged and is divided into voluntary and involuntary admissions.

** Other members were: Hon. Thomas M. Anderson, Jr., Hon. Paul A. Dorf, Hon. Arthur Dorman, L. Whiting Farinholt, Jr., Irene L. Hitchman, MD, Edward R. Jeunette, M. Jacqueline McCurdy, Jonas R. Rappeport, MD, Hon. Alan M. Resnick, Hon. M. A. Steinberg, and Donald C. Allen (reporter).*

Voluntary Admissions

The section on voluntary admissions provides that any facility licensed by or under the jurisdiction of the Department of Mental Hygiene may admit for the purpose of care or treatment, or both, any person over the age of 18 years who has a mental disorder which is susceptible to care and treatment and who requests admission to such facility. No person shall be admitted under this provision unless his condition is such that he is able to understand the nature of his request for admission, is able to request his release, and is capable of giving continuous assent to his retention by the facility.

The request for admission may be made by a formal or informal application. Informal voluntary admission may be accomplished simply by a verbal request for admission. The concept of "informal admission" is new. It should be used judiciously in a very small number of cases when, due to his illness, a patient is ambivalent to sign a formal request for admission indicating that he will stay at least three days.

Formal voluntary admissions have not been changed substantially. They require an application in writing on a form designated by the Department of Mental Hygiene. No person admitted on the basis of a formal request may be detained for more than three days after having given notice of his desire to leave the facility, unless his admission status has been changed to an involuntary admission.

A patient admitted voluntarily for care and treatment of alcoholism may be detained by a facility, as before, for a period not in excess of seven days after he has given notice of his desire to leave, unless his admission status has been changed.

No patient voluntarily admitted may be retained by a facility for any period in excess of one year. At the expiration of each one-year period of inpatient residence, the patient has to fill out a new application. A patient originally admitted on an informal basis must execute a formal application to be retained by the facility.

Voluntary admission of a person under the age of 18 is possible on the request of at least one parent or guardian. The person requesting such admission must be able to understand the nature of the request. The request must be formal, written, and assented to by an admitting physician at the facility. No patient admitted under this provision may be retained for more than three days after the person who asked for his admission requests his release, unless the patient's admission status has been changed. No person admitted under this provision may be retained by the facility for any period in excess of one year unless his admission status has been changed. At the expiration of each one-year period of inpatient residence, a new request must be executed by a parent or legal guardian of the patient.

Involuntary Admissions

The new section dealing with involuntary admissions provides that on the application of any person having a legitimate interest in the welfare of the patient, a facility may admit any person who (1) has a mental disorder, (2) needs inpatient medical care or treatment for the protection of himself or others, and (3) is unable or unwilling to be voluntarily admitted to the facility. No liability, either civil or criminal, shall attach to any applicant who makes the application in good faith and with reasonable grounds.

The application shall be in writing and dated on a form required by the Department, or in respect to Veterans Administration Hospitals, meets the requirements of that administration. It should contain a description of the relationship of the applicant to the patient, be signed by the applicant, and be accompanied by the certificates of two physicians indicating that the patient has a mental disorder, and for his protection or the protection of others needs inpatient care or treatment.

Physicians' Certificates

In order to execute a certificate, the physician must be licensed to practice in the State of Maryland. He must not be financially interested by reason of ownership or salary in any private facility in which it is proposed to admit the patient. He must not be related by blood or marriage to the prospective patient or applicant. No certificate shall be used for purposes of admission if based on an examination made more than 30 days prior to receipt of the application for admission.

The important substantive change of this provision is that it allows a physician on the staff of a public facility to execute a medical certificate for a patient proposed for admission to the facility.

The intent of this change is to enable the physicians at the state mental hospitals to re-certify patients on a yearly basis, and to allow for an involuntary admission of a patient under emergency conditions. The regular involuntary admission of a prospective patient will have to be accompanied by two physician's certificates, and a written request from the responsible relative or a person legitimately concerned with the patient's welfare.

Notification of Admission Status

Entirely new is the provision for notification to the patient of his admission status and rights.

The statute requires that within 12 hours after admission to a facility, every patient must be notified of his admission status and the provision of the law pertaining to his admission. This shall be done by reading to the patient the provision under which he is admitted and those provisions pertaining to his rights. A summary should be read to the patient in

clear and simple terms. In addition, the patient should be advised of his right to counsel with an attorney of his choice. If he does not have his own attorney he shall be advised of the availability of the services of the Legal Aid Bureau and Lawyer Referral Services. The patient shall be given the opportunity to call or write his attorney or the agencies specified.

The Department has prepared a form which includes the provisions of this section of the law which may be given to the patient or his relatives or friends. One copy of this form containing a certification of compliance with this section by the person in charge of admissions at the facility must be filed with each patient's record. If the patient is unable to understand the notification and its legal effect, the notification shall also be given to the patient's next of kin, or any other person deemed to have a significant interest in the patient's status. Notification shall be given again to each person at the time of the execution of the new application for admission by both voluntarily and involuntarily admitted patients.

Patient's Rights

Another provision deals with patient's rights. It provides that patients shall at all reasonable times have available writing instruments, stationery, and postage and may use this material to correspond with anyone, subject to such reasonable limitations as may be imposed by the facility. All correspondence shall be forwarded to the addressee without delay and without being opened, except under the direction of the addressee. When for medical reasons limitations are imposed, they must be made a permanent part of the record and must be signed by a physician.

Patients shall at all reasonable hours have access to telephones, and shall be permitted to call any person who has advised the facility in writing of his willingness to receive such telephone communications. When for medical or administrative reasons patients are prohibited from having telephone communications, such prohibition must be made a permanent part of the medical record and signed by a physician.

Every patient is entitled to receive visits from an attorney or clergyman of his choice at all reasonable hours.

When medically justified, a patient may be restricted from receiving visitors other than his attorney or clergyman, if such restriction is made part of the permanent record and is signed by a physician. Refusal of patients to see visitors must also be made permanent parts of their record.

No patient in any facility shall be deprived of his right to vote, receive, hold, or dispose of property unless he has been declared to be incompetent by a court.

Any person who knowingly interferes with the right of a patient in a facility is guilty of a misdemeanor and upon conviction shall be imprisoned for a period not to exceed two years or fined an amount not to exceed $5,000, or both.

Habeas Corpus

At any time, any person admitted to any facility or Veterans Administration Hospital, or anyone in his behalf, may apply to any appropriate court for a writ of habeas corpus to determine the cause and legality of his admission and continued detention.

Judicial Release

In order to obtain a judicial release, a patient or any person having a legitimate interest in his welfare may file a petition in the equity court of the county in which he resides, or resided at the time of his admission. The issues to be determined are: (1) does the patient have any mental disorder and, (2) is the disorder of such a nature that for the protection of himself or others the patient needs inpatient medical care or treatment. If either question is answered in the negative, the patient must be released from the facility. If both questions are answered affirmatively by the jury or court sitting as jury, the patient will be remanded to the facility or Veterans Administration Hospital from which he petitioned his release.

Mental Disorder as a Defense in Criminal Cases

New provisions dealing with pleas of insanity in criminal cases were enacted by the General Assembly in its 1967 session and have not been changed by the commission.

Appointment of Superintendents

Another substantive change provides that the superintendents of state facilities shall be appointed by the Secretary of Health and Mental Hygiene with the advice of the Commissioner, and shall have such qualifications as may be specified by the Secretary. It eliminates the previous requirements that superintendents of mental retardation facilities have to be experienced physicians, and that superintendents of mental hospitals have to be qualified psychiatrists.

The implementation of the new mental hygiene law places a considerable burden on the hospital administration and the medical staff. However, in the long run, it should lead to improvement in patient care.

The members of the commission believed that provisions detailing the civil rights of patients strike a meaningful balance between their rights, the rights of the public to be protected from dangerously mentally ill persons, and the reasonable care and treatment of persons who suffer from mental illness.

your medical faculty at work

by John Sargeant
Executive Director

The Executive Committee met on Thursday, August 6, 1970, and took the following actions:

1. Endorsed, in principle, the following studies that had requested Faculty approval:
   a. Study conducted by Catholic University of America in Washington, D. C., on Differentials in Health Care of the Sensory Deprived
   b. Study and Evaluation of Clinical Laboratory Tests Performed in Physicians' Offices, conducted by William B. Hope, Jr., of The Johns Hopkins School of Hygiene and Public Health
   c. Study of mongolism in Negroes, to be conducted under the auspices of the University of Maryland Hospital
   d. Drug Abuse Treatment Program at Sinai Hospital, which conforms with Faculty guidelines;
2. Agreed to refer to the Maryland Ear, Nose and Throat Society a proposal for a list of those ENT specialists who perform audiometric tests, and an evaluation of the quality of such testing;
3. Declined to review the current system of physician referral provided to members of the public;
4. Approved recommendations for possible appointment of the following physicians to the Medical Advisory Board of the Department of Motor Vehicles:
   William R. Campbell, MD, Salisbury, orthopedist
   Marcus D. Stephanides, MD, Salisbury, orthopedist
   John T. Bulkeley, MD, Salisbury, internist
   William C. Weintraub, MD, Greenbelt, general practitioner
   Paul V. Joliet, MD, Hagerstown, public health
5. Declined to regularly participate in the funding of the MEDIHC program (Military Experience Directed Into Health Careers) through the Maryland Hospital Education and Research Foundation. The program trains discharged or retired military persons for careers in the civilian health field. The committee expressed continuing interest in this program and suggested other means of funding;
6. Regretted its inability to financially assist the founding of Epoch House, a proposed Youth Drug Abuse Rehabilitation Center, even though it recognized the project as worthwhile;
7. Approved computerization of Faculty membership records and expenditure of appropriate funds;
8. Authorized its annual sustaining membership in the Maryland Public Health Association;
9. Determined to proceed with injunctive action against the use of the term "chiropractic physician" and requested an estimate of legal costs for such action;
10. Declined to establish an "Enterprise" telephone number for use throughout the state. (Such a number uses direct dialing techniques, and the long distance charge is billed to the receiving number—in this case, the Faculty);
11. Authorized employment and expenditure of funds for an Actuarial Consultant to analyze the current Professional Liability program and to make any applicable recommendations;
12. Expressed appreciation to the Subcommittee on Maternal Welfare which is currently developing guidelines for therapeutic abortions in the event that Maryland's statute is declared unconstitutional;
13. Approved the nurse-midwife protocol as recommended by the Nurse Liaison Subcommittee;
14. Approved May 12, 13, and 14 as the 1971 Annual Meeting dates, and the location of the meeting as the Civic Center;

15. Approved holding a proposed Symposium on Emergency Room Medical Care, with lunch provided, at St. Joseph Hospital;
16. Authorized the President, President-elect, and Council Chairman to meet with the Editorial Board of the *News American* if such a meeting is arranged;
17. Heard that the Executive Director had been interviewed by representatives of "Nader's Raiders" to discuss peer review, utilization review, and self-discipline;
18. Approved a recommendation of the Nursing Home Liaison Subcommittee to have the Faculty provide consultants to review the cases of those Medicaid patients who have requested a fair hearing concerning the decision made by the Department of Health and Mental Hygiene that they need a lower level of care;
19. Approved a recommendation from the same subcommittee to solicit Faculty volunteers as consultants;
20. Approved a proposal of the Board of Medical Examiners that the Faculty president give "words of welcome" at the biannual medical examinations;
21. Adopted a policy that personnel matters such as employees' salaries and other similar confidential information should not be revealed without written request for and approval from the Executive Committee.

Baltimore City health department

Health Services for Summer Programs

Head Start and Early School Admissions

The City Health Department was active in a number of summer child health programs. For the fifth consecutive year the department administered the health services for the Head Start and Early Admissions programs. Established to aid disadvantaged four and five year olds make better adjustments to school situations, these two programs together served about 800 children.

The City Health Department commitment included a complete physical examination including a neurological evaluation, a dental check-up, tuberculin skin test, urinalysis, a blood test for anemia, and necessary immunizations. Where indicated, parents were counseled for the correction of defects and contacted for follow-up checks on corrections.

These services were arranged for and supervised by John B. Saratsiotis, MD, director of the City Health Department's Bureau of School Hygiene, with the assistance of the Bureaus of Public Health Nursing and Dental Care, local physicians and dentists, the comprehensive medical programs, and other concerned City Health Department bureaus. Funding was provided by federal funds through the City Community Action Agency, Model Cities Agency, and the departments of education and health.

Summer Youth and Educational Enrichment Programs

In the Summer Youth Program, sponsored by the Community Action Agency for the third summer, the City Health Department provided physical examinations and follow-up for 2,600 children, 8 to 15 years old. Examinations were conducted at CAA neighborhood centers.

The department also provided medical evaluations for 1,720 children attending junior high school this fall. These children participated in a summer educational enrichment program. An additional 540 school children were evaluated before participating in summer school swimming lessons conducted by the Division of Physical Education of the city schools.

Mental Health at Camp Jolly Acres

In a new program started June 22, 1970, 60 children with identified behavior problems, ranging from mild to severe, were enrolled at Camp Jolly Acres, Whitehall, Maryland, for up to 24 days. This project was made possible by funds secured under the National Elementary and Secondary Education Act and the joint efforts of the City Health Department's Mental Hygiene Clinics and the City Department of Education. The camp facilities were made available by the Lutheran Social Services of Maryland.

Unlike other camp projects for youth of this type, which are run exclusively for them and often as day camps, the 60 youngsters chosen for this experience lived, ate, and played with a group of normal children. Two city school teachers were present to aid in improving communication skills, including reading ability. Five mental health counselors, under the guidance of Marvin C. Jones, director of the Eastern and Southeastern Mental Hygiene Clinics, were available around the clock to assist the 60 campers and their parents. Total cost for this program was $15,-142.

Hyperactive Children at Black Rock Camp

A second new specialized summer program for youngsters was developed by James D. Chan, Consultant in Physical Therapy in the Department's Comprehensive Children and Youth Programs. Mr. Chan was instrumental in obtaining funds from federal and local sources for 40 hyperactive inner-city children, currently on medication, to attend Black Rock YMCA Country Day Camp at Butler, Maryland.

Identified and selected by The Johns Hopkins Hospital Department of Pediatric Psychiatry and the Diagnostic and Evaluation Clinic, the children had a two-week supervised experience which focused on reading proficiency, writing skills, and improved motor coordination. Total cost of this program was $9,000.

Camp Concern

For the third consecutive year, the City Health Department staff was involved in the Department of Recreation's Camp Concern Program held at the Naval Training Center, Bainbridge, Maryland, for 5,000 disadvantaged youngsters.

For Safe, Sure, Speedy Relief —
— Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, Resinol Greaseless Cream was developed. . . . A doctor's formula containing safe yet powerful ingredients, Resinol Greaseless contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try Resinol Greaseless . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

Remember how great milk of magnesia tasted?

Almost as good as castor oil.
But now you can spare the taste buds and spoil the patient with a modern Dulcolax tablet or suppository.

And Dulcolax works so predictably that the time of bowel movement can often be predicted. Tablets taken at night usually produce a bowel movement the following morning. Suppositories generally work in 15 minutes to an hour.

For preoperative preparation, a combination of tablets at night and a suppository the next morning usually cleans the bowel thoroughly.

Dulcolax suppositories may be particularly helpful when straining should be avoided, as in postoperative care. Keep in mind, however, that the drug is contraindicated in the acute surgical abdomen.

Dulcolax®...it's predictable

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

Clinical Extension of a pure Smooth Muscle Relaxant

TROCINATE®

Brand THIPHENAMIL HCl

400 mg./100 mg. S/C tablets

Trocinate relaxes all smooth muscles. Its direct action (musculotropic) does not involve the autonomic nervous system and it is not mydriatic. It is metabolized by the body and eliminated in the urine as harmless degradation products. Trocinate has a remarkable history of freedom from side-effects.

When a pure direct-acting smooth muscle relaxant is indicated, Trocinate is the drug of choice.

DIARRHEA (functional) . . . *the first 400 mg. tablet usually relieves the discomfort of diarrhea so promptly that it ceases to be a bother.*

DIVERTICULITIS—MUCOUS COLITIS . . . *the accompanying discomforts can be relieved by this direct smooth muscle relaxant.*

BLADDER SPASM . . . *relaxation is immediate. One or two tablets condition the bladder for cystoscopy in one hour.*

SPASTIC URETER . . . *the specific relaxing effect of Trocinate on the spastic ureter has been proven by animal studies and affirmed clinically. (J. Urol. 73:487-93)*

PRESCRIBING INFORMATION

WARNING: Do not give in advanced kidney or liver disease. PRECAUTIONS: Trocinate relaxes all smooth muscles. Large dosage or prolonged usage may cause feeling of weakness or can theoretically precipitate gall-bladder colic, due to relaxing the vascular and duct systems. Caution should be observed in patients with urinary bladder obstruction. DOSAGE: 400 mg. May be repeated in 4 hours. After relief, lengthen the dose frequency. (see side note)

NOTE: *The high therapeutic index of Trocinate permits its administration in dosage sufficient to relieve smooth muscle spasm promptly. 400 mg. dosage usually creates a therapeutic blood level. In reducing dosage after relief, lengthening the time between dosage rather than lessening the recommended dose is preferable. The prompt direct action allows a consciousness of the first suggestion of return of symptom . . . a guide to dose spacing and to determining when treatment is complete. A prescription for twelve or sixteen 400 mg. tablets will usually correct spasm and leave a few tablets for a reserve.*

Recent and Upcoming Library Meetings

The regional meeting of the Washington Area Group of the Medical Library Association, comprised of Virginia, Maryland, Washington, D.C., and newly-acquired North Carolina, will meet in Baltimore at the Health Sciences Library on Saturday, October 24, 1970.

While use of audio-visual media in the library will be stressed, there will be something of interest offered to all types of medical librarians. This program is being jointly sponsored by the Medical and Chirurgical Faculty Library and the Health Sciences Library.

Norman L. Stearns, MD, the Executive Director at the Postgraduate Medical Institute in Boston, will be the afternoon guest speaker.

* * *

The 61st Special Libraries Association annual meeting was held June 7-11, 1970 in Detroit. The keynote phrase of the conference was "The Changing Focus of Special Libraries".

Over 1,400 registrants attended the meetings in Cobo Hall, the immense new convention arena.

Program topics ranged from, "What Will Change? What Must Change"? to "The Peter Principle, Why Things Always Go Wrong", by Dr. Lawrence J. Peter.

Drip stopped, Congestion cleared

For upper respiratory allergies and infections, up to 12 hours clear breathing on one tablet. Dimetapp Extentabs® does an outstanding job of helping to clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely.

INDICATIONS: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, rhinitis, conjunctivitis, and otitis. CONTRAINDICATIONS: Hypersensitivity to antihistamines. Not recommended for use during pregnancy. PRECAUTIONS: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension. SIDE EFFECTS: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered. DOSAGE: 1 Extentab morning and evening. SUPPLIED: Bottles of 100 and 500.

Ritual Execution

Despite abolition of the death penalty, several innocent persons are executed in Hawaii each year. The site of these executions is rather rigidly delineated, being immediately adjacent to a body of water such as a beach, stream, or swimming pool. The victim dives into the water, hits his head against the bottom, sustains a cervical fracture, and floats unconscious to the surface. Well-meaning onlookers rush to the rescue, quickly dragging and carrying him from a watery grave. Unfortunately, they almost invariably forget to support his head, which, acutely hyperextended and rolling from side to side, effectively transects the spinal cord.

Paradoxically, the unfortunate victim is safest while floating in the water, which acts as a total body splint and effectively prevents excessive movements of the head on the trunk. Ideally, after insuring an adequate airway, he should be left in the water until a rigid body support (a surfboard is ideal) can be obtained and slid under the body. He can then be lifted in toto from the water and transported, still lying on the board, to the hospital.

We teach rescue workers on land, to "splint them where they lie." Let's spread the word that for water injuries its "support them where they float!"

Achrocidin® Tablets and Syrup

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen Citrate 25 mg.

ACHROCIDIN Tetracycline HCl—Antihistamine—Analgesic Compound Tablets and Syrup are recommended for the treatment of tetracycline-sensitive bacterial infection which may complicate vasomotor rhinitis, sinusitis and other allergic diseases of the upper respiratory tract, and for the concomitant symptomatic relief of headache and nasal congestion. For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN Tetracycline equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

Lederle LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York 10965 535-9

Drug Effects on Hearts

Two classes of calm-down and pep-up drugs apparently cause heart damage if large doses are consumed over long periods of time, a heart specialist reports. Dr. Carl S. Alexander of Minneapolis tells of finding disturbed heart rhythm, enlargement of the heart, and heart attacks in eight persons who had taken drugs in the phenothiazine tranquilizer family and the imipramine family of antidepressants, or psychic energizers.

Pollution and the Common Cold

City dwellers would have fewer attacks of the common cold—perhaps 10% to 20% less—if polluted air were cleaned up, indicates a three-year study in New York city of colds, weather factors, and air pollution. The research project was conducted by four scientists from the University of Washington School of Medicine, Seattle.

AMA Judicial Council: Treatment of a Family Member

The Judicial Council of the American Medical Association recently issued the following statement regarding the provision of medical care to members of a physician's family: "From time immemorial it has been considered unwise and improper for a physician to treat members of his immediate family for other than minor health problems or in emergencies. For him to do so would be in violation of Section 6 of the Principles of Medical Ethics and therefore unethical.

"Even if for some good reason it becomes necessary to treat a member of his immediate family, a physician should not charge, or make a claim for, or receive compensation for such service from the patient or from a third-party payor on the patient's behalf."

The girth control pill

Tepanil® Ten-tab

(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause *CNS effects* such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic *cardiovascular effects* reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. *Allergic phenamena* reported include such conditions as rash, urticaria, ecchymosis, and erythema. *Gastraintestinal effects* such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

Specific therapy for night leg cramps

NEIL SOLOMON, MD, PhD, SECRETARY

Maryland State department of health and mental hygiene

Fact Sheet For the 1970 Fiscal Year

In 1970, Maryland's hospitals for the mentally ill again treated a record number of patients, reflecting primarily the continuing rise in admissions of alcoholics. Ten years ago these facilities treated 16,268 patients; by 1970, this had increased 59.3%—to 25,919. However, due to shortened periods of hospitalization of new admissions and the gradual, continuing decrease in the number of long-term patients, the average daily size of the patient population declined 17.0% during this period from 8,576 to 7,114.

FISCAL YEAR	AVERAGE SIZE OF PATIENT POPULATION	TOTAL NUMBER TREATED DURING YEAR	ADMISSIONS	TOTAL SEPARATIONS
1960	8,576	16,268	4,640	4,751
1962	8,291	17,580	6,221	6,111
1964	8,035	19,424	7,871	8,104
1966	8,102	21,542	9,675	9,735
1968	7,711	23,598	11,997	12,132
1970	7,114	25,919	14,496	14,664
NET CHANGE	—1,462	+ 9,651	+ 9,856	+ 9,913
PERCENT CHANGE	—17.0	+59.3	+112.4	+108.7

A similar upward trend has been observed in virtually all private psychiatric hospitals, psychiatric units of general hospitals, clinics and other community centers reporting to Maryland's Psychiatric Case Register. For example, total admissions to the 110 clinics are estimated to have increased 12.7% from 19,220 in 1969 to 21,650 in 1970. Since other states have reported comparable data, the question is frequently posed whether or not this reflects a rising incidence of mental illness.

This cannot be readily answered since the ratio between number of individuals treated in psychiatric facilities and total number of mentally disturbed or ill is not known. However, it is generally believed that the rate of occurrence of most mental illnesses has not changed appreciably and that these expanding figures, therefore, primarily reflect the increase in multiple admissions to psychiatric hospitals and clinics for short-term intensive treatment of alcoholism and acute psychoneurotic and personality disturbances. Recent legislation and court decisions have intensified these trends.

Rosewood, the larger of Maryland's two hospitals for the mentally retarded, last year operated as much as 25.2% in excess of capacity and therefore persisted in its policy of restricting admissions to available space and staff. Although the patient population has increased from 2,254 in 1960 to the current 2,744, Maryland's ratio of 86.4 patients per 100,000 state residents is 11.7% below the national average. In an effort to resolve this chronic problem, the department is engaged in a three-pronged program involving construction of new residential retardation facilities on a regional basis, development of coordinated community-based services as alternatives to hospitalization, and removal of emotionally disturbed children from Rosewood, allowing conversion of two buildings for the care of the mentally retarded.

Implications of Recent Maryland Birth Statistics

As in the rest of the United States, the number of live births to Maryland mothers, both white and nonwhite, has decreased steadily in recent years and is now near the lowest level of the past decade.

YEAR	LIVE BIRTHS	BIRTH RATE*	FERTILITY RATE**
1960	77,496	24.8	117.8
1961	78,190	24.5	116.2
1962	76,325	23.6	114.3
1963	78,146	23.2	112.3
1964	79,003	22.8	109.1
1965	74,137	20.9	99.7
1966	72,117	19.9	96.2
1967	69,726	18.9	90.5
1968	68,407	18.2	86.7
1969***	69,000	18.0	85.7

** Number of live births per 1,000 estimated population in specified year.*
*** Number of live births per 1,000 estimated female population ages 15 to 44.*
**** Preliminary.*

Active and extensive family planning programs have existed for some time in Baltimore, as well as in many of the counties, and now encompass the entire state. The resultant availability of the pill and various birth control devices to all population segments has patently played a key role in this decline. Another probable factor is the desire for smaller families, and the ability to attain this objective as reflected in the 42.3% drop between 1960 and 1968 in the number of births of fourth or higher order (from 24,000 to 13,847).

The propounded assumption that this decrease also reflects postponed rather than prevented births appears to be without merit. The birth rate, which relates the number of live births to the size of population, has decreased more than one fourth since 1960, from 24.8 to 18.0 per 1,000.

A somewhat more sophisticated measurement is the fertility rate, since its denominator is limited to the number of women in the child-bearing ages (between 15 and 44). This ratio has declined an average of about 3% a year, from 117.8 per 1,000 in 1960 to a currently estimated 85.7.

The size of this population group is now increasing substantially due to the large number of births in the years immediately following World War II. Because of this, even if the fertility rate decreases further, it is probable that the downward trend in births and in the birth rate will halt or even be reversed in the near future. In fact, preliminary data for 1969 indicate a slight increase in the number of live births although the birth rate continued to decrease. However, the probability that these will return to the high levels of earlier years is remote.

Opinions vary as to future fertility rate trends. Because of a continuing drop in the number of higher order births, Maryland's rate will probably decline for some time, most likely around the 3% a year noted in recent years. Should this be correct, the coming increase in the number of women in the reproductive ages will produce only a moderate rise in the number of births.

The effect of the liberalized abortion law enacted in 1968 is difficult to ascertain. Data indicate that the number of legally performed abortions has been increasing and will probably continue to go up in coming years. Despite this, Maryland's abortion rate is still greatly exceeded by those foreign countries where this procedure is legally permissible and readily attainable. It is, therefore, not possible to determine whether the increase in hospital-performed abortions merely reflects a shift from other previously employed resources or represents a true rise.

Declining fertility rates among all population groups have important implications. For example, maternity wards in Maryland hospitals currently are operating at an average occupancy rate of approximately 60%, a figure which should not rise significantly in coming years. Greater economy and efficiency of operations may therefore be achieved by the conversion of some maternity wards to other uses.

Similarly, consideration might be given to amalgamating or redirecting some pediatric services. Construction of elementary schools, a major capital cost of local government, might be limited in most cases to the replacement of obsolete buildings and to building units in new residential areas. This could release funds for the establishment or expansion of other programs. School boards should find recruitment and retention much simpler than in past years while upgrading faculty levels and reducing teacher-pupil ratios.

One direct effect of the reduction in births has already become apparent. Proportionally, the decrease has been greatest in births of fourth or higher order, many of which have been traditionally to mothers in high-risk groups. Maryland's decline in infant mortality rates in recent years can, in part, be attributed to this. It probably has had the same effect elsewhere as well.

Further improvement in this population index in coming years, resulting from a continuing decrease in higher order births, can be reasonably anticipated. In fact, it is quite possible that Maryland will be able to match the record low rates reported by some foreign countries.

I love my family.
I adore this house.
My in-laws are great.
The neighbors are wonderful.

Indications: For use in management of anxiety and tension occurring alone or as accompanying symptom complex to medical and surgical disorders and procedures. Though not a hypnotic, fosters normal sleep through antianxiety and related muscle-relaxant properties

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep, reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated). Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® (strip pack), Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

The young homemaker: her underlying anxiety and tension can surface and intensify under the continuous stress of rearing a growing family. Especially when she's confined to the home and its environs so much.

You can help her over the rough spots with reassurance and counsel. Equanil can help relieve tension, ease anxiety—with little risk of serious side effects. Time and experience will probably do the rest.

Equanil®

rehabilitation notes

Osteoarthritis of the Lumbar Spine

RENATO S. LAPIDARIO, MD
Assistant Professor
Division of Orthopaedic Surgery
University of Maryland Hospital

Degenerative changes in the spine affect the intervertebral disks and the facet joints. There are several factors that will predispose to the development of osteoarthritis of the lumbar spine. Treatment for acute symptoms include bed rest, analgesics and physical therapy. If conservative treatment fails and if the disabling pain and nerve root signs are present, surgical treatment is indicated.

The lumbar spine, like other supportive structures, is susceptible to degeneration with advancing age.

Degeneration occurs in the cartilaginous portions of the spine and the severity varies in degree in different individuals. Some investigators have postulated that the degree of degeneration seems to be favored by heredity and by concomitant systemic conditions.

Degenerative changes in the spine affect two intervertebral articular systems: the synchondroses (intervertebral disks) and the diarthrodial (facet) joints.[1]

With advancing age, the nucleus pulposus undergoes degeneration and is fissured and deformed. It is gradually replaced by fibrous tissue. The loss of the cushioning effect of the intervertebral disk subjects the articular cartilage of adjacent surfaces of vertebral bodies to excessive pressures. Reactive new bone formation results. Subsequently, there is a growth of bony spurs at the periphery of the vertebral bodies. These marginal spurs may be located at the anterolateral aspect of the posterior portion of the vertebral bodies where they may protrude and embarras the spinal nerve roots. Occasionally, adjacent osteophytes may form bone bridges and unite, so that motion is eliminated at the affected area.

Narrowing of the disk anteriorly puts much stress on the facet joints posteriorly. The articular cartilage of the facets is gradually worn away. Narrowing of the facet joints follows and the opposing surfaces become irregular and sclerotic. As the degeneration progresses, the articular processes usually subluxate and the inferior facet may impinge upon the nerve root. The marginal spurs of vertebral bodies adjacent to the intervertebral foramen may also compress the nerve root. Degenerative changes may also affect the annulus fibrosus so that disk protrusion may result.

Etiology

There are several factors that predispose to degenerative arthritis of the spine: [2]

1. *Direct Trauma to the Lumbar Spine*

In addition to overt bony damage in fractures and dislocations, there is often accompanying damage to the surrounding soft structures and articular surfaces.

2. *Indirect Trauma*

Repeated flexion and extension movements and excessive carrying of loads, particularly when carried to the point of fatigue, predispose to degenerative changes.

3. *Mechanical or Postural Activity*

When proper posture is maintained, body weight is distributed evenly and muscle activity and fatigue are minimal. Improper posture demands increased muscle activity. Excessive stress is imposed on the ligamentous structure of the spine and fatigue appears quickly. The facets subluxate and the articular surfaces gradually undergo degeneration. Deformity in one segment of the spine, as in thoracic kyphosis, increases lumbar lordosis

and imposes heavy strain upon the lumbosacral area. Other deformities, such as scoliosis, pelvic obliquity, and leg length discrepancy, have the same effect. The lumbar spine, which supports the maximum body weight, is also subject to rapid deterioration in obesity.

4. *Antecedent Disease of the Spine*

Conditions that have violated the structural integrity of the lumbar spine will predispose to the development of osteoarthritis. Granulomatous or pyogenic infections or both can damage the spine directly. The infection usually involves the disk space initially and spreads to involve the vertebral body.

Clinical Features

The patient complains of pain and stiffness in the low back area. In the initial course of the disease the stiffness seems to be relieved by activity. The pain is aggravated by bending and lifting of heavy loads. It is relieved gradually with periods of rest. The character of the pain varies and it may be localized or diffuse over the low back area. When there is nerve root irritation, the pain is usually referred to the lower extremity and is aggravated by coughing, sneezing, and straining. Its location follows a dermatomal pattern. There may be accompanying numbness, paresthesia, and muscle weakness.

The range of motion of the lumbar area is limited in all directions. Forward bending is accomplished primarily by flexion of the hips. The normal lumbar lordosis is diminished and the area may be flattened. There may be an accompanying reflex spasm of the paraspinal muscles. If the spasm involves only one side, a scoliosis is present. Localized tenderness, on deep pressure or fist percussion, may be elicited over the affected area. In the presence of nerve root irritation, a positive straight leg raising test is usually present. Sensory, motor and reflex alterations define the specific nerve root involvement.

Radiological Features

These changes are usually seen in the facet joints and the disk interval. There is narrowing of the apophyseal joint at the affected level. The articular cortices are dense and irregular and there is spurring of the margins. The intervertebral space is narrowed and the opposing cortices are dense and irregular. Schmorl's nodes may be present. These are radiolucent defects extending into the subcortical cancellous bone of the vertebral bodies. They are composed of disk material that has penetrated through the soft vertebral end plates. Spurs at the vertebral margins may fuse with one another. Lumbar myelography may help in the diagnosis and localization of disk herniation.

Differential Diagnosis

Since there are so many conditions that can give the same clinical and objective findings, it is important that the correct diagnosis be obtained. For the differential diagnosis, there are four major categories that must be considered in any back problem:

1. *Developmental*

Spina bifida, spondylolisthesis, scoliosis, and congenital malformations are seen in children and young adults.

2. *Mechanical*

There is usually a history of injury. Pain is usually relieved by rest and aggravated by motion.

3. *Inflammatory*

This occurs in the form of tuberculosis, osteomyelitis, etc.

4. *Neoplastic*

This may be primary or metastatic and is more common in elderly patients.

The clinical picture and laboratory findings usually help in reaching the diagnosis.

Treatment

The condition is usually treated with conservative measures. Treatment for acute symptoms should include rest in bed and physical therapy. Slight flexion of the hips and the knees or the Fowler's position is usually the position of greatest comfort. A firm mattress with a board beneath it relieves painful tension and gives support to the back.

Rest in bed should be continued for two to four weeks or until muscle spasm and pain have been relieved. Moist heat is usually effective in reducing the painful muscle spasm. Massage may be used following application of heat. It has been reported by some investigators that the physiological effects of massage are mediated through reflex dilatation of the superficial capillary vessels and relaxation of muscles with gentle stroking.[3] Mechanically, it may also accelerate venous and lymphatic return of the involved part. Pelvic traction or bilateral Buck's traction is recommended by some. It is felt that the benefit obtained from this is not due to traction, but the fact that the patient is resting in bed.[4]

Drugs are used for the control of pain and muscle spasm. For the relief of pain, salicylates, or some of the new synthetic, non-narcotic analgesics are used. Muscle relaxants with tranquilizing effect are effective since most of these patients may also have accompanying emotional tensions. Because of their inactivity, patients at complete bed rest may develop constipation. These patients may need laxatives.

Exercise is usually not indicated during acute episodes since it may aggravate the pain. As soon as the irritability has subsided, moderate exercise to strengthen the back, abdominal and leg muscles is indicated. Exercises should never be carried to the point of fatigue. Excessive exercise is harmful. Dis-

comfort persisting for more than one or two hours following exercise indicates that it has been excessive and should be curtailed.[5]

A corset or brace provides support to the back and also aids in maintaining good posture. Although braces are beneficial they should never be used indefinitely since they may cause muscle atrophy through disuse which, in turn, has a deleterious effect on the lumbar spine. The brace is gradually discarded as symptoms decrease. Before the patient starts to perform his normal activities, he should be examined to see if he has good muscle control and has regained full back motion.

In cases of subacute attacks, during which the symptoms and signs are not severe, ambulatory treatment may be utilized. Treatment is almost the same as above, except that patients are not kept at complete bed rest and the physiotherapy is not as vigorous. Patients with known osteoarthritis of the lumbar spine should be advised to avoid trauma or strain to the back. Heavy lifting or vigorous sports must be avoided. Factors causing excessive strain to the back are corrected together with faulty posture and poor work habits. Obese patients should be encouraged to undergo a program of weight reduction.

Occasionally, a program of conservative treatment fails. If the pain or nerve root signs become disabling, surgical treatment may be necessary. Compression of nerve roots is relieved by foraminotomy. In this operation, decompression of the intervertebral foramina requires removal of much of the facets. This procedure may be combined with a spinal fusion.

Some believe that because of the pre-existing narrowing of the disk spaces and osteophytes at the vertebral margin, stability of the spine is not impaired so that arthrodesis is not indicated. If the osteophyte at the posterior margin of the vertebral body impinges on the nerve root and is accessible, it is removed, although unroofing the foramen is usually sufficient.

When the problem lies only at one site, and if the source of recurrent problem and instability is evident, arthrodesis of the area relieves the symptoms permanently. This is usually true in localized arthritis of traumatic or degenerative origin as in the lumbosacral area.

In the presence of disk protrusion with major neurologic deficit or intolerable pain, removal of the protruding material is mandatory. Advanced age of the patient is no contraindication.[6] Remarkable relief is usually obtained and these patients tolerate surgery well and the prognosis is good.

There is varying opinion with regard to spinal fusion after disk removal. Some of the factors to be considered are age of the patient, occupation, general condition, stability, etc. It is usually preferable not to fuse since foraminotomy is less extensive and convalescence is rapid and easier.

Dietary Salt (Sodium Chloride) Intake and Arterial Hypertension: (Part) 2

ELIJAH SAUNDERS, MD
Instructor in Medicine & Cardiology
University of Maryland School of Medicine

The observations and clinical studies of the role of salt in hypertension must be extended to balance studies in human beings with essential hypertension and those without it. First, it must be noted that the determination of salt intake in humans is extremely difficult. It must be done indirectly, that is, by urinary output which only measures the minimal salt intake. The amount of sodium lost from the skin and other sources can only be estimated. The figures given earlier for certain human groups were based upon urinary output. The point naturally arises as to whether salt appetite is induced or inherited. Experimental studies have shown that this is an acquired phenomenon. Hypertensive patients respond differentially to salt or water loading. Hypertensive patients will eliminate a greater proportion of a salt and water load than normotensive patients. This is nonspecific and may be the effect of arteriolar pressure on increased natriuresis. Studies show that the hypertensive patient excretes a larger amount of sodium than the normotensive person. However, one must not deduce that sodium intake is involved with the pathogenesis of hypertension. In other words, whether this is a cause or effect has not been determined. It could very well be the *effect* of hypertension rather than the *cause*. However, there seems to be no difference between salt requirements in the hypertensive and normotensive patients. Also, no difference between discomfort from salt restriction exists in these two population groups. In studies of hypertensive groups, the salt intake may be high because these patients put out more salt. Therefore, they may have to take in more to maintain metabolic balance. Again, it should be mentioned that potassium may have an antagonistic effect as may have calcium, as far as sodium is concerned. Also, recent observations have suggested that cadmium may have an effect upon hypertension, at least in rats. Rats fed cadmium in their drinking water developed hypertension in a significant number of cases. Cadmium was found in the renal proximal tubules and tended to facilitate sodium reabsorption. Thus, there may be some interaction between cadmium and sodium as a possible etiologic factor in hypertension. One source of cadmium is water left standing in galvanized pipes. The cadmium/zinc ratio may, indeed, be the important factor rather than cadmium *per se*. In 1960, Schroeder [7] reported a correlation in the death rate in the United States with the hardness of water which showed a possible negative relationship. These studies and their significance to the present problem will have to be clarified by further investigation.

The studies cited may be significant to clinical application and public health. By way of review: In populations in which hypertension is a major health problem, dietary sodium may, indeed, be positively associated as a cause. However, the difficulty in measuring sodium intake has been mentioned, as well as the importance of many other factors that may play a role in a given population. Nevertheless, one cannot deny that this particular ion may be important in arterial hypertension. Is there enough information presently available to advise restriction of salt in the diet of the general population as a public health measure? Before one can make this recommendation, it is important to determine whether there could be any possible harm from such restrictions. Balance studies done by Dahl and others have shown that people maintained

on a 275 to 375 mg sodium chloride diet daily are able to maintain normal metabolic balance. Under ordinary circumstances the adaptive mechanisms of the body are so exquisitely effective in conserving salt that intakes of 1 gm to 2 gm a day are more than sufficient for metabolic needs, including periods of growth.[5] Many people, such as Eskimos, American Indians, and certain tribes in Africa, ate only natural foods without salt for years. These people could not have eaten more than 5 gm of salt a day. From a therapeutic point of view, Grollman and Harrison,[8] in 1945, showed that there was an antihypertensive effect of sodium depletion in the rat. Various diets without sodium, such as rice, soy bean, peanut, or potato, resulted in a decrease in blood pressure which could be reversed by adding 2% sodium chloride to the diet of these rats. Survival rates were longer if the lowered blood pressures were maintained. The same was demonstrated less dramatically in dog experiments by the use of natriuretic drugs. From a human point of view, results are quite conflicting because of the unreliability of random samples of blood pressures, the difficulty in dietary control, and the difficulty in estimating the non-urinary sodium loss. Of course, the rice diet of Kempner,[9] which is a low sodium diet, reduced the blood pressure to lower levels in approximately two thirds of his patients.

There is little doubt that restriction of the sodium intake can lower the blood pressure in hypertensive patients. The experience with the diuretic drugs also proves that this can be accomplished. Thus, the use of diuretics in combination with a restricted sodium diet has a definite therapeutic benefit in the hypertensive patient. However, it would be presumptuous to think that this will correct any defects since the actual defect in arterial hypertension is not known. One may say that the restriction of sodium in the diet has a beneficial effect upon blood pressure and may indeed affect the manifestations of the disease but does not affect the fundamental underlying disturbance.

Unless the sodium restriction is severe, one probably would expect very few side effects. Certainly in hypertensive patients this has not been a major problem. However, in the normotensive patient, if the sodium restriction goes below a certain critical level, one may expect anorexia, headache, lassitude, general malaise, nausea, and possibly muscle cramps. Will the prophylactic reduction of sodium in the diet influence the development of essential hypertension? This is a public health problem and one which is probably associated with a number of serious implications. There are not sufficient data to definitely support this possibility affirmatively. However, since a large number of patients in the population are hypertensive without knowing it, and since the blood pressure apparently can be reduced by sodium restriction, it would seem that this would indeed be a beneficial step. Could this be harmful to the normal or ill individual? In certain conditions salt loss may be critical, such as in Addison's disease, but otherwise the possible gains outweigh the liabilities.

Conclusion

Some of the experimental and clinical data support the fact that dietary sodium may indeed be important in the pathogenesis of human essential arterial hypertension. However, it also has been pointed out that this theory is not as clear-cut as it may appear on the surface. There are probably multiple factors operating together and interacting with each other to produce this important clinical entity. To say that any one of these, specifically sodium, is sufficient within itself to produce arterial hypertension is presumptuous. To even say, at this point, that sodium is necessary for the production of arterial hypertension may likewise be presumptuous in that there are hypertensive states that do not respond to either an increase in the sodium excretion or a decrease in the sodium intake. Finally, it seems that no data are available that would tend to mitigate against the widespread employment of restricted sodium diets as a prophylactic public health measure.

Preventing Baldness

When it comes to preventing baldness, researchers have been drawing blanks for thousands of years.

The first known medical record, the Ebers papyrus, written about 1500 B.C., contains a prescription to correct loss of hair.

This ancient Egyptian remedy contained, among other things, fats of the lion, hippopotamus, crocodile, goose, serpent and ibex.

Unfortunately, it didn't work. The feeling was that someone must have left something out.

anxiety: the tyrant

Excessive anxiety can often dominate the patient made vulnerable by illness, surgery, prolonged emotional stress. It can induce or aggravate symptoms, disrupt medical management, divert energy the patient needs for recovery.
The antianxiety action of Librium® (chlordiazepoxide HCl)—used adjunctively or alone—has demonstrated clinical usefulness in virtually every field of medical practice where anxiety complicates the patient's condition.

for the patient ruled by anxiety

Librium® (chlordiazepoxide HCl) 5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.
Contraindications: Patients with known hypersensitivity to the drug.
Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.
Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.
Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Increased interest rates on savings certificates

from Baltimore Federal

Now you can earn increased interest with one of Baltimore Federal's four new savings certificate plans—higher interest that means so much in down-to-earth terms, in the ways you want to enrich life for your family and yourself.

Baltimore Federal now offers 5-1/4% per annum on certificates of $1,000 or more invested for six months... 5-3/4% per annum on one-year certificates of $5,000 and up... a handsome 6% per annum on certificates of $12,000 or more invested for two years ... and an extraordinary 7-1/2% per annum on one-year savings certificates of $100,000 or more. All certificates may be purchased in larger-than-minimum amounts in multiples of $1,000. Interest on all four certificate plans is compounded and credited quarterly, or paid direct to you by check.

Stop in at any convenient Baltimore Federal office and talk over the best savings certificate plan for you. Let Baltimore Federal put a little more of the good life in your life.

A urinary tract infection was eliminated last week

Intestinal monilial overgrowth has appeared this week

For women who are diabetic or debilitated, oral antibiotic therapy often sets the stage for monilial overgrowth in the intestine.

When you anticipate such a problem, take action with DECLOSTATIN 300. It combines the broad-spectrum potency of demethylchlortetracycline with the antifungal effectiveness of nystatin—it helps avoid monilial take-over. Experience has shown DECLOSTATIN to be highly useful for many women patients; individual culture studies will show exactly where this usefulness may best be applied.

It doesn't let monilia begin where bacteria end. Declostatin® 300

Demethylchlortetracycline HCl 300 mg and
Nystatin 500,000 units Capsule-Shaped Tablets Lederle

Effectiveness: Because its antibacterial component is DECLOMYCIN® Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose-related. Transient, reversible, nephrogenic diabetes insipidus with excessive thirst and polyuria (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: One tablet b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

maryland state MEDICAL JOURNAL

VOLUME 19 OCTOBER 1970 NUMBER 10

CONTENTS:

Cerebral Training, Ernst Schmidhofer, MD 51

"Cerebral training constitutes a very highly structured, massively standardized regimen that makes use of neurophysiologic principles rather than psychiatric concepts—cerebral mechanisms instead of mental dynamisms. It is a nonmedicinal, controlled, methodic, organized, sustained training program which concerns itself with the systematic and orderly cultivation of continuing and progressive self-potentiated self-development."

Neurological States Masquerading As Psychoses, Dietrich Blumer, MD 55

"In the absence of clear neurological signs, the recognition of brain disease may be uncertain. This fact applies particularly to those cases in which the specific mental changes indicative of brain disease are not obviously present, but are masked by the signs of emotional disturbances, usually not associated with cerebral pathology."

Diagnosing Organic Psychosis, Lindbergh S. Sata, MD 61

"This paper is concerned with separating those patients with true psychiatric problems from those who have been mistakenly classified as psychiatric, when they unfortunately have organic reasons for their problems—subdural hematomas, brain tumors, multiple sclerosis, etc."

Organic Versus Functional Psychosis: Differential Diagnosis, Virginia Huffer, MD 65

"Physicians frequently encounter patients showing disturbed behavior for whom a differential diagnosis may be both difficult and crucial. This can be especially true as it relates to functional versus organic or toxic psychoses."

NEW DIMENSIONS IN MEDICINE

a program designed to present the current status
and recent developments of medical care
in a variety of fields

for the

173rd ANNUAL MEETING
MEDICAL AND CHIRURGICAL FACULTY
MAY 12, 13, 14, 1971
BALTIMORE CIVIC CENTER

An outstanding **Scientific Program** is being planned to include a pediatric day, lectures by eminent nationally known physicians, sessions on continuing medical education, and medicine and religion.

The annual **Round Table Luncheon** has been scheduled with a variety of timely subjects to be discussed. This will be held in the Civic Center. The annual **Presidential Reception and Banquet** will again be held at the Blue Crest North. A delicious gourmet dinner will be served and there will be an excellent orchestra for dancing.

More space will be available for **Scientific** and **Technical Exhibits. A Hobby Show** for physicians and their families is being planned by the Woman's Auxiliary. The **Health Evaluation Tests,** which have proven such an important part of the Annual Meeting for the past several years, are again being arranged for the members of the Faculty by their fellow physicians.

The new location, the Baltimore Civic Center, will provide attractive modern facilities and ample convenient parking.

FURTHER INFORMATION WILL BE PUBLISHED EACH MONTH IN THE MARYLAND STATE MEDICAL JOURNAL

IMPORTANT DATES – WEDNESDAY, THURSDAY, FRIDAY, MAY 12, 13, 14, 1971
BALTIMORE CIVIC CENTER

Arlie R. Mansberger, Jr., MD, Chairman
Committee on Program and Arrangements

Portrait of a great lover

He doesn't look much like a Casanova or a Don Juan, but he is a great lover. He quietly proved his love by sitting down with the people at Mercantile and planning his estate. Now he knows that those he loves will benefit from his estate in exactly the way he wants them to . . . investment performance goals tailored to his needs with security, maximum tax benefits and, above all else, peace of mind.

If you haven't planned your estate, see your attorney and Mercantile. Over 400 people administer trusts, estates and investment accounts with assets in excess of three billion dollars at Mercantile.

So, be a great lover, call Dick Flanigan at 237-5506 and ask about estate planning.

painless intramuscular therapy for calcium deficiencies:

Calphosan®

calcium glycerophosphate, calcium lactate

To bring effective calcium therapy to the patient, Calphosan may be administered intramuscularly . . . without pain, inflammatory reactions, induration or sloughing. Injections twice weekly for a series of 5 to 10 injections are recommended.

Average dose per injection: One or two 10 ml. injections of Calphosan each week for the first four or five weeks, and on a when-needed basis thereafter.

Calphosan is a specially processed solution of calcium glycerophosphate and calcium lactate, containing 1% of each, in a physiological solution of sodium chloride. Each 10 ml. contains 50 mg. of calcium glycerophosphate, 50 mg. calcium lactate, with 0.25% phenol as preservative. Available in 10 ml. ampules in boxes of 10s and 100s; 60 ml. multiple-dose vials. Also available as Calphosan with B-12. U. S. Patent No. 2657172.

Contraindication: Hypercalcemia; neoplastic diseases; and fully digitalized patients. Do not use intramuscularly in infants and young children. Before starting therapy, consult complete product literature.

Write for free copy of "Calcium: The Ubiquitous and Essential Element" and for samples.

Advertising Regulations

The Board of Medical Examiners has adopted the following regulations regarding advertising by physicians. These now have the full force and effect of law.

All advertising by any person practicing medicine and surgery in Maryland is prohibited except the following:

1. A physician may use a personal professional card of not more than 3½ inches by 2 inches upon which may be printed only his name, title, address, specialty, telephone number, and office hours.
2. Removal notices may be mailed by any physician or surgeon notifying any bona fide patient of said physician or surgeon that he is removing his offices from his present address to the address set forth on said notice. Said notice shall not be more than 5 inches by 7 inches and may only contain the name, title, specialty, telephone number, office hours, and new and old addresses.
3. Announcements may be sent to other physicians indicating that a physician has opened an office, changed the location of an office, or changed the professional composition of his office for the practice of medicine, in a format approved by the Medical and Chirurgical Faculty.
4. Each physician may exhibit the following signs, which shall contain letters not more than 3 inches square and shall be limited to his name, title, degree, and specialty:
   (a) on the door of any office suite that he occupies or uses to see patients
   (b) on the outside of a building in which he either practices medicine or in which he maintains an office suite
   (c) where the location of the building in which he practices or maintains an office suite is a substantial distance from the thoroughfare on which such building is located, an illuminated sign may be located at or near the said thoroughfare as a convenience to the patient. Such illumination shall be by ordinary light and not neon, flashing, intermittent, or in bad or poor taste.
   (d) where an office location is on a corner and the setback from the joint thoroughfare warrants it, a duplicate sign may be permitted for the convenience of the public in approaching from either direction.

ONE-MAN CORPORATIONS

Despite IRS surrender on tax treatment of professional corporations, many attorneys advise against incorporation of one and two-man practices, and of practices not in the top income range. These attorneys cite initial costs of incorporating, the constant red tape, and the problems arising when a physician member dies, as reasons not to incorporate. These same attorneys point to the legal profession itself, noting that lawyers with moderate incomes are staying off professional corporation bandwagons.

SOME GROUPS ILLEGAL

The State Department of Assessments and Taxation is now looking into the professional corporations that have been formed in Maryland. Some do not comply with certain sections of the law, such as the use of PA in their professional name. Others include individuals as shareholders or incorporators who do not hold valid licenses to practice the profession in which the incorporation is made.

CONFUSION ABOUNDS

Non-mathematically inclined physicians can benefit from the following explanation of how Medicare benefits are derived.

In response to a communication from a physician, Blue Shield has advised:

> "The median is the value point at which half the cases in the distribution fall above and half fall below. Thus, if a given service in 1969 which you reported five times, had charges of $75, $125, $135, $150 and $150, the median would be $135.
>
> "The median is higher than the simple average of the lowest and highest, though the mode (the most frequently occurring value) is higher than the median. For comparison purposes only, the arithmetic mean...would be $127."

There you have it.....I'm not a mathematician and I'm still confused.

INCOME COMPARISON

The Wall Street Journal in its Monday, August 24, issue reported that United Air Lines pilots reached agreement

INCOME COMPARISON (cont'd)

with the airline for a salary of $57,000 a year for an 80-hour month. Fringes are extra. This salary is for a 747 pilot; while pilots of the 737 will receive $3,130 a month; 737, three engine, $3,348 a month; and DC8 pilots, $3,793.

RESOLUTION DEADLINE

Resolutions for consideration at the Faculty's Annual Meeting scheduled for May 14, 1971, must be in the Faculty office at least eight weeks prior to that date. This means that resolutions must be received by Friday, March 19, 1971.

1971 SEMIANNUAL MEETING

The El Conquistador Hotel and Club in Las Croabas, Puerto Rico, will be the site of the 1971 Semiannual Scientific Meeting from September 15 to 19. The House of Delegates business session will be held in Maryland, with the place and time yet to be determined.

1971 ANNUAL MEETING

The 173rd Annual Meeting of the Faculty will be held at the Civic Center in Baltimore, May 12, 13, 14. More space will be available for SCIENTIFIC EXHIBITS than ever before. See page 17 of the October Journal for an application form or contact the Faculty office.

MALPRACTICE INSURANCE

Plans are rapidly nearing completion for a study of the Professional Liability situation in Maryland over the past ten years. Recommended to and approved by the Medical Economics Committee and the Council, this study would attempt to identify the "typical" physician or lawyer involved in court action. It would also investigate such factors as the educational background of those professionals sued, the justness of the suits, and the amount of settlement that finally reaches the claiman

In other developments, the Louisiana Insurance Commissioner recently approved increases in the premiums in that State's program which is substantially higher than Maryland's. For Class III, 100,000/300,000 coverage would be $905.97, compared to Maryland's $489 under the Faculty program.

NOT A CURE ALL—BUT
THE BEST AIDE KNOWN

Will everyone get his fair share?

Uncle Sam doesn't really want more than his share. But he often gets it when someone neglects to make a will. Or when a trust officer and lawyer have never been consulted about the many ways estate taxes may be minimized under today's complicated tax and inheritance laws.

Maryland National's Trust Department is widely experienced in all phases of creating and administering trusts. And we have an investment performance record we'll proudly compare with any other.

maryland national bank
TRUST DEPARTMENT

So talk with your lawyer. Then talk with us. Just call 962-6684 and ask f Jack Boadway. He and your lawyer will help make sure that what you've worked so hard for will keep right o working hard, and that your heirs wi get their fair, and full, shares.

Doctors take note...

The girth control pill

Tepanil® Ten-tab
(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic cardiovascular effects reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. Allergic phenamena reported include such conditions as rash, urticaria, ecchymosis, and erythema. Gastrointestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

May 12, 13, 14, 1971
Baltimore Civic Center

More space is available than in former years. However, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

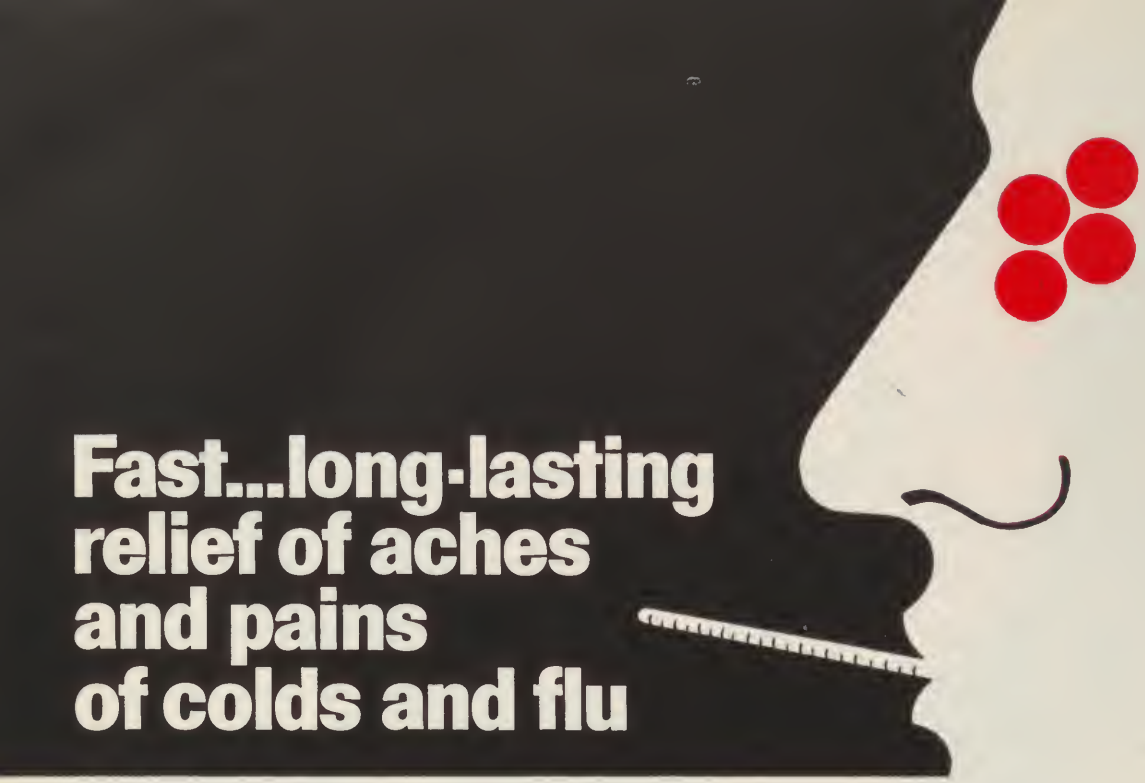
_____

5. Has exhibit been shown at other medical meetings? _____

_____

6. Name and title of exhibitor: _____

_____



7. Name of institution cooperating in the exhibit: _____

_____

8. Address of exhibitor: _____

_____

Fast...long-lasting relief of aches and pains of colds and flu

with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 6,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

The actions of the official Tincture and Extract of Belladonna result chiefly from their Atropine content . . . conclude Goodman and Gilman

THE PHARMACOLOGICAL BASIS OF THERAPEUTICS
3rd Edition, page 522

ANTROCOL®

Antrocol provides the prompt, predictable antisecretory action of the belladonna alkaloid, atropine, fortified with sedation and blended with Bensulfoid, contributing to even absorption.

Each tablet or capsule contains: Atropine sulfate, 0.324 mg.; Phenobarbital, 16 mg. (may be habit forming); Bensulfoid, 65 mg. (see white section PDR). The atropine content of Antrocol is the maximum amount the average patient can take at six hour intervals over long periods with comfort.

SUPPLIED
Tablet in bottles of 100, 500 and 5000
Capsule in bottles of 100, 500 and 1000

Caution: Federal law prohibits dispensing without prescription.

PRESCRIBING INFORMATION

Contraindicated in glaucoma. Use cautiously in prostatic hypertrophy. Side-effects of toxic dose of atropine: flushing, dryness of mouth, cycloplegia, tachycardia and urinary retention.

DOSAGE: One tablet or capsule after each meal to correct emotional stress and normalize gastric secretions. In treating peptic ulcer, doses at regular intervals up to eight (8) tablets or capsules per day to provide the proper gastric titer for healing. After ulcer has healed, one tablet or capsule after each meal to maintain a titer unfavorable to recurrence.

Clinical supply available to physicians.

Roche announces

Efudex®

(fluorouracil) cream/solution

for the treatment of solar/actinic keratoses... a topical alternative to conventional therapy

1/22/68—Treatment with 5% 5-FU cream commences. Patient K.L. showing widespread but mild solar keratoses (also known as actinic keratoses).

Fluorouracil—the Roche contribution

In 1962, Roche Laboratories introduced Fluorouracil Roche® (5-fluorouracil). Early clinical work with this drug suggested that it possessed a selective cytotoxic activity when applied topically to certain kinds of lesions. Based on this work and years of clinical trials, a standardized form of topical fluorouracil can now be recommended for treatment of multiple solar or actinic keratoses.

Efudex®(fluorouracil)—a new alternative to conventional therapy

Efudex presents the physician with a topical alternative to surgery in the treatment of solar or actinic keratoses. It is effective, comparatively inexpensive and especially well-suited for treatment of multiple lesions. Important, too, is the highly desirable cosmetic result. Clinical experience demonstrates that treatment with Efudex results in an extremely low incidence of scarring.*

Highly effective on first and later applications

In clinical trials, depending on the dosage form and strength used, complete involution occurred in 77 to 88 per cent of lesions following treatment. The rate of recurrence was low, ranging from 1.7 to 5.6 per cent up to a year after completion of therapy. When lesions did recur or new ones appeared, repeated courses of Efudex therapy proved effective.*

/2/68—After 11 days of treatment. rythema is seen at site of keratoses. In ddition, numerous lesions not apparent rior to therapy have become manifest y sharply defined reactions. Intervening kin, also treated, shows no response to herapy.

/19/69—One year after cessation of herapy. Skin appears clear with no evi- ence of scarring. Examination reveals ck of recurrence or the formation of ew lesions.

Predictable sequence of therapeutic response

Two to four weeks constitutes a typical course of Efudex therapy. The response is usually characteristic and predictable. After three or four days of treatment, erythema begins to appear in the area of the keratoses. This is followed by an intense inflammatory response, scaling and occasionally moderate tenderness or pain. The height of the inflammatory reaction generally occurs two weeks after the start of therapy, and then begins to subside as treatment is stopped. Within two weeks of discontinuing medication, the inflammation is usually gone. A mild erythema may remain for two to three months before gradually receding.

Selective—with a high degree of safety

Despite the temporary unsightliness and discomfort of the inflammatory episode, Efudex is, in general, more readily tolerated than surgery. Clinical work shows the intense inflammatory response to be limited to the area of the lesion. Normal skin is not similarly affected. Another measure of Efudex safety: systemic absorption of topical fluorouracil was insignificant, indicating a low risk of systemic toxicity.*

Two strengths—two convenient dosage forms

Efudex is available as a 2% or 5% solution or as a 5% cream. It is applied twice daily by the patient with a nonmetal applicator or suitable glove.

Before prescribing Efudex, however, there are two important considerations. First, please consult the complete prescribing information for precautions, warnings and adverse reactions. Second, advise the patient that treated lesions should respond with the characteristic but transient inflammation. A positive sign that Efudex is working for them.

*Data on file, Hoffmann-La Roche Inc., Nutley, New Jersey.

2% and 5% Solutions; 5% Cream Applied twice daily—resolves solar or actinic keratoses.

new Efudex® (fluorouracil) cream/solution

For full prescribing information, please see the following page.

Roche introduces

Efudex®

(fluorouracil) cream/solution the new standardized topical for solar/actinic keratoses

Description: Efudex solutions and cream are topical preparations containing the fluorinated pyrimidine 5-fluorouracil, an antineoplastic antimetabolite.

Efudex Solution consists of 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris-(hydroxymethyl) aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.

Efudex Cream contains 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

Actions: There is evidence that the metabolism of fluorouracil in the anabolic pathway blocks the methylation reaction of deoxyuridylic acid to thymidylic acid. In this fashion fluorouracil interferes with the synthesis of deoxyribonucleic acid (DNA) and to a lesser extent inhibits the formation of ribonucleic acid (RNA). Since DNA and RNA are essential for cell division and growth, the effect of fluorouracil may be to create a thymine deficiency which provokes unbalanced growth and death of the cell. The effects of DNA and RNA deprivation are most marked on those cells which grow more rapidly and which take up fluorouracil at a more rapid pace. The catabolic metabolism of fluorouracil results in degradative products (*e.g.*, CO_2, urea, α-fluoro-β-alanine) which are inactive.

Studies in man with topical application of ^{14}C-labeled Efudex demonstrated insignificant absorption as measured by ^{14}C content of plasma, urine and respiratory CO_2.

Indications: Efudex is recommended for the topical treatment of multiple actinic or solar keratoses.

Contraindications: Efudex is contraindicated in patients with known hypersensitivity to any of its components.

Warnings: If an occlusive dressing is used, there may be an increase in the incidence of inflammatory reactions in the adjacent normal skin.

Prolonged exposure to ultraviolet rays should be avoided while under treatment with Efudex because the intensity of the reaction may be increased.

Usage in Pregnancy: Safety for use in pregnancy has not been established.

Precautions: If Efudex is applied with the fingers, the hands should be washed immediately afterward. Efudex should be applied with care near the eyes, nose and mouth. To rule out the presence of a frank neoplasm, a biopsy should be made of those areas failing to respond to treatment or recurring after treatment.

Adverse Reactions: The most frequently encountered local reactions were pain, pruritus, hyperpigmentation and burning the site of application. Other local reactions included dermati scarring, soreness and tenderness.

Also reported were insomnia, stomatitis, suppuration, scali swelling, irritability, medicinal taste, photosensitivity and lacrimation.

Laboratory abnormalities reported were leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.

Dosage and Administration: Efudex should be applied twice d with a nonmetal applicator or suitable glove in an amount of solution or cream sufficient to cover the lesion. When Efudex applied to a lesion, a response occurs with the following sequ erythema, usually followed by vesiculation, erosion, ulceratic necrosis and epithelization. The lower frequency and intensit activity in adjacent normal skin indicate a selective cytotoxic property. Medication should be continued until the inflammat reaction reaches the erosion, necrosis and ulceration stage, a which time use of the drug should be terminated. The usual duration of therapy is from 2 to 4 weeks. Complete healing of lesion may not be evident for 1 to 2 months following cessatio Efudex therapy.

How Supplied: Efudex Solution, 10-ml drop dispensers—conta 2% or 5% fluorouracil on a weight/weight basis, compounde with propylene glycol, tris(hydroxymethyl)aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.

Efudex Cream, 25-Gm tubes—containing 5% fluorouracil i vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (met and propyl).

Clinical Studies: The effectiveness of the three preparations determined by complete involution of solar keratoses was: 2% Solution, 77% of 282 lesions; 5% Solution, 88% of 202 lesions; and 5% Cream, 85% of 189 lesions. In those lesions w complete involution followed treatment, the rate of possible recurrences observed clinically at periods up to 12 months or was: 2% Solution, 4.6% of 218 lesions; 5% Solution, 1.7% of lesions; and 5% Cream, 5.6% of 160 lesions. Because of the to potential of fluorouracil, some physicians preferred to use the solution when large areas were to be treated. Approximately of the lesions required treatment for two weeks or less; approximately 78% required four weeks or less for adequat treatment.

MEDICAL NEWS

Two research grants totaling almost $15,000 were awarded to two Maryland physicians by the National Tuberculosis and Respiratory Disease Association.

George Comstock, MD, of Hagerstown, received a grant of $4,837 for his continuing work in determining the relationship of respiratory diseases to the amount of air pollution in urban cities.

The other two-year grant of $10,088 was awarded to **Norman E. Morrison, PhD,** microbiologist and Associate Professor of Pathobiology at The Johns Hopkins University School of Hygiene and Public Health. Dr. Morrison's research will seek new and more efficient drugs to treat respiratory infections, particularly tuberculosis.

* * *

Six new physicians will help ease Washington County's physician shortage. **Henry L. Rogdon, MD, John W. Sloan, MD, Joseph C. Eshleman, MD, Eldon Leon Hawbaker, MD, John H. Hornbaker, Jr., MD,** and **John Wesley Wilson, MD,** will serve in the Emergency Coverage System of the Washington County Hospital.

* * *

William H. Danforth, MD, former Vice-Chancellor for Medical Affairs of Washington University in St. Louis, Missouri, has been appointed to serve on the National Advisory Heart and Lung Council of the National Heart and Lung Institute in Bethesda. Robert Q. Marston, National Institutes of Health Director, recently made the announcement.

* * *

Samuel L. Fox, MD, a Baltimore ophthalmologist, recently compared the treatment results of the topical use of a new antibiotic with that of a combination preparation used for years, in an article in the September issue of the *Southern Medical Journal.*

The article was entitled "Some Aspects in the Diagnosis and Management of External Infections of the Eye: Experiences with a New Antibiotic, Gentamicin."

* * *

Victor A. McKusick, MD, Chief of the Division of Medical Genetics at The Johns Hopkins University School of Medicine, was recently featured as a guest lecturer at a five-day postgraduate course sponsored by The American College of Physicians.

The course, "Basic Mechanisms in Internal Medicine", was given at the Medical College of Virginia.

* * *

Russell A. Nelson, MD, of Baltimore, **Stephen K. Padussis, MD,** of Lutherville, and **Austin B. Rohrbaugh, MD,** of Chevy Chase, were recently appointed by Governor Mandel to the state's Comprehensive Health Planning Council.

* * *

Alvin G. Lazen, MD, Assistant Professor of Physiological Chemistry, has been appointed Assistant Dean of The Johns Hopkins University School of Medicine.

As Assistant Dean, Dr. Lazen will spend part of his time reviewing and coordinating the finances of programs in the school's basic science departments that are paid for by sources outside the university.

* * *

John Neff, MD, has been appointed Assistant Dean of the Medical Faculty at The Johns Hopkins University School of Medicine.

Dr. Neff is an Assistant Professor of Pediatrics, who for the past year has been serving as student advisor. He graduated from Harvard Medical School and served his internship and residency at The Johns Hopkins Hospital.

Dr. Neff

* * *

Edwin L. Crosby, MD, Executive Vice-President and Director of the American Hospital Association, has been named the 1970 recipient of the AHA's Justin Ford Kimball Award in recognition of his outstanding encouragement of the concept of prepaid voluntary health care plans.

For more than three decades, Dr. Crosby has exerted strong influence on the development, integrity, and direction of Blue

Cross Plans. He has always emphasized the coalition of hospitals and Blue Cross Plans as a common service goal to the community.

Dr. Crosby received his masters and doctorate degrees in public health from The Johns Hopkins University.

* * *

Sister Alberta, DC, President of the St. Agnes Hospital Board of Trustees, announced the signing of a contract which grants exclusive rights to a group of **Emergency Room Physicians,** a Maryland professional corporation.

This group now has the right to provide the necessary licensed physicians required to staff the hospital's emergency room service. In doing so, the hospital has franchised the emergency room facilities to the corporation.

* * *

The National Clearinghouse for Drug Abuse Information has announced a 24-hour telephone service to answer requests for information about drug abuse.

The newly-created clearinghouse is a branch of the National Institute of Mental Health, Department of Health, Education, and Welfare. It serves as the federal focal point for drug abuse information.

The number to call for drug abuse information around the clock is 301-496-7171.

Bertram S. Brown, MD, NIMH Director, describes the clearinghouse as a "one stop store of information which must be put in the hands of parents, students, teachers, law enforcement officers, community leaders and all citizens concerned with the problem".

* * *

Joseph H. Miller, MD, has been appointed full-time Chief of the Section of Pulmonary Medicine at St. Agnes Hospital.

Recently, Dr. Miller completed a two-year Fellowship in Respiratory Diseases at The Johns Hopkins Hospital. He is a member of the American and Maryland Thoracic Societies, the Baltimore City Medical Society, and the Medical and Chirurgical Faculty of Maryland.

* * *

Every year in the United States alone, thousands of infants die suddenly and for no apparent medical reason. Only very recently has this sudden infant death syndrome, commonly known as **crib death,** become recognized as a real disease, not a vague, mysterious killer.

Bringing together reports from the leading researchers throughout the world who are dealing with this phenomenon, *Sudden Infant Death Syndrome,* edited by Drs. Bergman, Beckwith, and Ray, represents a major contribution to medical literature.

Russell S. Fisher, MD, Chief Medical Examiner of Maryland and a past president of the Medical and Chirurgical Faculty of Maryland, was one of the chief contributors to the book.

* * *

Robert Sandler, MD, was recently elected President of the Maryland Ophthalmological Society. **Stan L. Coleman, MD,** was elected Vice-President while **Gregory J. Sophocleus, MD,** was elected Secretary-Treasurer.

* * *

Robert Ralph Hylton, MD, of Camp Springs, was recently elected a Fellow of the American College of Anesthesiologists.

* * *

Persons planning to travel to South and Southeast Asia, the Middle East, North Africa, and Russia, should receive cholera immunization, according to **Howard Garber, MD,** Chief of the Division of Communicable Diseases, Maryland State Department of Health. He reported that a number of nations are now instituting quarantine procedures.

* * *

Neil O'Donnell, CP, former Chaplain and Chairman of the Department of Religion at St. Agnes Hospital, was recently awarded honorary residency at the hospital for eternity by the residents there.

The hospital's administrator, **Sister Alberta,** was also appointed Chief Honorary Resident for eternity.

* * *

Five Baltimore hospitals, seeking to improve efficiency and reduce operating costs, have formed a nonprofit corporation for joint purchasing of services and supplies.

The hospitals—Church Home, Good Samaritan, Greater Baltimore Medical Center, The Johns Hopkins, and Union Memorial —have made the venture unique by formalizing their agreement in a contract.

The new corporation is called **The Hospital Service and Supply Center, Inc.**

* * *

Doris M. Armstrong has been appointed Director of Nursing at The Johns Hopkins Hospital. Miss Armstrong had formerly served as Director of Operative and Acute Services there.

Miss Armstrong now heads all of the nursing personnel in the hospital and is responsible for the nursing care afforded to all of the patients.

The fact that people of all ages need protein everyday is emphasized in **"Protein",** a lively new six-minute color film which is available for loan from the Maryland State Department of Health and Mental Hygiene.

The film may be borrowed

without charge from the Film Services, Maryland State Department of Health and Mental Hygiene, 301 West Preston Street, Baltimore. (Phone 383-3010, extension 8516.)

* * *

The President of The Johns Hopkins Hospital of Baltimore, **Russell A. Nelson, MD,** has been elected to the Board of Directors of Control Data Corporation.

* * *

Robert F. Wilson, Regional Vice-President of Hospital Food Management, has returned to The Johns Hopkins Hospital as Administrative Vice-President and Administrator.

Mr. Wilson had served on The Johns Hopkins staff from 1954 until August 1969. During the past year, he directed the management of dietary services for 34 hospitals in a nine-state Midwestern area.

* * *

Physicians again are being invited to submit original papers on headache or other pain in competition for the sixth annual **Harold G. Wolff Award** of the American Association for the Study of Headache.

The award, which carries with it a $1,000 honorarium underwritten by Sandoz Pharmaceuticals, may be divided among two or more researchers. It will be presented at the AASH's annual meeting in Copenhagen, Denmark, May 17-18, 1971.

Papers must be submitted by December 15, 1970, according to Perry S. MacNeal, MD, president of the association. Entries should be sent in duplicate to Donald J. Dalessio, MD, editor of the society's journal, *Headache,* 8878 Nottingham, La Jolla, California 92037.

* * *

John Sargeant, Executive Director of the Medical and Chirurgical Faculty of Maryland, spoke on the state's successful efforts to correct abuses of the medicare program at the Third National Congress on Medical Ethics held recently in Chicago.

* * *

Governor Marvin Mandel announced recently that Maryland has contracted for one of the **nation's most modern air pollution monitoring systems** as part of his continuing program to curtail air pollution and improve air quality in the state.

The Maryland system, called **"Airmon",** will provide for continuous telemetered air quality data from a network of eight sampling stations strategically located around the state.

* * *

Eastern Shore State Hospital, of the Maryland Department of Mental Hygiene, has been fully accredited by the Joint Commission of Accreditation for the maximum two years, according to an announcement by James E. Carson, MD, Commissioner of Mental Hygiene.

Neil Solomon, MD, PhD, Secretary of Health and Mental Hygiene, praised **Harold M. English, MD,** Superintendent of Eastern Shore State Hospital by commenting that, "this action by the commission certainly reflects great credit on your leadership and upon the devotion and efficiency of your staff."

* * *

James G. Zimmerly, MD, of Ellicott City, delivered a talk on a new meningitis vaccine at the American Medical Association's recent annual convention in Chicago.

Dr. Zimmerly and his colleagues first reported the results of their extensive field trials with the vaccine in the February issue of the *New England Journal of Medicine.*

* * *

Officers and board members of South Baltimore General Hospital recently issued a statement for strong support of appropriate hospital legislation needed at this time. The statement maintains that the approaches represented by U.S. Senate Bill 547 and House Bill 1082 are inadequate means to judge hospitals by or to set policy from.

* * *

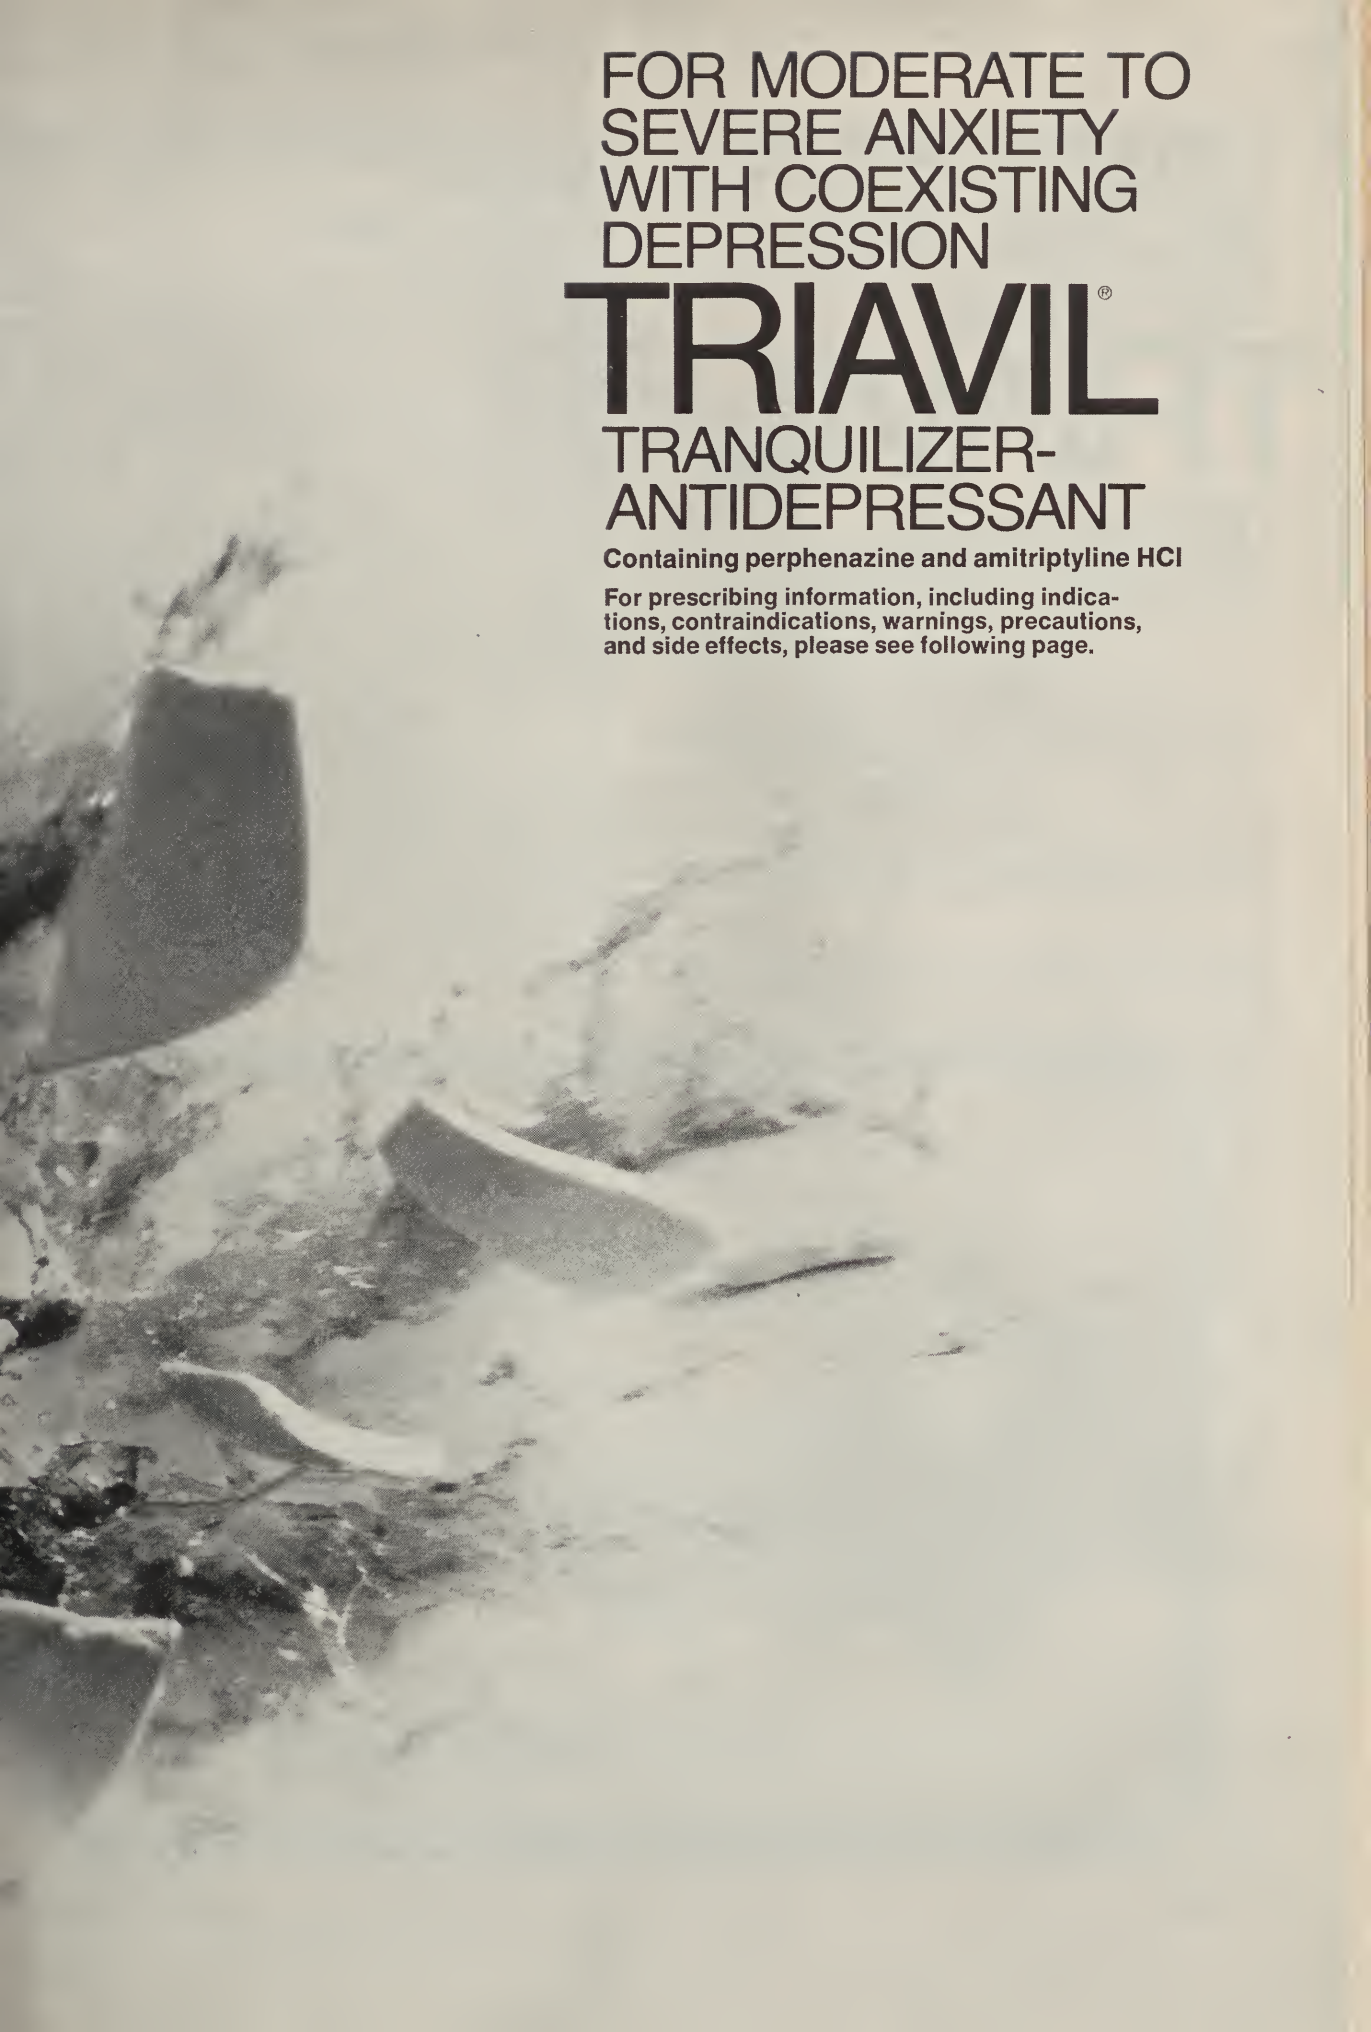
Noting that it is probable that **changes in Medicare** will be enacted during this session of Congress, the Social Security Administration has instructed carriers to continue temporarily the existing levels for reimbursement of physicians and other suppliers of medical services under Part B of Medicare, which was due to be changed July 1.

Based on instructions issued in April, carriers had begun the operations needed to convert charge data accumulated in 1969 into new customary and prevailing charges that would be applicable beginning July 1.

* * *

Physicians and dentists participating in the **Maryland Medical Assistance Program** have been urged to prescribe drugs by their generic names so that pharmacists may dispense a quality product reasonably priced.

The request was made in a joint statement issued by the Medical and Chirurgical Faculty of Maryland, the Maryland Pharmaceutical Association, and the Maryland State Department of Mental Hygiene.



* * *

James L. Bolen, MD, has been appointed a Scientific Grants Administrator in the Special Programs Branch of the National Heart and Lung Institute's Extramural Research Program. Dr. Bolen will be responsible for advising research grant applicants and recipients and for administering NHLI grants for the support of research in various fields.

BREAKUP—symbol of the impact of emotional stress
But when the stress exceeds transient rage or depression—and settles into a chronic mixed anxiety depression state—combined tranquilizer-antidepressant therapy could be indicated.

FOR MODERATE TO SEVERE ANXIETY WITH COEXISTING DEPRESSION

TRIAVIL®

TRANQUILIZER-ANTIDEPRESSANT

Containing perphenazine and amitriptyline HCl

For prescribing information, including indications, contraindications, warnings, precautions, and side effects, please see following page.

FOR MODERATE TO SEVERE ANXIETY WITH COEXISTING DEPRESSION

TRIAVIL®

TRANQUILIZER-ANTIDEPRESSANT

Containing perphenazine and amitriptyline HCl

TRIAVIL®2-10: Each tablet contains 2 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.

TRIAVIL®2-25: Each tablet contains 2 mg. of perphenazine and 25 mg. of amitriptyline hydrochloride.

TRIAVIL®4-10: Each tablet contains 4 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.

TRIAVIL®4-25: Each tablet contains 4 mg. of perphenazine and 25 mg. of amitriptyline hydrochloride.

INDICATIONS: Patients with moderate to severe anxiety and/or agitation and depressed mood; patients with depression in whom anxiety and/or agitation are severe; patients with depression and anxiety in association with chronic physical disease; schizophrenics with associated depressive symptoms.

CONTRAINDICATIONS: Central nervous system depression from drugs (barbiturates, alcohol, narcotics, analgesics, antihistamines); bone marrow depression; pregnancy; and in patients with known hypersensitivity to phenothiazines or amitriptyline. Do not give in combination with MAOI drugs because of possible potentiation that may even cause death. Allow at least two weeks between therapies. In such patients therapy with TRIAVIL should be initiated cautiously, with gradual increase in the dosage required to obtain a satisfactory response. Do not give concomitantly with guanethidine or similarly acting compounds since it may block the antihypertensive effect.

WARNINGS: Patients should be warned against driving a car or operating machinery or apparatus requiring alert attention, and that response to alcohol may be increased.

PRECAUTIONS: Suicide is always a possibility in mental depression and may remain until significant remission occurs. Supervise patients closely in case they may require hospitalization or concomitant electroshock therapy. Untoward reactions have been reported after the combined use of antidepressant agents having various modes of activity. Accordingly, consider possibility of potentiation in combined use of antidepressants. Use with caution in patients with glaucoma and those with problems of urinary retention. Perphenazine can lower the convulsive threshold in susceptible individuals. It should be given with caution to patients with convulsive disorders. Dosage of the anticonvulsive agent may have to be increased. Not recommended for use in children. Mania or hypomania may be precipitated in manic-depressives (perphenazine in TRIAVIL seems to reduce likelihood of this effect). If hypotension develops, epinephrine should not be employed, as its action is blocked and partially reversed by perphenazine. Caution patients about errors of judgment due to change in mood.

ADVERSE REACTIONS: Similar to those reported with either constituent alone.

Perphenazine: Should not be used indiscriminately. Use caution in patients who have previously exhibited severe reactions to other phenothiazines. Likelihood of untoward actions greater with high doses. Closely supervise with any dosage. Side effects may be any of those reported with phenothiazine drugs: extrapyramidal symptoms (opisthotonos, oculogyric crisis, hyperreflexia, dystonia, akathisia, dyskinesia, parkinsonism) usually controlled by the concomitant use of effective antiparkinsonian drugs and/or by reduction in dosage, but sometimes persist after discontinuation of the phenothiazine; skin disorders (photosensitivity, itching, erythema, urticaria, eczema, up to exfoliative dermatitis); other allergic reactions (asthma, laryngeal edema, angioneurotic edema, anaphylactoid reactions); peripheral edema; reversed epinephrine effect, hyperglycemia; endocrine disturbances (lactation, galactorrhea, disturbances of menstrual cycle); altered cerebrospinal fluid proteins; paradoxical excitement; EKG abnormalities (quinidine-like effect); reactivation of psychotic processes; catatonic-like states; autonomic reactions, such as dryness of the mouth, headache, nausea, vomiting, constipation, obstipation, urinary frequency, blurred vision, nasal congestion, and a change in the pulse rate; hypnotic effects; pigmentary retinopathy; corneal and lenticular pigmentation; occasional lassitude; muscle weakness; mild insomnia. Other adverse reactions reported with various phenothiazine compounds, but not with perphenazine, include blood dyscrasias (pancytopenia, thrombocytopenic purpura, leukopenia, agranulocytosis, eosinophilia); liver damage (jaundice, biliary stasis); grand mal convulsions; cerebral edema; polyphagia; photophobia; skin pigmentation; and failure of ejaculation. Significant unexplained rise in body temperature may suggest intolerance to perphenazine, in which case discontinue. Antiemetic effect may obscure signs of toxicity due to overdosage of other drugs or make diagnosis of other disorders such as brain tumors or intestinal obstruction difficult. May potentiate the action of central nervous system depressants (opiates, analgesics, antihistamines, barbiturates, alcohol) and atropine. In concurrent therapy with any of these, TRIAVIL should be given in reduced dosage. May also potentiate the action of heat and phosphorous insecticides.

Amitriptyline: Careful observation of all patients recommended. Side effects include drowsiness (may occur within the first few days of therapy); dizziness; nausea; excitement; hypertension; fainting; fine tremor; jitteriness; weakness; headache; heartburn; anorexia; increased perspiration; incoordination; impotence; increased appetite and weight gain; allergic-type reactions manifested by skin rash, swelling of face and tongue, itching; numbness and tingling of limbs, including peripheral neuropathy; activation of latent schizophrenia (however, the perphenazine content may prevent this reaction in some cases); epileptiform seizures; temporary confusion, disturbed concentration, or transient visual hallucinations on high doses; evidence of anticholinergic activity, such as tachycardia, dryness of mouth, stomatitis, blurring of vision, reversible dilatation of the urinary tract, urinary retention, constipation, paralytic ileus; agranulocytosis; jaundice. Elderly patients and adolescents can often be managed on lower dosage levels.

For more detailed information, consult your MSD Representative or see the package circular. Merck Sharp & Dohme Division of Merck & Co., Inc., West Point, Pa. 19486.

Pr

THE MONTH IN WASHINGTON

The Nixon Administration is drafting legislation that would eliminate the reason for physicians forming professional corporations for federal income tax advantages.

The legislation would remove the tax discrimination against self-employed physicians and other professionals in the tax treatment of retirement savings.

K. Martin Worthy, chief counsel of the Internal Revenue Service, said that the legislation probably will be submitted to Congress next year as an administration measure. He said that the administration intends to "remove the present discrimination between tax treatment of qualified plans for employees and qualified plans adopted by self-employed persons."

The IRS official said that it was unfortunate that disparate tax treatment of corporate employees and professionals has led to the adoption of state laws permitting the formation of professional corporations.

"The potential, if not actual, erosion of the traditional stringent professional standards and liabilities on the part of those who form such organizations is, in my opinion, a highly undesirable by-product of this problem and its resolution to date," he told a meeting of lawyers. "The intervention of a legal entity between the doctor, lawyer, or accountant and his client would not appear to serve any social or public purposes."

Worthy warned that recognition of a professional organization as a corporation for tax purposes did not necessarily mean that the organization and its employees would have a clear track as far as securing the tax benefits which are desired.

Worthy said that an important consideration to be weighed by the professional person is that the new tax act provides for a 50% maximum tax rate, after a transition period, upon "earned income", which includes earnings from personal services.

"In view of this new tax ceiling, it is questionable whether a professional person would find it as important as it was previously to achieve the tax deferral available as an employee covered by a qualified pension or profit sharing plan," he said.

* * *

The Board of Medicine of the National Academy of Sciences urged wide use of three types of physician's assistants as the quickest way to relieve the national shortage of physicians.

In a special report, the board called for the cooperation of the American Medical Association, the Association of American Medical Colleges, and the government in developing physician's assistants programs.

The AMA has been advocating use of physician's assistants for some time. Walter C. Bornemeier, MD, President of the AMA, recently said:

"We of the AMA believe the shortage (of physicians) can be dramatically relieved if the physician divests himself of functions which can be performed by assistants or associates. That relief would be provided, not in ten years, but as fast as assistants could be trained—no major legislation, no huge appropriations of money are required. We are certain the plan will result in better care for more people at a lower unit cost. Much of the training given to the assistants is, and would be in future programs, on-the-job instruction in the doctor's office.

"There is nothing revolutionary about this plan. Until 50 years ago, American doctors trained by working in the offices of established physicians. And even with the rise of university-affiliated medical colleges, we doctors continued to train the bulk of our nonprofessional nurses and office technicians."

The NAS board said that physician's assistants could "extend the arms, legs and brains of the physician" by performing tasks that do not require the unique talents of the physician.

The three types of assistants recommended by the board were:

1) Physician's associate (the most highly-trained type) —would be qualified to do work that involves some independent medical judgment. Under the physician's supervision, he could, in some cases, make a diagnosis and perform therapy, with the range of his responsibilities increasing as he develops new skills on the job.

2) Specialized assistant— would be highly skilled in one type of clinical specialty or procedure within a specialty (such as the operation of a renal dialysis unit). He would

receive most of his training from a physician specialist.

3) Nonspecialized assistant —would be to medicine what the practical nurse is to nursing. He could receive much of his training on the job.

As the AMA has been doing, the board cautioned against the premature enactment of licensing laws that would establish rigid job qualifications before the full potential usefulness of the assistants had been determined. The board report recommended a system of registration that would permit physicians to employ assistants who had completed an approved program or otherwise established their qualifications.

Possession of a high school diploma should be an adequate prerequisite for training to become physician's assistants, according to the NAS Board. It suggested varying amounts of education, clinical experience, and on-the-job training for the three types of assistants. For physician's associates, it recommended the equivalent of two years of professional-level classroom and clinical work. Instruction should cover the basic sciences underlying medical practice, and clinical training should be "of essentially the same type and degree as that given medical students". Medical corpsmen, about 30,000 of whom are discharged from the military services each year, and other medical workers who enter the training program should be allowed credit for the clinical knowledge they already have acquired.

* * *

The American Medical Association opposed establishment of a national formulary that could restrict the prescribing practices of physicians with respect to federally-supported medical programs.

Of a letter from Sen. Russell B. Long (D., La.), chairman of the Senate Finance Committee, which was considering such legislation, Ernest B. Howard, MD, executive vice-president of the AMA, said:

"The American Medical Association, representing approximately 180,000 active private practitioners of medicine in America, is opposed to a proposal that would interfere with the professional judgment and responsibilities of physicians. The proposed amendment, which would give a Federal Formulary Committee the authority to *exclude* from the Formulary (and therefore from payment) any drug which it considers unnecessary is, in our opinion, just such an infringement upon the professional judgment of practicing physicians.

"The amendment would provide the Formulary Committee with authority to publish prescribing information about each drug listed. Adequate prescribing information to assist physicians in selecting the most rational course of therapy is available through a variety of acceptable sources. The proposed additional information is not only unnecessary but undesirable since physicians would be unable to deviate from that standard regardless of a particular patient's circumstances without facing the risk of malpractice liability.

"Further, the amendment would require that a physician who desires to prescribe the product of a particular manufacturer with which he had experience and confidence could do so only by writing in his own handwriting the established name of the drug again and the name of the preferred manufacturer. We disagree with this practice limiting the authority of the physician to prescribe the drug of his choice. Our governing body, the AMA House of Delegates, has stated and reaffirmed on many occasions that physicians should be free to use either the generic (established) or brand name in writing prescriptions.

"In addition, the proposed amendment would have the Formulary Committee institute inspections, sample examinations, and scientific review of drug products to be listed by the name of the supplier or the brand name. This task of the committee seems to be beyond its capability, particularly since it is constituted only on a part-time basis . . .

"We have said many times that we want our patients to receive high-quality drugs at the lowest possible cost. We continue in this position, more strongly than ever. But, we firmly believe that the creation of a national formulary would not bring about a more economical provision of drugs under programs established within the Department of Health, Education, and Welfare, nor would it enhance the quality of these drugs."

* * *

The American Medical Association supported a Senate-approved bill that would expand federal family planning services and population research activities.

In a statement submitted to the House Subcommittee on Public Health and Welfare, the AMA said it believes the establishment of an Office of Population Affairs under a deputy assistant secretary in the Department of Health, Education, and Welfare is highly desirable. The office would make formula or special project grants relating to population and family planning; administer population and family planning research; act as a clearinghouse on domestic and international population family planning programs; provide liaison with other federal agencies; and support training for manpower in these programs.

The bill (S. 2108) also would authorize special projects for family planning services, formula grants for family planning, training and research grants, and grants for the construction and operation of population research centers.

The AMA said that there is an urgent need for a greatly expanded program of population research, as authorized by the legislation.

"If the worldwide population increase is to be controlled," the AMA said, "it will require more scientific knowledge of human behavior. We need more research on reproductive physiology, more demographic research, and more attitudinal and motivational research."

The AMA listed a number of obstacles to be overcome if a national program for population control is to be effective: education, religion, legal, and economic considerations.

"The most formidable of these is lack of education," the AMA statement said. "Population control is only attainable when people first understand the nature of their own bodies."

Meantime, the Defense Department disclosed that a series of rulings this year had made it mandatory that U.S. military base hospitals throughout the world perform abortions and surgical sterilizations for armed forces personnel and their dependents regardless of state and local laws.

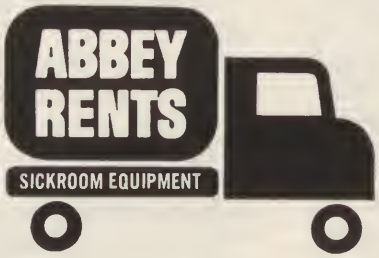
Dr. Louis M. Rousselot, Assistant Secretary of Defense for Health and Environment, issued the rulings to clarify a policy that had been effective since 1966 but which some bases had not been following.

* * *

Five Republican senators introduced legislation that would establish a four-year federal program of family physician scholarships and fellowships to medical students and graduates who agree to practice in physician-shortage areas or to serve migratory agricultural workers.

For the first year, about 500 scholarships not to exceed $5,000, and 200 fellowships would be offered at a cost of $4.5 billion. The program would be expanded each year until, by the fourth year, 1,000 scholarships and 500 fellowships would be authorized for students and graduates agreeing to practice in isolated rural areas, migrant areas, city ghettos, and Indian reservations with a shortage of physicians.

For each year of a scholarship, one year of service would be required. No additional service would be required under the fellowship part of the program.



Sen. George W. Murphy (R., Calif.) was chief sponsor of the legislation (S. 4208). Cosponsors were Sens. Peter H. Dominick (R., Colo.), Jacob K. Javits (R., N.Y.), Winston L. Prouty (R., Vt.), and William B. Saxbe (R., Ohio).

in cardiac edema

Dyazide®

Trademark

Each capsule contains 50 mg. of Dyrenium® (brand of triamterene) and 25 mg. of hydrochlorothiazide.

gets the water out

spares the potassium

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.

Indications: Edema associated with congestive heart failure, cirrhosis of the liver, the nephrotic syndrome, late pregnancy; also steroid-induced and idiopathic edema, and edema resistant to other diuretic therapy. 'Dyazide' is also indicated in the treatment of mild to moderate hypertension.

Contraindications: Pre-existing elevated serum potassium. Hypersensitivity to either component. Continued use in progressive renal or hepatic dysfunction or developing hyperkalemia.

Warnings: **Do not use dietary potassium supplements or potassium salts unless hypokalemia develops or dietary potassium intake is markedly impaired.** Enteric-coated potassium salts may cause small bowel stenosis with or without ulceration. Hyperkalemia (>5.4 mEq/L) has been reported in 4% of patients under 60 years, in 12% of patients over 60 years, and in less than 8% of patients overall. Rarely, cases have been associated with cardiac irregularities. Accordingly, **check serum potassium during therapy, particularly in patients with suspected or confirmed renal insufficiency (e.g., certain elderly or diabetics). If hyperkalemia develops, substitute a thiazide alone. If spironolactone is used concomitantly with 'Dyazide', check serum potassium frequently**—they can both cause potassium retention and sometimes hyperkalemia. Two deaths have been reported in patients on such combined therapy (in one, recommended dosage was exceeded; in the other, serum electrolytes were not properly monitored). Observe regularly for possible blood dyscrasias, liver damage or other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving Dyrenium (triamterene, SK&F). Rarely, leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with the thiazides. Watch for signs of impending coma in acutely ill cirrhotics. Thiazides are reported to cross the placental barrier and appear in breast milk. This may result in fetal or neonatal hyperbilirubinemia, thrombocytopenia, altered carbohydrate metabolism and possibly other adverse reactions that have occurred in the adult. When used during pregnancy or in women who might bear children, weigh potential benefits against possible hazards to fetus.

Precautions: Do periodic serum electrolyte and BUN determinations. Do periodic hematologic studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in postsympathectomy patients. The following may occur: hyperuricemia and gout, reversible nitrogen retention, decreasing alkali reserve with possible metabolic acidosis, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), digitalis intoxication (in hypokalemia). Use cautiously in surgical patients. Concomitant use with antihypertensive agents may result in an additive hypotensive effect.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis; rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting (may indicate electrolyte imbalance), diarrhea, constipation, other gastrointestinal disturbances. Rarely, necrotizing vasculitis, paresthesias, icterus, pancreatitis, and xanthopsia have occurred with thiazides alone.

Supplied: Bottles of 100 capsules.

Gone with the wind

The gas/acid group of disorders

The two most common complaints referable to the upper gastrointestinal tract for which patients seek medical relief are hyperacidity and 'gas.' The two often occur together."*

Frees captured gas...neutralizes free acid

SILAIN-GEL Tablets and Liquid are separate formulas designed to provide equivalent dual-action symptomatic relief. Both dosage forms contain simethicone which effectively frees trapped gas, enabling the patient to eliminate it. Magnesium hydroxide in both assures a rapid rise in pH for prompt relief of hyperacidity. The special co-dried aluminum hydroxide/magnesium carbonate gel in the tablets assures the same rapid and uniform reaction rate as the liquid. Thus, both medications achieve prompt and prolonged neutralization of free acid *plus* prompt relief from the pain and pressure of trapped gas.

Always in good taste

The pleasant, distinctive flavor of SILAIN-GEL, as well as its non-constipating feature, make it a therapy your patients can live with—in comfort and without complaint.

Select the form of SILAIN-GEL you want to provide symptomatic relief in: gastric ulcer • duodenal ulcer • heartburn • gastric hyperacidity • gastritis • dyspepsia

when the patient prefers the convenience of a tablet, select
Silain-Gel® Tablets:

when the patient prefers a liquid, select
Silain-Gel® Liquid

Also available for the patient who needs an antifrothicant/antiflatulent agent only: **Silain®** (simethicone) Tablets

*Hanger, A.: Med. Times 94:150 (Feb.) 1966.

Announcing the "Antgasid"

Silain-Gel®

Tablets: simethicone plus aluminum hydroxide/magnesium carbonate co-dried gel and magnesium hydroxide
Liquid: simethicone plus aluminum hydroxide and magnesium hydroxide

One dose does both: frees captured gas...neutralizes free acid

Drip stopped, Congestion cleared

For upper respiratory allergies and infections, up to 12 hours clear breathing on one tablet. Dimetapp Extentabs® does an outstanding job of helping to clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely.

INDICATIONS: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, rhinitis, conjunctivitis, and otitis. CONTRAINDICATIONS: Hypersensitivity to antihistamines. Not recommended for use during pregnancy. PRECAUTIONS: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension. SIDE EFFECTS: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered. DOSAGE: 1 Extentab morning and evening. SUPPLIED: Bottles of 100 and 500.

THE HISTORY OF CARDIAC SURGERY 1896-1955, Stephen L. Johnson, MD; The Johns Hopkins Press, Baltimore, Maryland, 1970.

Cardiac surgery began in 1896 with Ludwig Rehn's first successful suture of a human heart. This book traces the history of this field of surgery up to 1955. Even though open heart surgery is, of course, the most dramatic procedure mentioned in this publication, other techniques and instruments are handily described.

What makes this book intensely interesting is the first person contact that Doctor Johnson had with many of the pioneers in this field. Details of what actually happened were obtained from such persons as Doctors Harkin, Bailey, Taussing, Hufnagel, Gibbon, Lillehi, and others.

This book is not written in the stilted, medical prose that so often characterizes medical publications. It is worthwhile reading not only for its scientific history and facts, but because it is almost as good as a novel.

HANDBOOK OF LEGAL MEDICINE, Alan R. Moritz and R. Crawford Morris; The C. V. Mosby Company, St. Louis, Missouri, 1970.

This book serves as a concise reference for both law and medical students. It provides specific answers to specific medicolegal questions. Now in its third edition, this publication is divided into three main sections: Scientific Medicolegal Investigation; Physician and Patient—Physician and the Law; and a Glossary of Terms.

While it is a condensed volume, it is thorough. It offers fundamental, practical, and timely information to the reader.

His makeup is unique by tradition.

His ulcer treatment is unique by tradition, too.

In the world of entertainment, a clown's makeup remains the exclusive property of its originator. Time has established that tradition. In the treatment of ulcers and other gastrointestinal complaints, time has established Pro-Banthine as a tradition too.

Few drugs can boast a longer successful run. Introduced 17 years ago, this drug is a veteran gastrointestinal performer.

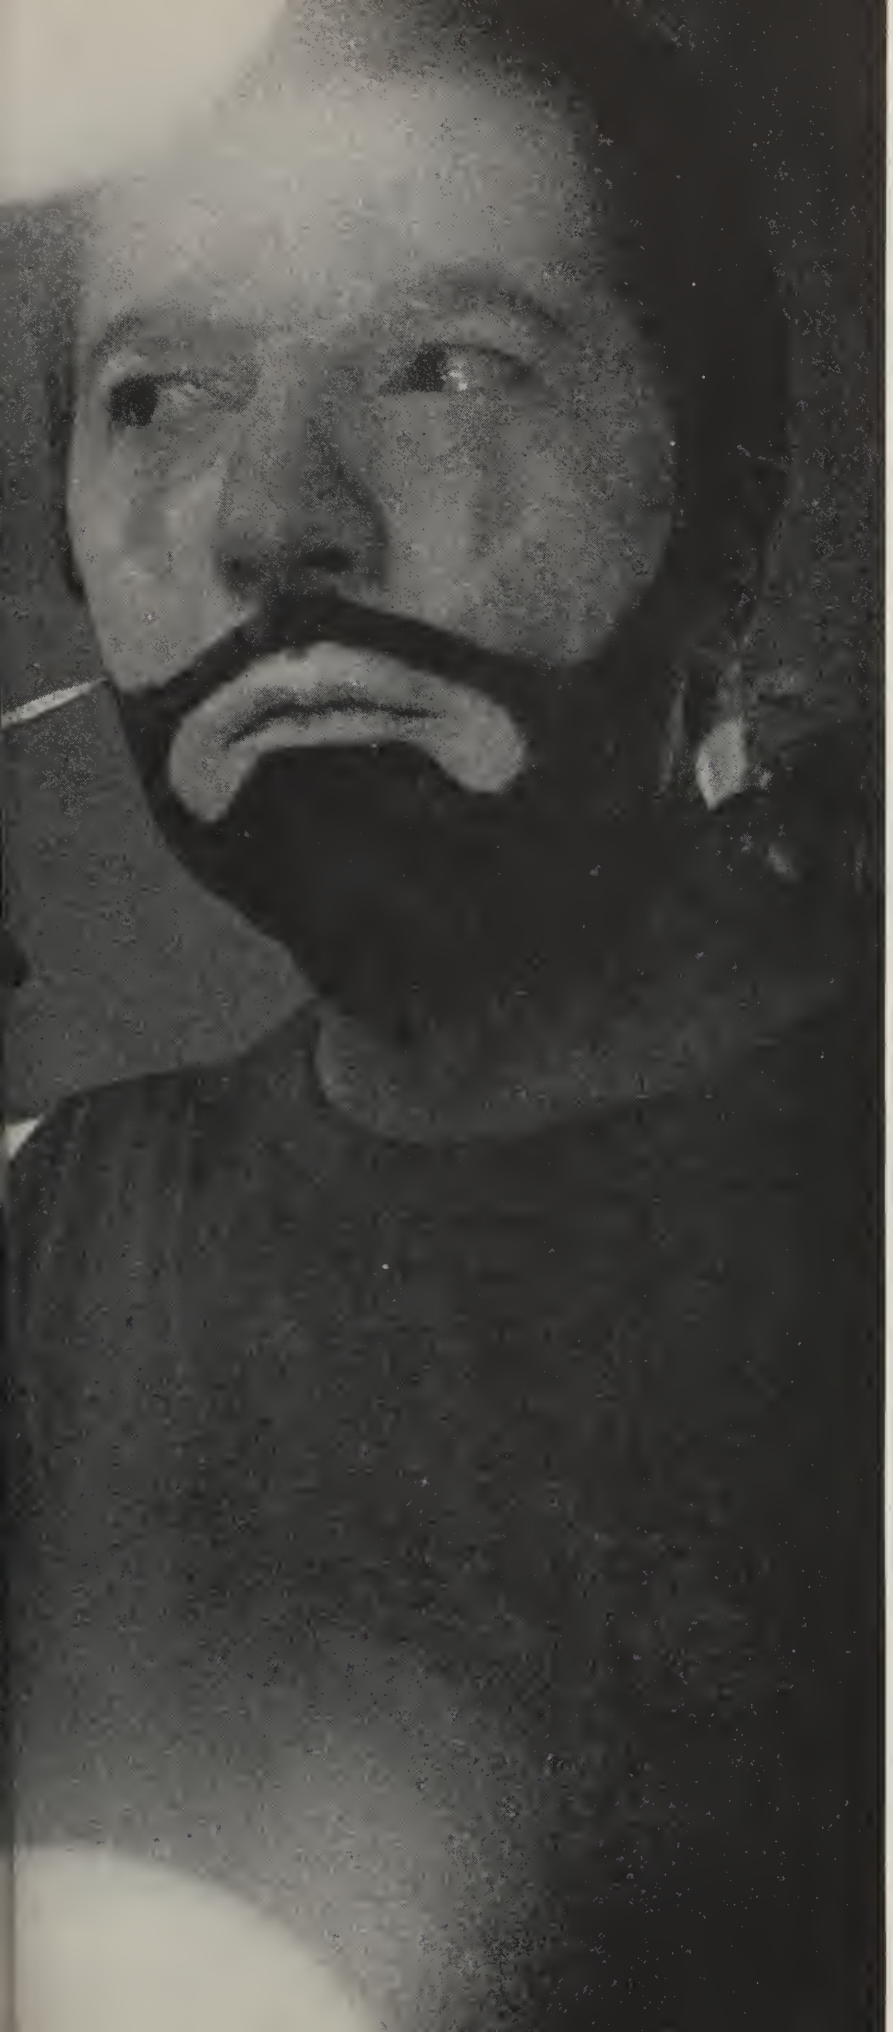
Pro-Banthine stars in the treatment of peptic ulcer, functional gastrointestinal disturbances, ulcerative colitis, hypertrophic gastritis, pylorospasm, acute and chronic pancreatitis, diverticulitis, biliary dyskinesia, hyperhidrosis, ileostomies, and colonic, ureteral or urinary bladder spasm. Its fame as an anticholinergic is worldwide.

When you want a performer you can count on . . . remember Pro-Banthine. Tradition does.

SEARLE Research in the service of medicine.
G. D. Searle & Co., Chicago, Ill. 60680

Pro·Banthine®
(propantheline bromide)

the traditional ulcer treatment



Pro-Banthine 15 mg. propantheline bromide

Pro-Banthine 15 mg. propantheline bromide with Dartal 5 mg. thiopropazate dihydrochloride

Pro-Banthine 15 mg. propantheline bromide with Phenobarbital 15 mg. warning: may be habit forming

Pro-Banthine P.A. 30 mg. propantheline bromide in time-release form

Pro-Banthine 7½ mg. propantheline bromide Half Strength

Pro·Banthine®
(propantheline bromide)

Indications: Peptic ulcer, gastroenteritis, pylorospasm, biliary dyskinesia, functional hypermotility and irritable colon.

Contraindications: Glaucoma, severe cardiac disease.

Precautions: Since varying degrees of urinary hesitancy may occur in elderly men with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug. Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.

Side Effects: The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

Dosage: The maximal tolerated dosage is usually the most effective. For most adult patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthine is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type vials of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours, intramuscularly or intravenously.

Pro-Banthine® 15 mg.
(propantheline bromide)
with
Dartal® 5 mg.
(thiopropazate dihydrochloride)

Indications: Peptic ulcer, spastic constipation, nonspecific gastritis, functional gastrointestinal disorders, pylorospasm, hyperhidrosis, irritable bowel syndrome, mucous or ulcerative colitis, functional diarrhea.

Contraindications: Glaucoma, severe cardiac disease.

Warnings: Pro-Banthine with Dartal should not be administered to patients who are under the influence of barbiturates, alcohol or narcotics. The drug should be administered cautiously to epileptic patients or those in depressed states, patients with liver disease and to pregnant women. Hypersensitivity to Dartal may occur rarely in patients with known sensitivity to similar drugs.

Side Effects: Dryness of the mouth, mydriasis, hesitancy of urination; less commonly extrapyramidal (restlessness, dystonia and signs of pseudoparkinsonism such as muscular rigidity, fixed facies, tremor, ataxia, festinant gait and drooling), parasympatholytic (blurred vision, xerostomia, hypotension, nasal congestion and constipation) and curare-like (loss of control of voluntary muscles, particularly the muscles of respiration) reactions. Rarely, leukopenia or allergic purpura. A generalized erythematous skin reaction may occur. Side effects characteristic of phenothiazines such as grand mal convulsions, altered cerebrospinal proteins, cerebral edema, potentiation of the effects of atropine, heat or phosphorus insecticides, autonomic reactions, endocrine disturbances, reversed epinephrine effect, hyperpyrexia or pigmentary retinopathy may theoretically occur but have not been reported with Dartal. Severe hypotension following recommended doses occurs more commonly in patients who are also afflicted by other medical disorders such as mitral insufficiency or pheochromocytoma, and particular attention should be paid to such a possibility although this has not been observed with Dartal.

Adult Dosage: One tablet three times a day.

Pro-Banthine® 15 mg.
(propantheline bromide)
with
Phenobarbital 15 mg.

Warning: May be habit-forming.

For *Indications, Contraindications, Precautions, Side Effects* and *Dosage* see Pro-Banthine. In addition, phenobarbital should be administered with caution to patients with liver disease, mental disturbances or a significant degree of hypoxia.

Pro-Banthine P.A.®
prolonged acting brand of propantheline bromide

For *Indications, Contraindications, Precautions* and *Side Effects* see Pro-Banthine.

Dosage Form: Capsule-shaped, compression-coated, peach tablets of 30 mg. for oral use.

Dosage: The recommended initial dosage is one tablet in the morning and one at night.

084

SEARLE

Research in the service of medicine.
G. D. Searle & Co., Chicago, Ill. 60680

Achrocidin® Tablets and Syrup

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen Citrate 25 mg.

ACHROCIDIN Tetracycline HCl—Antihistamine—Analgesic Compound Tablets and Syrup are recommended for the treatme of tetracycline-sensitive bacterial infection which may complicate vasomotor rhinitis, sinusitis and other allergic diseases of t upper respiratory tract, and for the concomitant symptomatic relief of headache and nasal congestion. For children and elder patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN Tetracycline equivalent Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 m

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliati dermatitis; photosensitivity; onycholysis, n discoloration. *Kidney*—dose-related rise BUN. *Hypersensitivity reactions*—urticar angioneurotic edema, anaphylaxis. *Intracran* —bulging fontanels in young infants. *Teet* yellow-brown staining; enamel hypoplas *Blood*—anemia, thrombocytopenic purpu neutropenia, eosinophilia. *Liver*—cholestasis high dosage.

Upon adverse reaction, stop medication a treat appropriately.

Cerebral Training

ERNST SCHMIDHOFER, MD
Consultant in Cerebral Training
Division of Psychiatric Training
Department of Mental Hygiene and Correction
State of Ohio
Chillicothe, Ohio

Cerebral training constitutes a very highly structured, massively standardized regimen that makes use of neurophysiologic principles rather than psychiatric concepts—cerebral mechanisms instead of mental dynamisms. It is a nonmedicinal, controlled, methodic, organized, sustained training program which concerns itself with the systematic and orderly cultivation of continuing and progressive self-potentiated self-development.

In this article, cerebral training is presented in a manner designed to appeal to a broad scientific audience. Its interest value is both general and interdisciplinary. The methodologic technic employed has wide significance as well as extensive utility.

There are 60 applications for cerebral training. It may be used in treating alcoholism, cancer, drug addiction, or organic disease, or in programs with delinquents, parolees, prisoners, school dropouts, or the underprivileged. Cerebral training may also be used in community health centers, mental hospital wards, stroke centers, and training schools. It may also be used for youth programs or physical rehabilitation, prevention, or manpower development programs.

Cerebral training is easy from three standpoints. First, it is easy for trainees to learn and apply. Second, it is easy for institutions to include and employ. Finally, it is easy for instructors to acquire and impart.

Class Instruction Period

With cerebral training, the medical model has been abandoned and the educational approach adopted. The physical setup of each **class instruction period** in cerebral training is more academic than therapeutic. During each instruction period, I am a teacher and a trainer, not a theorist or therapist. My approach is not that of the physician. Instead, it is one of an instructor.

The people who come for help are not patients. They are trainees. They are not sick. They merely have an unnecessary degree of cerebral disorganization. We do not use group therapy techniques; we have class instruction periods. We adopt the view that very many disorders and derangements have been learned which, in turn, can be unlearned. Therefore, during the training sessions, continuous attention is paid to the mechanics involved in learning, unlearning, relearning, and overlearning.

Each class instruction period consists of three parts. At the beginning of each part, the instructor goes through the **chalkboard routine.** This consists of writing five items on the chalkboard: Do not think negative thoughts! Do not waste your time! Review! Reflect! Resolve!

Part I of each class instruction period is the **auditing portion.** This consists of listening to a tape-recorded interview that I have made with an advanced trainee. This trainee professes to have learned, with telling effectiveness, to apply the various principles of cerebral training to himself, to his symptoms, to his problems, and for his development.

During the auditing portion, the trainees listen to the many benefits and learn of the many technics from the tape-recorded interviews. Whenever an outstanding achievement or a remarkable attainment is described, the members of the class silently think to themselves: "If *he* can do it, *I* can do it! If *he* can do it, *I* can do it! If *he* can do it, *I* can do it!" or, "If *she* can do it, *I* can do it!" This perseveration is vigorously continued throughout the time the advanced trainee on the tape-recorded interview is describing his accomplishments.

Part II of each class instruction period is the **cogitating portion.** It has three subdivisions: **review, reflect, resolve.** These are periods of silence. For one minute the trainees review their past constructively; for two minutes they reflect over their present wholesomely; and for three minutes they resolve about their future decisively. Appropriate instructions and directions as to what to do and how to do it are issued repeatedly by the instructor.

Part III of each class instruction period is the **achievement portion.** Under the controlling aegis of the instructor, information is educed from one trainee after another for the benefit of their classmates. Each trainee talks about his achievements and just how he went about making them.

There are over 235 tape-recorded interviews that have been made. Their playing time ranges from 12 minutes to 20 minutes. The first recordings were

made in 1946. Over the years, they have provided a library of extraordinarily diverse diseases and disorders. The settings under which they were made have been quite varied: a Veterans Administration hospital; a state training school for boys; an alcoholism division of a hospital; a community college; a group practice clinic; and in a private practice session.

The **reinforcement period** is one of the sessions which takes place outside the class instruction period. During the reinforcement period, each trainee is encouraged to talk to a partner or to a small group of fellow trainees. From time to time throughout the day and evening, for about 30 seconds at a time, each trainee is to tell his classmates just how he plans to continue to practice cerebral training for himself and with his family after he returns home and reenters the community.

Practice Procedures

The practice procedures employed by the trainees include **cerebral exercises** which constitute self-instructions. These take the form of simple phrases which are usually repeated silently.

Flashback consists of recalling the congenial surroundings of practice sessions and past experiences at the time of a possible imminent disagreeable encounter.

Action sessions consist of acting out before a full-length mirror, with an exaggerated degree of confidence and success, certain anticipated settings and situations of the future.

The principle of **project into the future** consists of the effective concurrent combination of an appropriate cerebral exercise and a suitable visual image.

Visual images consist of both reality and fantasy constructions of a strongly positive and highly successful nature.

The fifth paragraph of the instructional procedure titled **Saturday Morning Routine** reads: "So every Saturday morning while you are dressing, remember to pull out this Symptom List and reread it. As you contemplate your steady improvement regarding them (that is, your symptoms) you will experience, progressively, the deep satisfaction and the glow of success felt by those trainees who came before you."

The list of handouts comprises a four-page itemization of materials. The handouts in cerebral training are issued under the general headings of **informational set, operational set,** and **procedural set**. The informational set is subdivided into groupings for the sophisticated specialist, the interested professional, and the intelligent layman. The operational set has two subdivisions—preliminary and ongoing. Both are for persons who take the course itself. The procedural set provides the materials for the instructor when he conducts the class.

Among other things, each trainee is issued a coil-spring notebook and pencil. He is enjoined, in a stipulated manner, to make certain entries in a specified fashion.

There are 30 training manuals which have been written for each trainee. The sixth in the series, for example, is entitled "Class Instruction #2". The 17th in the series is "Your Proper Use of Visual Images". The 23rd is "The Patient Makes Himself Well #4". And the 29th is "Cerebral Exercise #10".

The largest number of trainees which have been instructed in a class instruction period is 164. Contrary to the registered expectations of many persons, the larger the classes, the better the results may be.

The Instructor

Let us assume for the purpose of argument that cerebral training compares favorably with any other method of its kind, anywhere. If this were true, the potential value would be reduced appreciably if its innovator were the only one who could use it. Accordingly, literally hundreds of hours have been spent in writing the information in a style which is direct, simple, and clear, so that selected individuals can become effective instructors in just a few hours.

It is easy to become an effective instructor in cerebral training. This is true principally when one considers all the things it is not necessary to do. For instance, it is not necessary to spend years in arduous preparation, nor to have several advanced degrees, nor to undergo special training. It is not necessary to take long series of extensive study courses, nor to assimilate mounds of technologic information, nor to go through months of difficult practice sessions under highpowered supervision.

There are 22 categories of personnel listed on the card titled **potential instructors**. These range from alcoholism counselors through teachers.

Assume we have selected a promising candidate from one of the 22 groups on the register of potential instructors. What is available to this candidate to facilitate his period of training? For one thing, there is an **instructor's guide**. Whereas the guide contains 24 chapters, these comprise only 132 pages. It is desirable but not essential that the aspiring instructor read this guide.

Instructor's Cards

Suppose our potential instructor has not read the instructor's guide. Assume the time has arrived when he finds himself standing before a class of 100 or more trainees, with 90 minutes to fill from the time he greets them with a cheery "Good morning!" to the time he closes with a crisp "Class dismissed!" What should he do, and how does he do it? What

should he say and how does he say it? The answers to these questions are available to him on six sets of **instructor's large cards.**

Each set takes care of an entire class instruction period. There are from 16 to 18 cards in each set. They tell him exactly what he must do and how he should do it, as well as what he should say and how he should say it, each step of the way, from the moment that he begins the class instruction period up to the time that he terminates it.

Certain topics should be brought out and certain questions should be raised during the achievement period. But what are the topics? And what are the questions? Once again the instructor's life is made easier because the topics to be covered and the questions to be asked have been written out for him. They appear on the ten **instructor's small cards.** Each of them covers an entire achievement period. These ten **topic cards** are titled **arthritis, automatics, cerebral exercises, main symptom or trait, manuals, pain, single achievement, skepticism, sleep,** and **visual images.**

So, in essence, it may be stated that the principal ingredient for a suitable applicant to be an effective instructor in cerebral training is that he be a good reader.

Future plans call for continuing revaluation of this method, especially for improvements and refinements. They also call for an attempt to reduce the disparity between the profusion of those who sorely need help, and the paucity of those who can capably deliver it. The basis for selection of instructors in cerebral training will be determined less by degrees awarded and honors conferred in the past, than by competence demonstrated and qualities possessed at the time of selection. This training program will make it possible for people with little or no extraordinary training to bring about modification of behavior which compares very favorably with that reported by the rank and file professionals.

Those more sophisticated workers whose life styles are not too rigid or those who do not feel easily threatened, those who have a zest for life, those who enjoy taking calculated risks, and those who are sufficiently interested will also be warmly welcomed.

Research Supporting Cerebral Training

John W. Gardner,[1] President of the Carnegie Foundation and a past Secretary of HEW, has written, "The most hopeful thing today is that on *some fronts* we seem to be achieving patterns of organization that avoid the stultification, rigidity, and threats to freedom inherent in monolithic integrations. If this is true, it may be the most important single fact in our future."

I have been repeatedly astonished by the vigorous insistence made in writing and in speech by behavioralists who contend that the ingenuity of the therapist is sorely taxed in developing an hierarchical series of graduated progressions to desensitize the patient with minimal discomfort. The reason for my astonishment stems from the fact that I have found it not at all necessary to tax my ingenuity with such strenuous demands. I simply instruct my trainees in a brief and general way in the mechanics and procedures.

For example, they concentrate on the image of seeing themselves unafraid in a phobic situation. At the same time, they repeat to themselves silently and fixedly the cerebral exercise, "I'm *not* afraid, I'm *not* afraid, I'm *not* afraid, I'm *not* afraid."

The first sentence on one handout reads: "The symptoms listed below are representative of those from which trainees have learned to free themselves." Then follows an inventory of 122 symptoms ranging from aching feet to weak erection, and from always tired to worried.

Miller [2] has commented on the strength of the belief that instrumental learning of glandular and visceral responses is impossible. He feels that it is only against a cultural background of great prejudice that such weak evidence as exists could lead to such strong convictions as prevail. He reports a considerable degree of success in bringing about the learning of visceral and glandular responses. From his work on animals, he conjectures that if patients are aware that they can secure some control of their symptoms, this will provide strengthened motivation in that direction. He feels that this principle and the technic for bringing it about would have application in the field of clinical medicine. He gives such examples as cardiac arrhythmias, spastic colitis, asthma, and certain forms of vascular hypertension.

Shapiro, et al,[3] present impressive data with respect to the effects of feedback and reinforcement on the control of human systolic blood pressure.

Fetz [4] has written on the operant conditioning of the activity of single neurons in the precentral cortex of unanesthetized monkeys. To those who are unfamiliar with these developments, it should seem plausible that if so delicate and small a structure as a single neuron can be influenced in that manner, surely the same principles should pertain in such gross structures as the heart, blood vessels, and stomach. That such indeed is the case has also been recorded by Kimmel,[5] as well as by Katkin and Murray.[6]

At one point in its development, cerebral training was put into operation for two years in a large hospital. Among the largely unmotivated semi-deteriorated and semi-dilapidated schizophrenics and those with chronic brain syndromes, there were one or more of the following clinical entities: lobotomies, epilepsy, alcoholism, cerebellar atrophy, paralysis agitans, choreiform movements, ruptured interverte-

bral disc, arthritis, spinal fusion, phantom limb, amputation ulcers of the foot, cirrhosis of the liver, stroke, intermittent claudication, Addison's disease, cervical metal brace, diabetes, angina, and cancer.

The patients suffering from that heterogeneous group of afflictions met five mornings a week for 1½ hours. Such manifest conditions as paralysis agitans, cirrhosis of the liver, stroke, Addison's disease, diabetes, and cancer can only be treated at a symptomatic level with cerebral training. However, for these conditions and for other diseases and disorders, symptomatic amelioration is at times remarkable, and for some disturbances may be complete.

The circumstances of a trainee's disorder and the setting of the operation determine the frequency of the classes. Minimally, they are held once a week. For an outpatient clinic or in a community health center, the optimal number would be twice a week. In all instances, the class instruction periods last 90 minutes.

Prevention

Because he has already succeeded in learning how to overcome large problems in his course in cerebral training, it becomes easy for the trainee to cope with small ones when he returns home. He has learned how to keep little ones from becoming big ones. By simply applying the very same principles he has used successfully in overcoming his ailment, he immediately quashes the slightest and the earliest sign of its reappearance. If a trainee can regain normalcy through cerebral training when he is weak, then surely it will be possible for him to prevent the recurrence of his particular affliction through cerebral training when he is strong.

Furthermore, by using the various principles with modification of some of the technics, there is much reason to believe that the advanced trainee can prevent the occurrence of other diseases, disorders, disabilities, and derangements that may affect him later.

Success of the Program

So far, the results of this program have been gratifying, although the measures employed are incomplete and subject to error. They consist of observations by the instructor, attestations by the trainees, affirmations by hospital personnel, and confirmations by relatives, employers, and public health nurses.

The trainees report gratifying degrees of success and in much less time than is given in many accounts I read and hear about. Manifestly, the behavior of unsophisticated patients can be determined by a highly-charged attitude of expectancy.

That the results of this method should be subjected to scientific validation afforded by rigorous experimental design with proper controls, randomization, independent scorers, uninformed evaluators, etc, is incontestable. Meanwhile, it is felt that the claims made should be received with no more and no less reservation than that which is accorded the ordinary pilot study or demonstration project.

Berkson,[7] Cartwright,[8] Glover,[9] Goldstein,[10] Mainland,[11] Mowrer,[12] and Schor,[13] are among those luminaries who have indicated that many, if not most experimental designs are constructed so poorly that they are meaningless or even worthless. Controls are inadequate, randomization is lacking, and the statistical treatment is improper. Up to the present time, circumstances have not been favorable for the development of a tightly-knit experimental design involving cerebral training. Conditions have been sufficiently adverse as to preclude an outcome research study in terms of effects that could be measured accurately and reliably. Therefore, I have chosen no design, rather than a poor one.

It has been possible to make this approach available in the form of a **package program.** All the essential ingredients have been incorporated as a self-contained unit. It includes tape recorders, cassettes of tape-recorded interviews, a stopwatch, manuals, notebooks and pencils, and the instructor's paraphernalia. This package is available now in a serviceable form and is ready for delivery anywhere.

Summary

1. Cerebral training is a self-help training program for self-potentiated self-development.
2. It is easy to learn and easy to apply.
3. It uses the educational approach.
4. Trainees participate actively in the process of contributing substantially to their own progress.
5. Each trainee receives 30 training manuals which contain supplemental instructions and injunctions.
6. Selected persons can become effective instructors in a few hours.
7. Multifarious conditions can be dealt with concurrently, and with large groups at the same time.
8. Technics for preventing recurrence of the same condition or development of new ones are built into the operation.
9. The program can be packaged and delivered to needy areas.

In the absence of clear neurological signs, the recognition of brain disease may be uncertain. This fact applies particularly to those cases in which the specific mental changes indicative of brain disease are not obviously present, but are masked by the signs of emotional disturbances, usually not associated with cerebral pathology.

Neurological States Masquerading As Psychoses

DIETRICH BLUMER, MD
Psychiatric Liaison Service
The Johns Hopkins Hospital
Baltimore

Depressive, paranoid, manic, and catatonic reactions, approximately in this order of frequency, may be present in association with impairment of cerebral functions. Hysteric or obsessive-compulsive reactions have also been observed imbedded in the course of a brain disease.[1]

Any of the well-known mental disturbances may be part of a brain syndrome. The disturbances are often fleeting and variable in their occurrence but, at times, persistent. Occasionally, they may last far beyond the estimated impact of the noxious factor.

Marked anxiety is very frequently found in patients with acute cerebral impairment and often is a reaction to the frightening deficit. In contrast, the majority of the cited emotional disturbances, with their typically unpredictable course, probably have to be understood as the direct result of cerebral irritation. For diagnostic purposes, all these emotional disturbances have to be clearly differentiated from those mental traits which invariably are associated with cerebral impairment. Various authors have proposed different terms for the two sets of mental changes, as noted in Table 1.

The terms "organic" and "functional" represent a false dichotomy and should not be used. S. Cobb,[2] among many others, has pointed out that function cannot be thought of without some degree of structural change. The term functional refers to the performance aspects of certain structures. While neurologists correctly refer to idiopathic epilepsy as a functional disorder of the central nervous system, this same illness is considered an organic condition in psychiatry. Much confusion could be avoided by adherence to the correct use of the terms.

Romano and Engel's [3, 4] terminology of primary and secondary mental signs of cerebral impairment appears to be well chosen and will be used here. Table 2 contains the primary signs as they are reported in the literature.[5-7]

Table 1: Terminology For the Two Sets of Mental Changes Observed in Cerebral Impairment

Specific for Cerebral Impairment	Not Specific for Cerebral Impairment	Author
exogenous	endogenous	Bonhoeffer
obligatory or basic	optional or accessory	Stertz
heteronomous	homonomous	Kleist
symptomatic	genuine	Küppers
primary	secondary	Romano & Engel

Table 2: The Primary Mental Signs of Cerebral Impairment

Signs	Manifestations
1. "clouding of consciousness" (defect signs)	impairment of: attention * coherent thinking * memory * orientation; especially characteristic is the slowness and easy fatigability of intellectual performance
2. release of lower-level mental activities (productive signs)	hypnagogic reveries, disquieting dreams, dream-like experience while awake, delusions, hallucinations, and illusions
3. defective attempts at intellectual readjustment	circumstantiality * perseveration * confabulation suggestibility
4. characteristic affective response	affective lability: * rapid shifts from tears to laughter, from anxiety to anger
5. disturbance of the wake-sleep regulation	insomnia or somnolence

* signs that remain in the chronic cerebral impairments

The basic mental status examination given to all the patients is outlined in Table 3. All patients studied, with the exception of Case 4, were seen on several occasions. The interviews lasted longer than one hour if it appeared important to get an estimate of the effect of fatigue on the patient's performance. Care was given to insure the best possible cooperation from the patient during the examination. In all

patients, again with the exception of Case 4, a close relative was interviewed in order to get an estimate of the course of the illness and of the premorbid emotional adjustment.

Table 3: Mental Status Examination

1. **Check orientation in three spheres (person, place, time).**
2. **Ask for specific events of the very recent past.**
3. **Ask for the names of the last five presidents, and five of the largest cities in the United States.**
4. **Ask the patient to remember a given address; check recall five minutes later.**
5. **Give a few calculations (vary according to premorbid intellectual level of patient).**
6. **Ask for serial subtraction of 7 from 100 (or 3 from 21).**
7. **Check ability to recall increasing numbers of digits forward and backward.**
8. **Ask for the similarity between two objects (eg, bird and bee, apple and tomato).**
9. **Ask for interpretation of three proverbs (chosen according to premorbid intellectual level of patient).**
10. **Ask patient why he is in the hospital.**

The impact of a given cerebral impairment varies enormously with the premorbid make-up of the patient.[4, 8] Persons with a well-functioning mental organization compensate better for cerebral deficits than others who had premorbid psychological difficulties. It appears that the secondary signs, as the more personal aspects of behavior, vary particularly according to the premorbid personality and in relative independence from the type of noxious factor. The primary signs, on the other hand, appear to be more of an impersonal nature, varying with type and intensity of the noxious factor.[3, 4] They alone are the reliable indicators of brain damage for the psychiatrist.

Study of Five Patients

The patients studied here were referred to the neurosurgical service of The Johns Hopkins Hospital because a cerebral lesion was originally suspected. They all presented with marked emotional disturbance, at a time when only equivocal or no physical signs of a brain disease were obtained. Consequently, they were referred for psychiatric evaluation.

Case 1

K.H. was a 53-year-old man, married, and a sales manager.

History: This patient had been emotionally well adjusted and in good health until he developed a tremor of the right hand one year prior to admission. He then developed a tremor of the left hand. He became forgetful, generally slow in his reactions, and easily tired, which coincided with the time he assumed a new and more responsible job.

Psychiatric Evaluation: The patient was stiff and slow in his motions. He was friendly and cooperative, and slow and deliberate in his speech. Mental status examination revealed that he had a very poor recent memory, particularly for names. His thinking was slow and perseverative. He had a tendency to stick to insignificant concrete details (eg, the interviewer's tie). He also had difficulties in grasping new ideas. His understanding of proverbs was below the expected level. Often, he was unable to pronounce complicated words. Occasionally he was confused at night, wandering into other rooms and delivering incomprehensible messages to other patients. He was aware that he was not doing well in his new position, but his affect was not abnormal and he was free from any depressive thoughts.

Impression: He was diagnosed as suffering from marked diffuse cerebral impairment. His retardation was due to brain disease, which simulated a depressive reaction. The new demands of his more responsible position had led to the decompensation of his performance. Gross primary signs made the diagnosis easy, but true secondary signs were entirely lacking.

Follow-up: Shortly after the psychiatric examination, a pneumoencephalogram showed marked diffuse atrophy of the brain. A brain biopsy was refused. The final diagnosis was advanced cerebral arteriosclerosis. However, a presenile psychosis or a "primary atrophy" of the brain could not be ruled out.

Comment: The patient reportedly had been a stable individual before his illness. Although a marked deterioration of his performance was now present, secondary signs of brain disease were absent.

Case 2

A.G. was a 48-year-old woman, married, and an accountant.

History: This patient, the mother of five children, had been well adjusted and free from any major illness. Six months prior to admission, she left a job that she had held for one year. She complained of some trouble with her eyesight. The next job she took she lost after one week, which upset her very much. On a third job, she was happy at first, but then began to feel the boss was overly critical of her and gave her too much work. Being in no financial need, she quit this job, and then felt better. One week later, on Easter Sunday, she woke up com-

plaining of being nearly blind. She was now very upset, and cried frequently. Shortly thereafter, she was admitted to the hospital. She had been in the process of passing an examination to be licensed as a certified public accountant. She had obtained good grades on the first part of the examination, but may have felt that she was under some pressure to successfully pass the upcoming final test.

Physical Evaluation: A left hemianopsia was the only consistent neurological finding, but this was somewhat doubtful because she often complained that she could not see at all.

Psychiatric Evaluation: This patient was entirely cooperative, always anxious, and often tearful for brief spells without apparent provocation. Her memory was somewhat hazy, eg, she was not sure of her own address. On serial 7, she made two gross mistakes: when asked to repeat the series, she proceeded slowly and correctly until she was incapable of subtracting 7 from 23. She perseverated occasionally in her talk. We had clearly proceeded to talk about her second daughter, when I realized she continued to tell me about her first daughter. She abstracted poorly on proverbs. When she was asked to write down her own name, she misspelled it, using too many arches on the letter "m"—another perseverative tendency.

Impression: In the presence of a number of primary signs of cerebral impairment, the diagnosis of brain disease was made. The secondary sign, the hysterical reaction, may have been the patient's reaction to her shortcomings. The easy tears were not a sign of depression, but of the cerebral impairment.

Follow-up: A brain biopsy was negative, as is often the case. One year later, the patient still had her left hemianopsia, was less anxious, but had remained unable to return to her former level of functioning. The diagnosis of Schilder's or Pick's disease was suspected, but not further confirmed.

Comment: This patient with previously good emotional adjustment showed secondary signs (anxiety and conversion hysteria) which had, to a certain degree, masked the presence of brain disease. The few clear-cut primary signs permitted the diagnosis.

Case 3

G.D. was a 48-year-old man, married, and a missionary.

History: This patient had been free of emotional difficultics and had led a very active life. He was stationed overseas. Six weeks prior to admission, he accidentally struck his head against the opened hood of his car. This incident was recalled one week later, when his wife began to notice that he had lost his usual zest and would often repeat himself. Again, a few days later, he complained of confusion. He had a headache and vomited on the following day, then spent three days in bed. He felt very depressed and stated that, for the first time in his life, he could understand why people committed suicide. He belittled his complaints and repeatedly refused medical help. When he finally submitted to a medical examination, he was advised to fly home and enter a hospital. The report of the referring physician stated that the patient was alert, but disoriented as to time, and that he tended to lose the thread of a conversation. A loss of distinctness of the disc margins was also noted.

Physical Evaluation: A complete work-up for brain disease was negative. No significant abnormality of the fundi of the eyes was found. The reported injury to the head was felt to be insignificant. A conglomeration of abnormal blood vessels on cerebral arteriography could be interpreted as a harmless malformation. In view of the marked depression, he was referred for psychiatric evaluation.

Psychiatric Evaluation: The patient was very cooperative and tried to be cheerful. He did not remember the names of any of his physicians. He was confused about the date. When asked for the last five presidents, he could not name Kennedy, referring to him as "the one who was killed". He named four of the five largest cities, then added Annapolis. On serial 7, he made two gross mistakes and was unable to subtract further once he had reached 23. He kept insisting that he felt so much better, but after a prolonged interview, he appeared tired and dispirited.

Impression: History and mental status gave definite evidence of a marked cerebral impairment. The depressive reaction was interpreted as a secondary sign.

Follow-up: In view of the lack of clear physical evidence of brain disease, further investigation was postponed. The patient was discharged into the care of a relative who was a physician and was given an early return appointment. He never came back. We learned that he suddenly had to be hospitalized elsewhere. Upon craniotomy, a brain tumor was found.

Comment: A brain disease had caused apathy and depression in a previously active and zestful man. In this case, no circumstances of the life situation could have explained the depressive reaction which was a secondary phenomenon of brain disease.

Case 4

H.P. was a 51-year-old woman, divorced, and a sales manager.

History: The patient reported that four months prior to the psychiatric evaluation, she "hosed off the

car, threw her briefcase on the back seat, turned around to look for her purse, and went in a stroke." The "stroke" consisted of sudden left-sided jerking of the limbs and numbness. She became "hysterical", called her daughters and the police. Similar "strokes" had reoccurred since, several times every day, in varying intensity. She freely related the miseries of her past and present life. A mother who had been "mental" all her life had become more vicious since she had become senile and was "nagging her to death". Three marriages, with men who were either sadistic, sexually abnormal, insane, or who displayed combinations of these traits, had ended in divorce. One daughter from her first marriage suffered from convulsions, was nearly deaf and blind, and had four children. The second daughter, who had "a chip on her shoulder" and various physical troubles, was involved in her second unhappy marriage and had five children to care for. All along, the patient had helped her family out as much as she could, while she held a good job for the last 21 years. Just a few days prior to the onset of the patient's illness, her younger daughter's husband had gotten drunk and had become abusive toward his wife and the patient. His wife now planned to leave him. The patient had not slept and worried all night about how she could care for the five children. On the following morning, the initial episode of "stroke" took place. She felt that God was telling her through this illness that she should not burden herself with the daughter's problem and that the illness might also teach her humility, since she had always been so independent.

Physical Evaluation: The patient was seen by a neurologist and a neurosurgeon. Physical findings were essentially negative, with the exception of a mild nonspecific abnormality of the EEG. Since she cried very often and was oddly detailed and persistent about the circumstances of her life situation, she appeared to chiefly present a psychiatric problem. The possibility of a neurological disorder was remotely considered. No further neuroradiological studies were planned at the time.

Psychiatric Evaluation: A single two-hour psychiatric interview took place, on an outpatient basis. The patient was communicative and very circumstantial in relating her history. She stated that she had become progressively less alert over the past eight years and was tiring more easily. She had experienced difficulties with her memory of recent events for two years, and more so for the past six months. Her daughters had told her for some time that she was repeating herself frequently. She had always been emotional, but for the past few months would cry very easily. This trait was manifested during the interview. She made only one mistake on serial 7, but seemed tired. She recalled only four large cities in the United States when she was asked for five. She forgot Eisenhower when asked for the last five presidents. No other shortcomings of her intellectual functions were noted.

Impression: It was tempting to interpret the patient's illness as a neurosis with psychophysiologic manifestations. However, circumstantiality, affective lability, and memory deficit were clearly primary signs of cerebral impairment. In addition, this woman, until recently, had been able to function in spite of a continuous series of crises. She was referred back to the neurologist and the neurosurgeon with a note describing the psychological evidence for relatively diffuse brain damage.

Follow-up: Her peculiar emotional behavior was so impressive that further action was deferred. The patient called the examiner a few weeks after the examination to relate what she had figured out. She said that her mother had placed a curse on her some months ago for not being an obedient daughter, and predicted the punishment of sickness and death. Under the influence of this curse, so she believed, she was now subconsciously bringing this illness upon herself, which actually was no "illness". Patients with conversion reactions are not known for such insights. This enhanced the conviction that brain disease was present. Finally, she was readmitted to the hospital. A pneumoencephalogram demonstrated the presence of a mass, and upon craniotomy a tumor posterior to the right motor strip was removed. It was at first felt that the tumor had been totally excised, but the histopathology proved that this was a widely infiltrating glioblastoma.

Comment: The upsetting events immediately preceding the patient's illness can be thought of as a "red herring" finding, similar to the head injury reported in Case 3. However, it also represented a stress factor precipitating overt manifestation of illness due to the brain tumor.

Case 5

R.N. was a 37-year-old married physician.

History: For about two months prior to his admission, this patient suffered from dizziness, nausea, headaches, and anxiety with marked agitation. All this had started following an episode of "seafood poisoning". He came to the hospital from abroad for neurosurgical evaluation.

Physical Evaluation: No significant findings were obtained.

Psychiatric Evaluation: The patient was in a constant state of panic. He would exclaim, "Doctor, doctor!" or, "Where is my wife?" His wife had to be at his bedside at all times to hold his hand or to feed him. He was unable to carry a conversation. Frequently, particularly when someone approached him, he would sit up, nauseated and retching. In view of the patient's limited knowledge of English, the

constant agitation and the obvious emotional disturbance, a formal mental status examination was not done. Grossly, his level of awareness appeared to bc intact. His wife reported that two days prior to the onset of the illness the patient's close friend and brother-in-law had died. The patient had recommended that his brother-in-law go to Houston for a heart opcration and, once there, he had died on the operating table. It was also learned that the patient had becn pampered, first by a mother who had been mentally ill, then by his wife. He was not aggressive in pursuit of his carecr and "had to be pushcd". Several months before, he had accepted a leading position in a hospital, but he did not feel secure with the increased responsibility.

Impression: This chronically dependent man apparently had been pushed into a position which was more demanding than he desired. The death of the brother-in-law, for which he felt responsible, had precipitated an acute anxiety reaction with psychophysiologic reactions and possible underlying dcpression.

Follow-up: Due to an increase in the patient's agitation, he was transferred to a psychiatric ward. He left there after only two days and returned home. Meanwhile, an increased level of protein in the CSF was reported (60 mgm) and his physicians were advised that a pneumoencephalogram should be done to completc the studies. A few weeks later, upon craniotomy, an inoperable tumor was found.

Comment: It remains an open question whether a careful mental status examination would have permitted recognition of the basic disease.

Conclusion

Although only a small number of cases have been presented, certain conclusions can be drawn concerning the recognition of brain disease in patients with emotional disturbance.

The presence of a few or several of the primary signs of cerebral impairment is decisive for the diagnosis. It is not necessary to rely on a single primary sign. Deficits of recent memory and of the serial 7 performance appear to be particularly significant. The latter test is easy for a normal person of average intelligence, yet it represents a relatively sustained and complex task: the ability to subtract, retention of the last number reached, and memory of the task itself are simultaneously tested. Therefore, the test is easily failed in the presence of a degree of clouding of consciousness. Similarly, the simple but precise question of naming five of the largest cities in the United States or the last five presidents may become surprisingly difficult. Affective lability, as found in Cases 2 and 4, is not typical of an emotional disturbance, but is pathognomonic for cerebral impairment.

All cases, including the misdiagnosed Case 5, demonstratc the importancc of a protracted examination of the mental status with careful observation of the primary signs. Even though a complete physical evaluation may be negative, the presence of primary signs of cerebral impairment remains diagnostically significant.

The secondary signs are apt to mislead the diagnostician. Clearly, cerebral impairment has to be suspected if someone with intact premorbid personality unexpectedly begins to show signs of emotional disturbance. On the other hand, one needs to be particularly cautious not to miss recognition of a brain disease because of the plausibility of a neurotic or psychotic devclopment (Cases 4 and 5). Such an interpretation may seem to explain the symptom pattern of an illness and the time of its manifestation (secondary signs), but will not explain its origins.

The patients in Cases 2 and 3 reportedly had been emotionally very stable, yet they also displayed marked secondary signs with their brain disease. A more intimate knowledge of their premorbid personalities might have allowed a better understanding of these reactions. For a full understanding, one would need to have a much more precise knowledge of the psychological effects of the various cerebral lesions as well.

Finally, it should be remembered that the distinction of primary and secondary signs of cerebral impairment chiefly serves a diagnostic purpose. In reality, the two sets of mental changes are constantly interacting. The leading primary sign, clouding of consciousness with impairment of attention, thinking, and memory, implies an impairment of ego functions.[4] The most highly differentiated mental functions appear to be the most vulnerable to cerebral disease. The associated emotional disturbances, the secondary signs, are largely a result of the primary ego changes. Such a view would explain why only the primary signs are specific for cerebral impairment.

The task of discriminating between organic and functional illness involves recognizing those subtleties that may misguide even the most experienced clinician in making a correct diagnosis. This paper is concerned with separating those patients with true psychiatric problems from those who have been mistakenly classified as psychiatric, when they unfortunately have organic reasons for their problems—subdural hematomas, brain tumors, multiple sclerosis, etc.

Diagnosing Organic Psychosis

An Appraisal of Reality

The reality of our environment encompasses the perception of daily living, which is a summation of multiple pieces of information received through the central nervous system. Reality also reflects our selective perception of those events which take place within the total environment. If this reality is congruent with that which actually exists in our environment, then one considers perception to be normal. When there is a deviation from this standard, others become concerned and regard this as a measure of abnormal thinking, feeling, or behavior.

Viewing the problem simplistically, one might consider the brain as a type of mechanical monitor. With such an operational model there may be several areas in which potential difficulties could arise.

First, there can be a distortion of reality if the perceptive apparatus is malfunctioning and there is no input data. When input data is absent, as in the case of sudden blindness or traumatic amputation, it illustrates the end-organ deficit and the absence of sensory information necessary for accurate perception.

Even though the input information is accurate, such data must first be collected, identified, and organized before it can be synthesized and used, if it is to be meaningful. Afferent sensory pathways help in discerning size, shape, texture, touch, heat, pain, and space relationships, as well as many other inputs. Visual reinforcement, hearing, tasting, and smelling all contribute to the enormous data impinging on the central nervous system. Once received, these separate data require cerebral functions to be effective, including memory, abstraction, conceptualization, symbolization, etc. In computer language, input data must be codified for reference purposes. This inability to codify and synthesize input data is reflected by clinical measurements and labeled descriptively as confusion and disorientation.

Finally, the response to assimilated information accurately perceived and integrated may reflect impairment and be interpreted as reflecting abnormal thinking, feeling, or behavior. Pure motor aphasia illustrates this type of deficit. The individual may recognize the object presented to him and know its use and function but is unable to call it by name. In other words, the individual receives and integrates the incoming information but is incapable of appropriately responding to the signal received.

Homeostatic Mechanisms

The nervous system is known for its limited regenerative powers following injury. The homeostasis of the central nervous system is maintained through compensatory mechanisms in the face of cerebral impairment. Although these compensatory mechanisms may be under partial conscious or unconscious control, by and large they reflect either a psychological reaction to the loss of functioning tissue, or the recruitment of more primitive but less impaired levels of central nervous system function.

An example of conscious recognition of diminishing cerebral faculties is the appointment book carried in a man's breast pocket. This functions as a stimulus for memory recall and compensates for the loss of cortical neurons with the aging process. In a similar fashion, the familiar night light by the bed stand helps the elderly patient to increase his perceptual cognitive abilities by structuring his environment and permitting him a greater feeling of comfort and security. The night light compensates for decreasing visual, auditory, and cortical monitoring

efficiency by orienting the patient to the reality of his immediate surroundings.

Organicity

In 1884, Hughling Jackson [1] postulated that the central nervous system was a hierarchy of differing levels of function and that the greater the complexity, the more recent its evolutionary development and degree of specialization.

Therefore, in the presence of insult to the central nervous system, these higher specialized functions seem to be the first to suffer. As might be expected, there is a loss of abstractive thinking and the uncovering of more primitive concrete responses which reflect a lower level of functioning.

As an illustration, unlocking the door with a key represents an habitual and concrete act that requires little cognition. If the key does not fit the lock, one would recognize that either it was the wrong key or that perhaps it was the wrong door. This reflects an abstractive ability to assess a series of conceptual alternatives when faced with momentary failure, ie, not being able to open the door. On the other hand, to continue to force the key with an automatic and repetitive movement would be a measure of the inability to change the engram imprinted cortically which says, in effect, that the key should turn the lock. It also tends to negate the possibility of considering alternatives.

Signs of organic brain damage are relatively easy to discover if one is alert to them. Some signs are confabulation, circumstantiality, and perseveration.

In confabulation, the patient makes up stories. It is as if the individual assumes that he should have the necessary information at hand and will agree, therefore, in an effort to please the examiner. Thus, by talking in a knowledgeable fashion, the patient helps in denying the extent to which his memory is impaired and may, in fact, begin to actually believe his story.

Circumstantiality is the circular rambling patients exhibit when they attempt to grasp a word or thought. It reflects their inability to screen out important from unimportant information, as seen with frontal lobe damage.

Irritability is frequently encountered with cerebral impairment. Although it may stem from multiple sources including those which are psychological, sometimes the irritability is directly related to the injury. To some extent, irritability represents tension release within the central nervous system which may occur when inhibitory influences of the cortex are impaired. The hyperacusis with temporal lobe damage or the thalamic syndrome with extreme hypersensitivity to touch are examples of irritability.

Irritability can be compared to pathological reflexes or to other abnormal movements found in the central nervous system, which are a result of the loss of higher function controls. Chorea, hemiballismus, and the cogwheel tremor in paralysis agitans are examples of this type of release phenomenon.

Memory loss, particularly for recent events, is very common. One should be alert to people who forget some things and not others, as such conditions may be mistaken for memory loss when aphasia may be the basis for their difficulty. Impaired judgment reflected by loss of integrative capacities also demonstrates impulsive overreaction in the face of diminished capacities.

Psychological Defense Mechanisms

The psychological mechanisms used in coping with cerebral impairment are seen in conscious and unconscious denial. There is, however, some evidence to suggest that denial may not be entirely psychological but may, in fact, reflect the lack of integrity of the central nervous system. To this latter point, the examiner's interpretation of denial in the patient regarding his paralyzed side is sometimes seen with cerebrovascular accidents in the frontoparietal area.[2]

In addition, psychological defense mechanisms are in evidence in those individuals who refuse to accept the reality of their disability and thereby deny it, or those, for example, who project their feelings by unjustly blaming the physician for not preventing the illness. Finally, there are those who overcompensate by attempting physical and mental tasks for which they are no longer suited.

The regressive behavior and the tendency of patients to preoccupy themselves with bodily functions and somatic complaints, for example, reflect other psychological means for coping with these stress situations.

If one studies an organically impaired subject given a task and allows the individual to persist unsuccessfully, one may witness what has been described as a catastrophic reaction. This is manifested by an emotional outburst or a rage reaction, frequently accompanied by confusion and, at times, with physical assaultiveness. The behavior reflects the patient's response to the impairment of higher central nervous system functions characterized by hyperirritability, increasing tension release, and finally, psychological collapse.

If these people are studied over a period of time, one discovers that despite the fact that their impairment remains essentially unchanged, there seems to be a tendency towards a decreased incidence of catastrophic reactions. This is not necessarily a measure of behavioral improvement but rather a result of developing awareness regarding stressful situations and the individual's tendency to isolate himself and to avoid those states leading to further failure and frustration.

Establishing the Diagnosis

The anatomical correlates of early neurological disease mimicking various psychiatric disorders help to clarify the protean nature of the types of symptoms that may be presented by a patient. The associational pathways connecting topographically distant areas of the brain are possible through superficial and deep longitudinal fasciculi and U fiber connections between proximal gyri. Therefore, in lesions in the frontal lobe area it is possible to develop temporal lobe symptoms via the uncinate fasciculus or occipital lobe symptoms through other associational pathways.

The brain is essentially contained in a nonexpansible box. Our concerns are not for space-occupying lesions in the posterior fossa, which usually are diagnosed early in their development because of their proximity to specialized tracts and nuclei. Our principal concern is for the space-occupying lesion in the frontal lobe area, which is capable of considerable growth and expansion before the development of such obvious neurological signs as long-tract symptoms or papilledema.

Chapman and Wolff [3] indicated that in patients with as little loss as 30 to 60 gm of cerebral tissue, it is possible to detect impairment of imagery and curiosity, reluctance to undertake new adventures, loss of spontaneity and rapid learning, and the tendency to become disorganized under stress.

The difficulty in separating such a description of early cerebral impairment from the description of an individual developing a depressive reaction is indeed an extremely difficult task. There are, however, several specific suggestions which may be offered.

A carefully detailed history of the individual's employment, his social contacts, and his relationship with other family members, all become extremely valuable. Taking a detailed history from several people such as the spouse, an employer, or a fellow worker may effectively document chronological changes and help establish an early diagnosis.

Depressive Reactions

Depressive reactions (except for a few) have clearly associated life factors which antedate the depressive episode. There are usually other examples of psychological instability found in the patient's life as one listens closely to the background information given by the psychiatric patient with depressive symptoms. Many patients have recurrent adjustment problems in life—they may develop overly-dependent relationships with others, or they may be hypersensitive and react with feelings of rejection and are inclined, in short, to make mountains out of molehills.

The diagnosis of a depressive reaction should be made with extreme caution in a relatively well-adjusted individual with a stable family and employment situation and in whom antecedent events are lacking to explain the onset of the depression. The diagnosis should be held in suspect and an organic basis for the depression should be carefully looked for. It should be remembered that psychological stress can also precipitate an underlying organic illness and each individual case requires careful evaluation.

Toxic States

There are, in addition, a variety of toxic states which may resemble psychoneuroses or psychotic illnesses. Most physicians are familiar with the bizarre reactions patients have to scopolamine, narcotics, barbiturates, and alcohol. In these instances, the physician can easily identify the patient's medications and quickly withdraw the offending agent. There are, however, those self-prescribed medications which may create organic states resembling functional illness and may be a diagnostic problem.

One must make specific inquiries concerning medications used, since this type of information is frequently not volunteered or even remembered by the patient. It is worthwhile asking family members to bring in all medicines used in the home, including patent medicines. When medications are taken daily, patients are likely to overlook them as specific medicants as they constitute actions that are taken for granted.

A medical problem encountered in as high as 4% of some psychiatric clinics in the United States is that of acute and chronic bromide intoxication.[4] Since bromides are available in a variety of proprietary medications, they are, in effect, an inexpensive form of tranquilizer for those with limited funds and who have realistic life problems. Although relatively rare in younger age groups, bromide intoxication occurs with increasing frequency after the age of 30 and, as might be expected, is particularly prominent between the ages of 50 to 70.

Like many central nervous system depressants, the ingestion of bromides creates symptoms related to its pharmacological effect. When taken for ordinary headaches, bromides give temporary relief. Their use is followed by obtunding of CNS functions with apathy, irritability, generalized dulling, and, unfortunately, the return of the headache. Often this leads to a desire to continue taking additional bromides in an effort to alleviate the aftereffects of withdrawal and its rebound phenomena.

In an earlier study [5] in a city of 200,000 people, 65,000 lb of one major bromide-containing proprietary medication was sold in one year. Sixty-five thousand pounds is equivalent to 7,250,000 doses of bromides containing 150 mg each. When serum levels approximate 100 to 150 mg per 100 ml of blood serum, bromides are considered toxic and

symptomatic and may lead to confusional states, hallucinations, memory defects with confabulation, or the creation of stories, delusions, and neurological signs of organic brain disease. It is frequently misdiagnosed as schizophrenia and these patients unfortunately are admitted to mental institutions. Recognizing the preference many physicians have in prescribing bromides, it is suggested that prescriptions be written as nonrefillable in order to maintain some control over their indiscriminate use.

Huntington's Chorea

Degenerative central nervous system diseases such as Huntington's chorea can be overlooked in favor of a functional illness. Huntington's chorea was first described in 1872 by tracing a hereditary disorder within Dr. Huntington's own family, through an account of the disease in his grandfather, his father, and himself.[6] The disease is thought to be transmitted via a single dominant gene with incomplete penetrance. The neuropathologic lesion is related to its degenerative changes in the nerve cells of the putamen particularly in its posterior aspect and also in the head of the caudate nucleus. Over time, the cerebral hemispheres atrophy and the white matter is affected more than the gray.

Huntington's chorea is best described as a genetically-determined degenerative disease associated with abnormal choreiform movements, usually behavioral changes, and progressive dementia. The establishment of an early diagnosis is extremely important in an effort to limit progeny within the patient's family. In a series of 35 cases of Huntington's chorea that were reviewed, the earliest symptoms noted were behavioral changes. A common complaint is restlessness with associated unexpected behavior. There can be, for example, promiscuous sexual acts or behavior reflecting poor judgment and viewed as antisocial. As the disease progresses, the patient may be misdiagnosed as schizophrenic. With the appearance of choreiform movements, the diagnosis becomes self-evident and there is, over time, the development of grimacing facial movements, dysarthria, general incoordination, and the dancing ataxic gait so characteristic of this disease.

The degenerative disease is associated with depressive episodes and a high suicide rate. Dementia ordinarily is a later development. The individual patient must face a deteriorative process with progressive, uncontrollable, abnormal movements in the face of relatively intact intellectual functions. What may seem a product of the disease may, in reality, reflect the patient's psychological reaction. This distinction needs to be made in the patient's management.

Porphyria

Porphyria is sometimes misdiagnosed as a psychiatric problem if a patient presents himself with anxiety and vague symptomatology. The mental symptoms may be mistaken for an anxiety neurosis or a psychotic reaction and the inconstant neurologic signs and symptoms may not help in clarifying the underlying disease.

In this Mendelian dominant disorder, the presenting complaint may be abdominal pain without localizing signs and can be confused for gallbladder, intestinal, or pancreatic disease. It should be remembered that an acute attack may be precipitated by barbiturate ingestion. The diagnosis of porphyria, using Ehrlich's reagent, is a simple procedure and its early detection may be helpful in aborting a severe attack of porphyria.

An Approach

In the not too distant past, surveys in public mental institutions revealed that as many as 5% of those patients autopsied had brain tumors. Unfortunately, there are no easy operational rules that one can follow in separating curable neurological lesions from that group of psychiatric patients with the diagnostic label of neurosis or psychosis. Perhaps the physician's single most useful tool is listening very carefully, with a high index of suspicion, to the patient's history. To the astute clinician, early signs of organicity can be detected as easily as the assessment of early decompensation in the cardiorespiratory system.

The distinction between functionally deranged and organically deranged patients can be ascertained by listening carefully and assessing the total functioning status of the individual. Frequent reexaminations will help to detect the minor changes or deteriorative processes within patients. It is essential to develop a high degree of curiosity and perhaps some professional suspicion for underlying disease.

All of us become experts retrospectively. When we consider those occasional central nervous system diagnoses that are missed by most physicians, the subtle differences in symptoms of a particular case contrasted to functional neurotics and psychotics become more apparent.

The author expresses his appreciation to Dr. Barbara Hulfish for her comments and suggestions.

Physicians frequently encounter patients showing disturbed behavior for whom a differential diagnosis may be both difficult and crucial. This can be especially true as it relates to functional versus organic or toxic psychoses.

Organic Versus Functional Psychosis: Differential Diagnosis

VIRGINIA HUFFER, MD

University of Maryland Hospital
Baltimore

Neuroses

While the term neurotic is commonly used to describe individuals who show certain manifestations of maladjustment, actually defining the word can be exceedingly difficult. The psychoneurotic disorders are characterized by anxiety, which is directly felt or expressed, or which may be defended against by various psychological defense mechanisms.

Patients with psychoneurotic disorders do not exhibit gross distortion or falsification of external reality. They do not have delusions or hallucinations and they usually do not battle with gross disorganizations of personality. Patients in this group suffer from anxiety reactions, phobia, conversion, obsessive-compulsions, and neurotic depressive reactions.

Character Disorders

Individuals with character disorders do not use mental or emotional symptoms to secure adjustment but make use of certain patterns of behavior or actions. They usually do not have much overt anxiety but have their own, usually lifelong, behavioral ways of dealing with people and problems.

Probably the most common group in the average, middle class population is that of the obsessive-compulsive personality. These individuals are rigid, meticulous, fastidious, and are riddled by doubt. They are the chronic worriers. They lack a normal capacity for relaxation. They are stubborn and have a great tendency to "split hairs". They often are harassed by their sense of responsibility and have difficulty in making decisions.

Another common group is composed of individuals who are exceedingly emotionally labile. They are usually women who tend to exaggerate everything to get attention. They are easily frustrated and do not have the ability to stick with a task.

Other groups include the chronically inadequate, the schizoid, and the paranoid personalities.

Psychophysiologic Reactions

The term psychophysiologic reaction is used synonymously with the word psychosomatic to describe such well-known conditions as peptic ulcer, ulcerative colitis, and functional hypertension. Under the somatic disorder, almost any sort of psychiatric picture may be found. The range is from a relatively well-integrated person, to a severe neurotic, to a seriously disturbed person who functions to a certain extent in a psychotic way, with little ability for reality testing.

Psychoses

Psychoses are classified as either functional or organic. The schizophrenic (functional) disorders may be broken down as acute and chronic, and the process may be accurately described by these terms. The chronic process is one in which there is a gradual, insidious but progressive deterioration of the individual over the years. The acute schizophrenic process can appear in a matter of hours to days. This is not to say that the signs of emotional disturbance were not present before the acute breakdown.

Schizophrenias are manifest in several ways. They all show, to a certain degree, a disturbance in the reality relationships and concept formations. They also show emotional, behavioral, and intellectual disturbances. Their behavior is marked by a strong tendency to retreat from reality, by an unpredictability in their stream of thought, and by various regressive types of behavior. There may be some depressive aspects to this behavior, but it is important not to be confused by the word "depression" which the patient and relatives may use to describe the situation, and thus overlook the underlying schizophrenic process.

If antidepressive medications are given to an individual who is fundamentally schizophrenic, it will probably only make the condition worse.

The manic-depressive group comprises psychotic reactions which are marked by severe mood swings with a tendency to remission and recurrence. These individuals may have such manifestations as illusions, delusions, and hallucinations, but these are usually minimal, and the remarkable thing is the disturbance in the mood.

Classically, the manic shows elation or irritability with over-talkativeness, flight of ideas, and increased motor activity. Usually, the so-called elation thinly masks great hostility or depression.

At the opposite end of the pendulum is the depressed-depressed where there is marked retardation of thinking and actions. There may be delusions, usually concerning how evil the person thinks he is or his being sure that he has some dread disease. Guilt and worthlessness are all-pervasive in the depressed-depressed.

But more commonly, one sees the group that is referred to as the agitated-depressed. Such an individual, while feeling hopeless and helpless, does not think that he is worthless and makes constant demands for attention and help. There is a degree of agitation, significant bodily preoccupation, plus the insomnia and the anorexia that are usually present in all three of the manic-depressive groups. Infrequently, one finds these individuals sleeping or eating excessively as a last-ditch defense against an overt depression.

The organic states are those that are classified as either acute or chronic brain syndromes. In the acute, not only is the onset abrupt, but the situation is theoretically only temporary. There is diffuse involvement of the brain tissue function, but it is reversible if treated in time.

In the chronic brain syndrome, one finds relatively permanent, irreversible and diffuse impairment of cerebral function. With specific treatment this process may partially subside, but there is some residual destruction of the brain tissue. Of course, the acute syndromes may become chronic depending upon the rapidity and effectiveness of treatment.

Acute brain syndrome is synonymous with "delirium". There is a variable depression of function of the high cerebral centers short of coma. External and internal stimuli still reach the mind but there is a failure of recognition, integration, and control resulting in disordered perception, thought, and behavior.

The most common states, which present problems in differential diagnosis, are the acute schizophrenic states and the acute toxic conditions. A few definitions may be helpful in making differential diagnoses.

1. A delusion is a disorder of thinking. It is a false belief which may have started with a slight basis in reality, but as it becomes elaborated in the individual's mind, the delusion has a stronger meaning to him than has reality. Any attempt to demonstrate its falseness does not convince the individual.

2. The forerunner of a delusion is an idea of reference. An idea of reference is something that actually happens in reality such as a remark or an action from other people. In no way does it refer to the patient but is interpreted by him as being significantly related to him in some way that is malicious, accusing, or depreciating. An example of an idea of reference is an individual who gets on the bus and feels that other people are talking about him in some accusatory fashion. Actually, the people on the bus are talking, but not about him, and especially not in the malicious way in which the individual perceives it.

3. An hallucination is a false sensory perception. False perceptions may occur in any of the sensory modalities. The most common are experienced in the visual and auditory spheres but they can also be found in the touch, smell, and taste areas.

4. The forerunner of an hallucination is an illusion. An illusion is the result of a real sensory perception which is misinterpreted. These false perceptions are usually quickly corrected. For example, a patient who is delirious may say, "I know that that is a doorknob, but it looks like a cat's face."

A number of areas have to be considered when making the differential diagnosis between an acute schizophrenic process and a delirious process (Table 1).

Table 1: Differentiating Between Acute Schizophrenic and Delirious Processes

Mental Status	Functional (Acute Schizophrenic)	Organic (Acute Delirium)
Appearance and Behavior	Rarely useful differentially	
Emotional Reaction	" " "	
Stream of Speech	" " "	
Thinking Disorder	Ideas of Reference and Delusions Common	Not as Prominent or Fixed
Perception	Hallucinations (Auditory) Usually Prominent, Patient Secretive About Them	Illusions and Hallucinations (Visual and Auditory) Prominent
Orientation	Frequently Intact	Disturbed
Memory	Frequently Intact	Disturbed
Abstract Thinking		
Time of Occurrence	Anytime	More Intense at Night

Both types of patients may be quite disheveled and preoccupied. There is little to differentiate between the two except that the toxic individual appears to be quite pale, weak, and shows gross evidence of organic illness. The emotional reactions of both may range from detachment to panic, so this is not very helpful. The stream of speech of both may be quite disorganized and possibly incomprehensible. However, the delirious patient is more likely to speak spontaneously and look for help, whereas the acutely schizophrenic patient is less likely to be aware of others and more preoccupied with what is going on inside himself.

The schizophrenic is most likely to have ideas of reference. Delusions are also prominent. These delusions may be relatively simple such as, "They are out to get me". The "they" usually is rather vague. Or else the delusions may be very complicated, such as a delusion about a very highly organized spy system.

Delusions frequently reflect the culture of the time. For example, it used to be that these individuals thought that they were being talked about on the radio. Then it was the television that had some special influence on them. Now, many of them believe that things or people in outer space are maneuvering them. In an acute delirious process, ideas of reference and delusions are minimal to absent.

Hallucinations are less prominent in the schizophrenic. If he has any false sensory perceptions, he usually tends to be very secretive about them and is reluctant to tell anyone. If he has hallucinations, they most frequently occur in the auditory sphere. The voices will be accusing him. Seldom will he be able to identify the voice. If he has visual hallucinations, they tend to be ill-defined and of a mystical nature such as the shadowy figure of God. Hallucinations in other spheres are relatively uncommon and can only be ascertained with a lot of questioning.

In contrast to the schizophrenic, the delirious patient has illusions which progress to very prominent hallucinations. Visual hallucinations are most common in the toxic states; auditory experiences run a close second. Delirious patients tend to be exceedingly verbal about these hallucinations and after the acute situation is over, they will recall them in great and vivid detail.

The false visual perceptions may include imaginary flashes of light or colored forms, or they may be of quite complex scenes. One man saw a beautiful sailboat made of magnesium. Other patients have seen butterflies, kittens, funerals, and even little green pegleg men running up and down a wall.

The visual phenomena also include the familiar little bugs which the patient attempts to pick at, either on the bed, in the air, or on his skin. Occasionally the person imagines smells such as leaves or burning rubber.

The hallucinations in the auditory spheres of delirious patients tend to be of bells ringing, music playing, or streetcars clanging. Voices are usually identified as saying something that has been said in reality, such as the voice of a wife reprimanding a patient for drinking.

In addition to these, there are also toxic hallucinations. Toxic hallucinations are impersonal and have no dynamic meaning to the individual. For instance, the little green pegleg men running up and down the wall could not possibly mean anything.

A certain number of delirious patients will have the type of experiences that are common to a schizophrenic. They will actually feel that they are being

tortured by their hallucinations, which will put the patient into a panic state.

A few delirious patients will appear to have paranoid-like delusions. For example, a patient admitted with pneumonia may perceive that the orderly coming to take his rectal temperature is attempting homosexual assault. This patient, when taken to X-ray, feels that the machines are doing terrible things to him and he may go running out of the X-ray department.

One patient with typhoid had ideas of reference. She was sure that a policeman who just happened to come to the ward was going to take her to jail because of a criminal abortion that she had had some years before. This patient heard the nurses making some mention of a hot tub of water and immediately she thought that they were going to put her into it and scald her. In order to prevent being scalded, she took a pocket mirror and attempted to kill herself by slashing her wrists.

Two other very important areas differentiate the delirious patient from the acutely schizophrenic. These are orientation and memory. Both are disturbed in the delirious patient and intact in the schizophrenic. This recognition is exceedingly important.

Frequently, physicians who are discussing a schizophrenic patient express surprise at the fact that the patient is fully oriented and his memory is intact. But schizophrenics do not have problems in orientation and memory. The only times that they are disoriented are when they use time for symbolic reasoning, or when they have been so preoccupied with their inner experiences that they have lost track of time. Given a simple task to remember, they certainly will remember it.

However, in the delirious patient, because of his perceptual difficulties, orientation diminishes, first as to time, then as to place, and then as to person. In these areas of disorientation, they are most likely to make the unfamiliar become the familiar. Usually, the patient thinks that the nurse is his sister, and that the physician is his brother. The hospital becomes his home, or his school, or whatever is most familiar to him.

As his consciousness becomes more impaired, memory for immediate, recent, and past events, in that order, becomes clouded. It is quite common for the delirious patient to become more anxious and disturbed at night since there are fewer sensory guides to help him in his orientation. The shadowy darkness and the absence of familiar persons contribute to this. This accounts for the fact that there is a frequent report by night nurses that the patient suddenly became delirious. Most often the patient has already been delirious but did not manifest bizarre behavior during the day.

The causes for this delirious state are a mixture of low-grade fever, some dehydration, plus whatever other noxious agents may be present. The term "infective exhaustive psychosis" is an apt one to describe a situation where a number of factors contribute to the delirium.

In addition to the medical measures that are taken, it is helpful to explain to the patient that he is delirious. Most individuals who are able to comprehend anything have some knowledge of what a delirium is and they are at least transiently reassured to know what is happening to them. They may have felt that they were going crazy.

If the delirious patient can be kept in a room by himself where there is not much confusing outside stimuli, he will have less perceptual distortion. At night it is well to keep the lights on so there will not be so many shadows to be misinterpreted. It is helpful to have a family member stay with the patient. In addition, unless it is medically contraindicated, the phenothiazines, especially thioridazine (*Mellaril*) and chlorpromazine (*Thorazine*), are quite useful in cutting down the anxiety.

There are other cases where medical conditions present themselves as psychologic disorders. Acute intermittent porphyria, pernicious anemia, and endocrine disorders are three of these.

Acute intermittent porphyria is a grossly hysterical, delirious, or manic-like state which can be so prominent as to obscure any abdominal or neurological symptoms, which may or may not be present.

In pernicious anemia, the cerebral symptoms are not necessarily attributable to anemia and include dullness, apathy, irritability, and loss of concentration. All of these could add up to mild depression.

In endocrine disorders, the lethargy, psychomotor retardation, and fatigue of early hypothyroidism appear to be depression. The excitability, irritability and general overactivity of hyperthyroidism appear to be mania. The mental symptoms of hyperfunction of the parathyroid gland have received little attention. Headache and irritability and a loss of capacity to concentrate may be a result of the hypercalcemic state.

Since many hysterical phenomena accompanying hyperventilation can resemble the tetany of hypoparathyroidism, a problem in diagnosis may exist.

Adrenocortical dysfunction, hypo or hyper, as well as the steroids given as medication, may all result in profound psychological difficulties of a variable nature ranging from depression, to a paranoia, to a toxic-like psychosis.

With the ubiquity of psychotropic drugs, physicians would do well to take care in prescribing drugs to disturbed patients in order not to obscure metabolic, toxic, or other psychologic disorders. A thorough, differential diagnosis of a disturbed patient may be difficult for the patient to undergo, yet it is of the utmost importance in determining and treating his psychosis.

CALORIES / 7 oz. Serving*

There's a soup for almost every patient and diet ..for every meal and, it's made by Campbell

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

'NEOSPORIN'®

brand

POLYMYXIN B-BACITRACIN-NEOMYCIN OINTMENT

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

your medical faculty at work

by John Sargeant
Executive Director

The Council met on September 10, 1970, at Hershey, Pa., and took the following actions:

1. Granted Emeritus Membership to Robert B. Mitchell, MD, of Baltimore, at the request of the Baltimore City Medical Society;
2. Adopted financial statements through July 31, 1970;
3. Rescinded previous actions of the Council, taken in 1956 and 1963, that required the library to charge for the preparation of bibliographies;
4. Voted to take no action on a suggested protest to the Food and Drug Administration concerning the production of ampules of Vitamin B_{12} in 1,000 μg doses or higher. The suggested protest was requested by a Faculty member;
5. Received for information a communication from the AMA dealing with the Social Security Administration's receiving legal authority to direct fiscal intermediaries on how to determine Usual, Customary and Reasonable fee structures;
6. Heard a presentation by Mr. Chad Combs, AMA representative, on the AMA's Medicredit proposal;
7. Agreed to hold a special Council session to discuss the various proposals now before Congress on National Health Insurance, the Task Force Report on Medicaid and Related Programs made to the U.S. Secretary of Health, Education, and Welfare, the Foundations for Medical Care concept, and the current discussions taking place with representatives of the AFL/CIO;
8. Agreed to waive the 1970 dues for a member at the request of his component society;
9. Declined to adopt a motion that would have committed each Council member to make a contribution to Echo House, but urged each member to consider making such a donation. The Council also authorized mailing material concerning Echo House to all Faculty members;
10. Agreed to request full details from the Secretary of Health and Mental Hygiene on the prepaid medical programs reportedly negotiated with three medical institutions in Baltimore city. The Council also agreed to ascertain additional information concerning other areas of involvement in this connection, to be discussed at a future Council meeting;
11. Approved the change in name of the Future Nurses Club to the Health Careers Club, and endorsed Woman's Auxiliary participation in this endeavor;
12. Recognized officially the receipt of an additional $110 to be added to the Laughlin Award Fund, which now totals $3,420.95;
13. Heard that the courts had ruled that the petitions to referendum on a bond issue in Charles County were invalid. The petitions had prevented implementing legislation that authorized funding for additional beds at the Physicians Memorial Hospital in La Plata.

The Executive Committee met on September 10, 1970, and took the following actions:

1. Provided the Air Quality Control Advisory Council with the names of three physicians qualified to act as consultants to the Council;
2. Approved of the Faculty office maintaining a list of qualified persons who could assist in preparing grant applications to the federal government. The fiscal arrangements would be completed directly between those involved, with no Faculty responsibility or cost;
3. Agreed to proceed, in depth, with the Professional Liability Study and to investigate sources of funding;

(Continued next page)

4. Heard that several Professional Corporations formed under this new statute appeared to be illegal and that this had been brought to the attention of the State Department of Assessments and Taxation. The violations involved nonlicensed persons being included as incorporators or shareholders;
5. Approved development of a car rental program to be made available to Faculty members;
6. Authorized a $500 contribution, for educational purposes, to the MMPAC;
7. Agreed to ask component medical society officers to indicate whether they wish to continue receiving mailed copies of Executive Committee and Council minutes, as well as financial data;
8. Approved recommending to the Commissioner of Motor Vehicles the appointment of DeWitt E. DeLawter, MD, of Chevy Chase, to the Medical Advisory Board of the Department;
9. Approved a joint meeting with the Hospital Council Executive Committee on Thursday, December 10, 1970;
10. Determined that a representative group of the Executive Committee should meet with Kent County Medical Society officials to resolve a problem that has developed with the court system and law enforcement officers in that county;
11. Referred to the Ad Hoc Committee on Salmonellosis the question of adoption of the Responsibilities of a Medical Director (of a nursing home, ECF, etc.).

This emblem means a lot to you. It means more to your patient.

This is the symbol of Medical Equipment Unlimited pharmacies . . . source of complete lines of medical, therapeutic and convalescent aids . . . staffed with personnel expertly trained in the art of fitting these aids. An important service, both to members of the medical profession and their patients.

Letter to the Editor

Dear Sir:

In the August issue of the *Maryland State Medical Journal* I observed the comment about *The Johns Hopkins Medical Journal* and its "demise." The purpose of this letter is to give you definitive information about *The Journal* which, fortunately, has not died.

Economic considerations led the former editorial board of The Journal to recommend to the Advisory Board of The Medical Faculty that, unless vigorous support by the Advisory Board could be guaranteed, consideration be given to termination of the publication of The Journal. The Advisory Board concurred with the recommendation to discontinue The Journal. When the facts were presented to the entire faculty, however, that body expressed such overwhelming interest in the continuance of The Journal that the Advisory Board reversed its decision. Thus, a new Editorial Committee, chaired by Dr. Thomas B. Turner, Dean Emeritus, was appointed, a new editorial policy adopted, and The Journal survived. There will be no break in the continuity of publication, though there will be an understandable delay in the appearance of the July issue, the first issue under the new editors.

The Johns Hopkins Medical Journal, established in 1889 as the *Johns Hopkins Hospital Bulletin,* has a long and distinguished record, and the new Editorial Committee plans to publish, as stated in the new policy, "results of original research and reviews, especially of interdisciplinary interest to those working in the biomedical sciences, and to those in the broadest sense involved in the practice of medicine. It is designed particularly to reflect the contributions of present and former faculty, staff and students of the Johns Hopkins Medical Institutions. In addition, contributions from others are welcome." The present list of subscribers numbers over 9,200.

It seems appropriate that this information be brought to your attention, as you may wish to publish a correction in a forthcoming issue of the *Maryland State Medical Journal.*

Very sincerely yours,
R. Carmichael Tilghman, MD
Editor
The Johns Hopkins Medical Journal

A Chicago editor pinned this note on the bulletin board: "'Let's set our sights high. Let's learn to spell 'judgment' with out an 'e'." Signed: Deranged.

The next morning a reporter pinned a note on the bulletin board replying: "Dear Dranged: 'I tried to spell jusgment without and 'e' and it came out judgment. Now, I am in a predicament.—Confused'."

Osteoarthritis of the Knee

RENATO S. LAPIDARIO, MD
Assistant Professor
Division of Orthopaedic Surgery
University of Maryland Hospital
Baltimore

Osteoarthritis is primarily a process of degeneration of articular cartilage.[1] Degeneration causes incongruity of the previously smooth joint surfaces. Motion in the involved joint produces friction, flaking, fibrillation, and shedding of pieces of cartilage, which in turn irritate the synovial membrane. The cause of pain in osteoarthritis is not understood. Some investigators feel that it is produced by the reaction taking place in the synovium. Venous congestion and capsular fibrosis may contribute. As the process of degeneration continues, the cartilage is worn down. This exposes the subchondral bone to unusual pressure which responds by new bone formation. Marginal lipping or osteophyte formation results. Several areas of synovial membrane may undergo metaplasia to form cartilaginous or osteocartilaginous bodies. This is one source of loose bodies; another is fracture of marginal osteophytes. The process also affects the menisci, making them susceptible to injury.

With advancing age, degeneration occurs in almost all supportive structures, but the degree varies in different individuals and in different joints. Knees are more commonly affected by degenerative changes than other joints in the body.[2]

There are several factors that can cause or accentuate degeneration:

1. **Trauma:** This may be in the form of a direct external blow or indirect trauma as repeated displacements of loose or torn menisci, joint mice, and fractures. Irregular joint surfaces or loose bodies damage the articular surfaces. The pressure of carrying a heavy load, as when the patient is obese, also has a deleterious effect on the joint.

2. **Concentration of Pressure Load:** Normally in weight bearing, pressure forces are evenly distributed over the articular surfaces. When deformity exists, as in genu valgus or varus, the pressure forces are concentrated over a smaller area and degeneration occurs in these areas.

3. **Infection:** Proteolytic enzymes elaborated by infectious organisms destroy the cartilage, and irregularity of the joint surface results.

4. **Systemic Factors:** Any condition which causes damage to the joints, such as rheumatoid arthritis or ochronosis, can cause degeneration of the joint. Also, it has recently been shown that changes in the metabolic equilibrium may play a role in the susceptibility of the cartilage to osteoarthritis. For example, diabetic patients have been found to have an increased incidence and severity of degenerative joint disease of the usual types, in addition to the severe neuropathic changes seen occasionally in the ankle and the foot.[3] As observed experimentally, in mice made diabetic with anti-insulin serum, regressive changes were noted in the chondrocytes.

As mentioned earlier, the knee is more commonly affected by degenerative joint disease than any other joint. Usually, symptoms begin in the fourth or fifth decade of life or earlier if the causative factor is present at an early age. The patella is the site of the earliest and most profound changes in degenerative arthritis of the knee. Chondromalacia of the patella frequently starts the disease. The patellofemoral joint then becomes involved and erosion due

to friction follows. The irregular surfaces of the femoral condyle, in turn, damage the tibia.

Clinical Features

The patient complains of aching pain when moving and bearing weight, which is usually relieved by rest. Stiffness may be encountered after rest and freer movement is obtained with activity. The stiffness usually is relatively short in duration. Painful creaking and grating on active motion about the patella is an early finding. It is increased by any activity requiring contraction of the quadriceps, as in going up and down the stairs and arising from a sitting position.

Objectively, there is tenderness about the joint margins where the inflamed synovium protrudes, or over the lower margin of the patella. Crepitus at the under surface of the patella is common. If an effusion is present, the patella may be floating and crepitus may not be elicited. The fluid shows normal cytological and chemical findings, although it may contain numerous fragments of cartilage. Muscle atrophy, particularly of the quadriceps, is common due to disuse. In chronic cases, the bony margins are deformed and enlarged and range of motion is greatly reduced. Fixed flexion deformity is also usual. Involvement of the medial or the lateral tibiofemoral compartment will result in either a genu varus or valgus deformity. Greater pressure is exerted on the affected side and the ligaments on the opposite side are stretched. Locking may be caused by impingement of a hypertrophied synovium, displacement of a torn menisci, or a loose body trapped between the articular surfaces.

Radiological Features

In early cases, the roentgenographic appearance is usually normal. As the condition progresses, gradual joint narrowing is evident. With further degeneration, spurring or osteophytic formations at the joint margins are seen. Sclerotic subchondral bone and bone cysts appear in the subchondral portion of the bone at areas of maximum pressure. A gradual loss of height of the joint space of the lateral compartment produces a valgus deformity and the opposite deformity when the medial compartment is involved. The patella may be thickened and sclerotic. Loose osseous bodies may be seen. The patellofemoral interval is narrowed and the opposing surfaces are dense and irregular.

Treatment

Once degenerative changes are present, the condition is irreversible, although there are ways to stop further progression of the disease. In acute episodes, the patient should be put to bed. No weight bearing should be permitted and, if necessary, crutches should be used. The knee may be immobilized by a cast, a splint, or with Buck's traction. Heat, preferably moist heat, aids in relieving pain and muscular spasm. If all movement is painful, muscle setting and non-weight-bearing exercises should be employed until acute inflammation has subsided. These exercises can be performed without motion in the joint. No passive motion should be done. As long as joint pain, tenderness, and swelling are present, it is advisable to use immobilization so that muscular spasm is not aggravated. Following evidence of improvement, the period of splinting is gradually diminished. Active motion of the involved knee through as wide a range of motion as possible without pain, several times a day, should be performed together with active and resistive muscular exercises. Proper exercises, heat, and massage help to strengthen the muscles. Weight bearing is not started until acute inflammation has completely subsided and the muscles are strong enough to support the patient. If the quadriceps is still weak, a plaster cylinder may be used for support until full strength is regained.

In the presence of a flexion contracture, the deformity is corrected with the use of serial plaster castings or by traction. Under anesthesia, the knee is manipulated very gently, followed by application of a plaster cast. This is repeated as improvement occurs and physical therapy is instituted as soon as feasible. If no improvement is obtained with one manipulation, it is not wise to repeat the procedure. Skeletal traction or operation on the soft parts or upon the bones may be considered. Traction usually has fewer complications.

It is easier to prevent than to correct a deformity. Never place pillows under the knee for comfort as this is the most common cause of a flexion deformity. Resting in a chair for long periods should be discouraged. The use of night splints is very important since flexion of the knee is common during sleep. In cases where ankylosis is imminent, the part should be maintained in position of optimum function.

Even if the roentgenograms show evidence of severe degeneration, the knee may remain asymptomatic and functional, provided the quadriceps is strong and the joint is protected from trauma and abnormal strains. If the patient is overweight, weight reduction should be encouraged to lessen the load on the lower limbs. The early use of crutches will relieve some of the stress of weight bearing.

Drug therapy constitutes another part of the program. Medicines are only given to relieve the discomfort. At present, there is still no drug which can stop or reverse the anatomical changes of osteoarthritis. Acetylsalicylic acid is still the drug of choice. It is inexpensive, safe, and frequently as

effective as other drugs. Occasional patients may require antacids. For those allergic to aspirin, salicylamide, though less effective, may be used. Other drugs recommended for relief of pain are phenylbutazone, oxyphenbutazone, and indomethacin. These drugs are not without toxic effects. Patients should follow the recommended dosage schedule and proper precautions should be observed. Consideration should always be given to the contraindications to their use. Some patients, not helped by salicylates, may respond to one of these drugs. Usually, narcotics are not required. When such drugs are necessary to relieve joint pain, further investigation as to the etiology is mandatory.

A tender spot located about the joint interval may be injected with a local anesthetic. If improvement is not secured by a second treatment several days later, no further attempt should be made. Successful relief of symptoms has been attained by injection of steroids into the joint space. Its action is still not clear, but steroids are known to exert an anti-inflammatory action. Duration of relief of symptoms is variable from several days to months, with an average of about two weeks.

Some have recommended repeated injections as symptoms recurred,[4] but this should be viewed with caution. Lately, there have been several reports of complications following repeated injections at short intervals. One of these is the deterioration of the joint due to overuse, because of the masking of pain. Other complications reported are osteoporosis, aseptic necrosis, and secondary infection. When intra-articular steroid injections are used, the patient must be cautioned against excessive use of the injected joint. Injection should be given infrequently, should be performed under aseptic conditions, and the patient's condition should be followed closely.

Surgical treatment is indicated in some cases that fail to respond to conservative treatment. Occasionally, flakes of cartilage or loose bodies are present in the knee. When present, they may cause pain and locking and may lead to extensive degenerative changes. They should be removed surgically, preferably before degenerative changes become too severe. Also, degenerative changes may result from a torn or displaced meniscus and removal is indicated when this diagnosis is made. Localized patellofemoral degenerative arthritis without involvement of the rest of the joint is an indication for patellectomy or patelloplasty. In reconstruction of the patella, the osteophytes at the margin are excised and the patella is then rounded. The under surface is trimmed down to the bleeding bone and is made smooth. Some have used an interposition membrane such as fascia lata sutured to the under surface with good results.

When a knee joint is extensively involved, a general joint debridement is indicated.[5] This consists of removal of all the accessible synovial membrane, osteophytes, diseased cartilage, abnormal soft tissues, and sometimes the patella. This operation was described by Magnuson in 1941. He reported many good results. Since then, the operation has had a fairly wide acceptance. No cast is applied after the operation, although a compression dressing is used. Quadriceps setting exercises are started as soon as possible and active exercises are started a few days later. The physiotherapy should be continued under the guidance of the physician and the therapist until maximum benefit is obtained.

If osteoarthritis of the knee is confined mainly to one tibiofemoral compartment and the range of motion is 90 degrees or more, it can be treated safely and reliably by a proximal tibial osteotomy.[6] Some surgeons prefer the distal femur as the site of the osteotomy. With involvement of one tibiofemoral compartment, there is usually a valgus or varus deformity of the knee. On weight bearing, greater pressure is exerted on the side of the knee that is mainly affected, and the ligaments on the opposite side are stretched. Proximal tibial osteotomy corrects the angulation and the joint is realigned, so that on weight bearing, the pressure is equally distributed throughout the joint. Excessive stress on the collateral ligaments is relieved.

If the joint is severely involved or the operations mentioned above have failed, arthrodesis of the knee is indicated. This is the only procedure that can be expected to permanently relieve pain and insure stability if marked deformity is present. It has the added advantage of early ambulation.

Some patients prefer to be spared arthrodesis, especially if one knee has already been stiffened. In this instance, arthroplasty may be used. This may be in the form of metallic replacement of the upper tibial surface, a mould arthroplasty of the distal femur, or the use of a total knee prosthesis. There are two types of tibial plateau prostheses, one designed by McKeever which has a T-shaped anchoring device, and the other by McIntosch which is D-shaped and comes in various sizes and thicknesses. The McIntosch prosthesis is best used when there is bone and cartilage involvement with loss of the height of the tibial plateau. The McKeever device is more appropriate when there is cartilage destruction only. Metallic devices have produced good results in some patients and poor results in others.

Summary

1. For acute episodes of osteoarthritis of the knee, bed rest, immobilization, moist heat, and muscle setting exercises are indicated.

2. Drug therapy is considered an adjunct in the treatment program.

3. It is easier to prevent a deformity than to correct one.

4. Surgery plays an important role and is often used to restore function.

Examination of Sputum Cells

Microscopic examination of fresh wet sputum can provide reliable information on the diagnosis and prognosis of chronic bronchitis, bronchial asthma, and asthmatic bronchitis. It should be done routinely for all patients with these obstructive pulmonary diseases.

In patients with sputum production as part of a disease, one can glean information pertinent to the abnormality through the intelligent examination of this material. Sputum always implies some abnormal process of the bronchopulmonary system and the cellular and noncellular components reflect the pathologic process.

After a minimum of experience in identifying the various leukocytes and mucosal epithelial cells in fresh wet sputum under the microscope, one can reasonably differentiate allergic from nonallergic inflammations. In the chronic "obstructive" bronchopulmonary diseases, one can differentiate chronic bronchitis (CB), chronic bronchial asthma (CBA), and chronic asthmatic bronchitis (CAB).

This report deals primarily with sputum cytologic examination in these chronic diseases. It should be kept in mind, however, that sputum examination supplements or reinforces other important diagnostic procedures, beginning with sound, thorough clinical evaluation, which includes roentgenographic studies and pulmonary physiologic testing as indicated. It is not a substitute for them.

Common Cells In Sputum

The more common cell types in sputum can be divided into those exfoliated from the bronchial epithelial layer, those arising from other pulmonary tissues, and those entering from the circulating blood. The numbers, types, and cytologic condition of the bronchial epithelial cells (BEC) reflect the abnormality of the bronchial mucosa.

Normally, the nuclei of all BEC's are ovoid to round, with a definite chromatin structure. Two nuclei may be seen in occasional cells.

The cytoplasm usually has a finely granular reticular texture. The basal BEC is small—usually about the size of the lymphocyte—and has the greatest nucleus-to-cytoplasm ratio. Its shape is generally ovoid, with a rather regular cytoplasmic border. Intermediate-layer BEC have a greater cytoplasmic mass with an irregular and more polygonal shape.

The columnar BEC that line the lumen are ciliated or, less commonly, the goblet type with its variably sized mucopolysaccharide vacuole. Both are roughly rectangular, often tapering to a long tail at one end. The nucleus often bulges out the cell membrane at this tapered end. The secretory system of the goblet cell is at the broader end, but may also bulge out the cell with its mucinous product.

The brush border of the ciliated BEC is also at this end, and the origins of the cilia just beneath the cell membrane appear as a dark line. The cilia themselves are very delicate, hair-like structures about 5μ to 7μ long in these unfixed preparations.

Local cells of the reticuloendothelial system are seen in the sputum and are an index of the host's cellular resistance. The presence of alveolar macrophages or histiocytes in a specimen is the best assurance that it arises from the lower respiratory system.

Lymphocytes and monocytes in small numbers appear fairly regularly in sputum.

Often, material of unknown composition may be seen in the noncellular part of the sputum. The ab-

Sanford Chodosh, MD, The New England Journal of Medicine, *April 9, 1970 (Vol. 282, No. 15).*

sence of nuclei and the bizarre "plastic" shapes that this material assumes separates it morphologically from cellular structures. This material is often referred to as "myelin degeneration".

Cells similar to histiocytes are frequently seen with a nucleus resembling that of a blood monocyte, from which it probably transforms. Plasma cells that are seen in sputum possess the round, eccentric nucleus with the characteristically dense chromatin, without the expected spokewheel effect.

Leukocytes from the circulating blood usually comprise the majority of all sputum cells and are a direct measure of the nature of the inflammation.

Cells in these wet preparations are seen in three dimensions without the artifact of fixation, so reorientation to this different perspective is necessary.

Included are the polymorphonuclear neutrophil (PMN) and the similar polymorphonuclear eosinophil (PME) cells.

In chronic bronchitis (CB) bronchial epithelial cells (BEC) may comprise 5% to 15% of all cell types. Usually occurring singly, most show pyknotic degeneration. The cytoplasmic mass is often reduced. Bacteria are occasionally seen in the cytoplasm.

The basal BEC with darker nuclei are smaller and may have crinkled-cell membrane. The intermediate BEC are difficult to differentiate from pyknotic basal types. The ciliated BEC are small with dark nuclei. Cilia are rarely present but the basal plate of cilia remains.

In stable CB, histiocytes may comprise 5% to 20% of all cell types; in acute exacerbation they may drop to below 5%. Often yellowish-brown in color, histiocytes are commonly seen with ingested particles of dust, bacteria, and lipids.

The blood-transported PMN may comprise 75% to 95% of all cell types, whereas PME may comprise less than 2%.

Usually there is a 1% to 2% concentration of monocytes, though it may rise to 5% to 15% while histiocytes are rising.

In chronic asthmatic bronchitis (CAB) tissue and blood cellular composition is most often the same as in CB, though some swollen BEC may be seen and the level of PME may rise to between 5% and 20%.

In chronic bronchial asthma (CBA) BEC may comprise 10% to 30% of cell types. Though single BEC are often seen, large clusters (Creola bodies) are more common during acute exacerbation. Hydropic degeneration (swelling) distorts the definition of the original morphology. Cytoplasm and nuclei of both basal and intermediate cells may be swollen.

Though cilia is usually present on swollen ciliated BEC, ciliacytophoria with loss of cytoplasm is often seen. Some goblet cells can be identified, though swelling of these cells often obscures structure.

In stable CBA, the histiocytes may comprise 10% to 50% of all cell types while they may drop to 5% to 10% during acute exacerbation. Usually yellowish-brown color is not seen, although crystallized yellowish particles are often seen in the recovery period of an acute CBA attack. Clear vacuoles are common in cytoplasm.

Blood transported PMN may comprise 2% to 30% of the total cell types; PME, 22% to 90%. (Charcot-Leyden crystals may be plentiful as well as free eosinophil granules.)

Requiring only a few minutes, microscopic examination of fresh wet sputum preparations should be a standard laboratory procedure in the initial and subsequent evaluation of patients with chronic obstructive pulmonary diseases.

Maryland Association of Medical Assistants

The Tenth Annual Convention of the Maryland Association of Medical Assistants was held on April 4-5, 1970 at the Holiday Inn Downtown. The featured speakers were William DeMaria, MD, Assistant Dean of Duke University Medical School; Mrs. Ruth Dize, President of the American Association of Medical Assistants; and Ronald Kornblum, MD, Assistant Medical Examiner for the State of Maryland.

Following an afternoon educational session and a banquet, Mrs. Dize installed the following officers of the Maryland Association of Medical Assistants:

President: Mrs. Jean Subock, of Annapolis (Baltimore Chapter)

Vice-President: Mrs. Frances Whittaker, of Rockville (Montgomery Chapter)

President-Elect: Mrs. Mabel Young, of Cumberland (Allegany Chapter)

Recording Secretary: Miss Sandra Orrison, of Wheaton (Montgomery Chapter)

Corresponding Secretary: Mrs. Ann Shultz, of Baltimore (Baltimore Chapter)

Treasurer: Mrs. Mary Minnick, of Cumberland (Allegany Chapter)

Mrs. Jean Subock (left) was recently installed as president of the Maryland Association of Medical Assistants. Miss Barbara Daniel (right) is immediate past president of the association.

The Tenth Semiannual Meeting of the Maryland Association of Medical Assistants was held in Ocean City on September 12, 1970. The convention activities were held at the Ship's Cafe, beginning with registration at 10 AM, followed by the business meeting.

The featured speakers for the afternoon educational session were Newland Day, MD, an internist from Baltimore who spoke on medicare. Theodore Kardash, MD, then spoke on abortion.

A unique addition to this year's semiannual meeting was an auction. Members of the association made articles to be auctioned, and Mrs. Lillian Burford, a charter member of the association, served as auctioneer.

The evening festivities began with a cocktail party on the terrace of the Ship's Cafe, followed by a banquet. The Master of Ceremonies for the evening was David Gilmore, MD, of Salisbury.

The programs for the convention were generously contributed by the Maryland Medical Service.

Baltimore Association of Medical Assistants

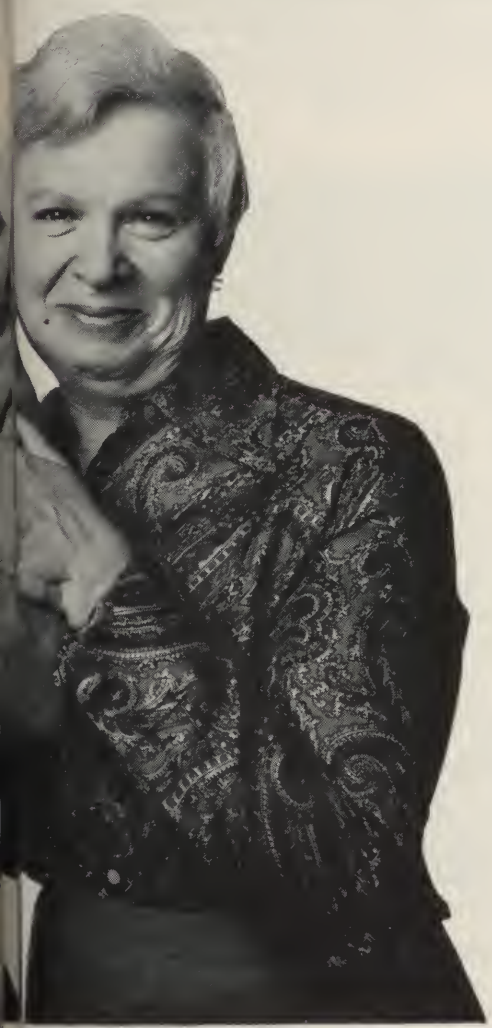
The speaker at the April meeting of the Baltimore Association of Medical Assistants was Andre V. Fesus, MD, whose lecture was entitled, "Vietnam as Seen by an Ophthalmologist". The lecture was accompanied by slides taken in Vietnam by Dr. Fesus earlier this year.

In May, the members of the Baltimore chapter entertained their bosses at the annual Bosses Night held at the Eastwind. The highlight of the evening was a skit presented by several of the members entitled "Laugh Out-Smash In".

The June meeting featured Louis E. Harmon, MD, as guest speaker. Dr. Harmon spoke on basic and general care of the skin, including proper shaving habits for the men, and a discussion of acne for adults as well as teen-agers.

Dr. Harmon

Menrium® treats the menopausal symptoms that bother him most.



ROCHE
Roche
LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

His wife has a lot of different menopausal symptoms, but only a few really irritate *him*. Her hot flashes, her vertigo, her palpitations—that's *her* problem. What really bothers him is her nervousness, her irritability and her excessive anxiety, often expressed by endless "book-shuffling, chain-smoking, reading-lamp" insomnia!

Menrium takes care of hot flashes, vertigo, palpitations in most menopausal women. Menrium provides the well-known antianxiety action of chlordiazepoxide (Librium®) and water-soluble esterified estrogens. It therefore relieves more symptoms than either component separately. It takes care of the vasomotor symptoms as well as the emotional symptoms. This means the symptoms that bother his wife most. And the symptoms that irritate him most.

So, to help them both get through *her* menopause, remember Menrium.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of manifestations generally associated with the menopausal syndrome—anxiety and tension, vasomotor complaints and hormonal deficiency states.

Contraindications: Women with cancer of breast or genitalia, except inoperable cases, and those with known hypersensitivity to chlordiazepoxide and/or esterified estrogens.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Exclude other possible causes of menopausal syndrome manifestations, such as pregnancy. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) similar to those seen with barbiturates have been reported following discontinuance of chlordiazepoxide HCl. Potential benefits of use in pregnancy, lactation or women of childbearing age should be weighed against possible hazards to mother and child. Clinical data inadequate on safety in pregnancy.

Precautions: In elderly and debilitated patients, limit dosage to smallest effective amount of chlordiazepoxide (initially 10 mg or less per day) to preclude ataxia or oversedation; increase gradually as needed and tolerated. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects—particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in patients with impaired renal or hepatic function. Paradoxical reactions to chlordiazepoxide (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients. Employ usual precautions in the treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation very rarely reported in patients receiving Librium® (chlordiazepoxide) and oral anticoagulants.

Adverse Reactions: Untoward effects seen with either compound alone may occur with Menrium. With chlordiazepoxide, drowsiness, ataxia and confusion reported in some patients, particularly in the elderly and debilitated; while usually avoided by proper dosage adjustment, these are occasionally observed at lower dosage ranges. Also reported have been a few instances of syncope; isolated occurrences of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido, and occasional reports of blood dyscrasias, including agranulocytosis, jaundice and hepatic dysfunction. Periodic blood counts and liver function tests advisable during protracted treatment. Changes in EEG patterns (low-voltage fast activity) observed during and after chlordiazepoxide treatment.

With estrogens, headache, nausea and vomiting, anorexia, gastrointestinal discomfort, dysuria and urinary frequency, jitteriness, breast engorgement, formation of breast cysts, skin rashes and pruritus occasionally seen. Administration may also be associated with uterine bleeding and/or followed by withdrawal bleeding.

Usual Dosage: One tablet t.i.d. for 21 days, followed by one-week rest periods.

Menrium® T.I.D.

5 mg chlordiazepoxide	5-2	0.2 mg water-soluble esterified estrogens
5 mg chlordiazepoxide	5-4	0.4 mg water-soluble esterified estrogens
10 mg chlordiazepoxide	10-4	0.4 mg water-soluble esterified estrogens

Diagnosis of Hyperlipidemia

SIMEON MARGOLIS, MD
Associate Professor of Medicine
Johns Hopkins University School of Medicine
Baltimore

An elevation of serum lipid levels has been clearly identified as an important "risk factor" associated with the increased rate of development of coronary heart disease. The results of many prospective population studies, including the well-known Framingham study, have unequivocally shown that elevated cholesterol levels are associated with a greater risk of coronary heart disease. More limited studies indicate that hypertriglyceridemia also predisposes subjects to coronary heart disease.

In addition to the danger of accelerated atherosclerosis, hypertriglyceridemia has been recognized as a cause of acute pancreatitis. Careful scrutiny of serum lipid levels is an important part of the diagnostic evaluation of patients with pancreatitis, especially when recurrent attacks occur in patients who do not overindulge in alcohol.

Because of the serious consequences of premature coronary heart disease and the availability of effective therapy for most patients, a strong argument can be made for obtaining screening tests of serum lipids in all patients. At the very least, lipid studies should be done on all patients with xanthomata, hypertension, obesity, diabetes, premature coronary or peripheral vascular disease, or a strong family history of arteriosclerotic vascular disease.

All serum lipids are transported in the blood as a part of four complex proteins: α, β and pre-β-lipoproteins, and chylomicrons. Hyperlipidemia occurs when the concentration of one or more of these lipoproteins is increased. Thorough evaluation, therefore, requires not only routine lipid analyses (cholesterol and triglycerides), but also a determination of which lipoprotein is responsible for the hyperlipidemia.

Fredrickson and co-workers have delineated five types of hyperlipoproteinemia based on separation of the serum lipoproteins by paper electrophoresis:

Type	Plasma lipid fraction elevated	Lipoprotein abnormality
I	Triglycerides	Chylomicrons present
II	Cholesterol	β-lipoprotein increased
III	Cholesterol and Triglycerides	Presence of lipoprotein with β mobility, but pre-β density
IV	Triglycerides	Pre-β-lipoprotein increased
V	Triglycerides	Pre-β-lipoprotein increased and chylomicrons present

Although the frequency of familial hyperlipidemia is unknown, Types II and IV are fairly common disorders whereas the other three types are rare. Types II and IV are associated with a high risk of premature coronary heart disease. Peripheral vascular disease is often a complication of Type III. Slightly less than half the patients with xanthelasma and essentially all patients with tendinous xanthomata have Type II hyperlipidemia. Planar xanthomata in

the palmar creases are highly suggestive of Type III. Tuberous xanthomata can occur in Types II, III, and IV. Eruptive xanthomata may appear dramatically whenever triglycerides rise to very high levels, but disappear promptly as the glyceridemia is controlled.

Laboratory assessment of serum lipids should be done after the patient has fasted overnight but is otherwise on his usual diet. Frequently overlooked is the simple, but valuable screening procedure of examining serum for lactescence. The presence of lactescent serum on a fasting specimen is always abnormal and diagnostic of hypertriglyceridemia. Serum will consistently appear lactescent when triglycerides are greater than 500 mg%. Lactescence may also occur at lower triglyceride levels, particularly in the presence of chylomicronemia. More information can be obtained if the serum is placed in a refrigerator overnight before it is examined. Since both pre-β lipoproteins and chylomicrons tend to aggregate at low temperatures, lactescence will develop in most sera with triglyceride levels greater than 250 mg%. Hypercholesterolemia alone, in contrast, does not produce lactescent serum. The combination of a serum cholesterol determination and careful examination of serum for lactescence will detect more than 80% of patients with hyperlipidemia.

The refrigerated serum sample can also be used to make a tentative diagnosis of the type of glyceridemia. Chylomicrons float to the top of the sample as a creamy layer. Isolated chylomicronemia (Type I) presents a floating layer of fat on top of otherwise clear serum. In patients with Types III or IV hyperlipidemia, lactescence will remain evenly distributed throughout the serum. Hyperglyceridemia due to elevated levels of both chylomicrons and pre-β-lipoproteins (Type V) presents as a prominent creamy layer at the top of a sample which is also diffusely lactescent.

Chemical determinations should include both cholesterol and triglycerides. Phospholipids and total lipids give little additional information, and their routine determination is not warranted. Because serum cholesterol and triglyceride levels tend to increase with age in our population, it is advisable to compare the patient's results with values obtained from normal subjects in the same age range. Thus, in one group of subjects without metabolic disease, the upper limits of normal for serum cholesterol were 230 mg% in subjects below age 20, and 240, 270, 310, and 330 mg% in the 3rd, 4th, 5th, and 6th decades respectively. Triglyceride values were considered normal up to 140 mg% in patients less than 30 and up to 150, 160, and 190 mg% in the 4th, 5th, and 6th decades respectively. All subjects whose serum cholesterol or triglycerides exceeds these values should be considered as possible candidates for therapy. Ideally, at least three lipid determinations, obtained at weekly intervals, are needed to confirm the diagnosis and to establish a pre-treatment base line.

When serum cholesterol is high and triglycerides are normal, a diagnosis of Type II can be made with confidence. Hypertriglyceridemia requires further studies to determine the type of abnormality. Lipoprotein electrophoresis will often distinguish between the five types. Unfortunately, it may be difficult to properly type lipoprotein electrophoretic patterns run on paper strips. In one study, five independent observers completely agreed on the typing in only 6 of 20 different sera. Two new techniques, electrophoresis on cellulose acetate or on agarose gels, yield sharper lipoprotein bands and promise to provide better patterns for typing.

These procedures, which are generally available in most laboratories, will allow a firm diagnosis on most patients with hyperlipidemia. An occasional patient may need tests that can only be carried out in a special laboratory. For example, Type III can be suspected when a "broad beta band" is present on electrophoresis, but quantitative ultracentrifugation is needed to establish this diagnosis. Type I hyperlipidemia can be confirmed by demonstration of decreased serum lipoprotein lipase levels ten minutes after an intravenous injection of heparin.

In addition to its occurrence as a primary inherited disorder, hyperlipidemia may present as a complication of the following conditions: diabetes, pancreatitis, nephrotic syndrome, chronic renal failure, obstructive liver disease, myxedema, excessive alcohol intake, pregnancy, use of oral contraceptives, glycogen storage disease, and multiple myeloma. Secondary hyperlipidemia may present as any of the five types, but Type IV is most common. Since treatment of the underlying disorder in such patients may return serum lipid values to normal, appropriate studies should be carried out to eliminate these conditions as a possible cause of the hyperlipidemia.

Although severe degrees of hyperlipidemia are invariably the result of a metabolic abnormality or are secondary to some demonstrable disease, modest elevations of serum lipids may occur in subjects who ingest large amounts of calories or animal fat. Such diet-induced hyperlipidemia is more frequent in countries with a high standard of living. In general, the hyperlipidemia in such subjects responds in a most gratifying manner to dietary measures.

Finally, since all types of hyperlipidemia may be genetically determined, family members, especially children, should be screened for elevated serum lipid levels so that treatment can be initiated before irreversible vascular changes occur. Familial Type II disease can be detected in affected children shortly after birth. In contrast, Type IV hyperlipidemia is often not manifest until the late teens or early twenties.

Baltimore City health department

Meeting the Challenges of Public Health in Baltimore City

JOSEPH GORDON
Director
Bureau of Health Information
Baltimore City Health Department

The Baltimore City Health Department has met the challenging changes of the sixties through progressive programs in every public health field. Not only has the department provided more health services than ever before in Baltimore's history, but it has provided the city's residents with greater opportunities for health improvement through expanding its preventive, medical, and environmental programs.

Maternal and Child Health

In the field of maternal and child health, the city led the nation in establishing the first comprehensive maternity and infant services project sponsored with federal and matching funds. The project now provides quality care and guidance to one third of the city's expectant mothers. In 1969, some 5,350 mothers (from a total of 16,196 recorded births) received medical examinations, dental care, nutrition guidance, and assistance with social and delivery problems at the Baltimore Maternity Center at 211 W. Lombard Street, and in district clinics.

Many of Baltimore's health and social problems, and especially those of children, stem from the family's inability to nurture and foster a healthy family unit. In an attempt to correct this, a sizable $400,000 grant was obtained from the U.S. Children's Bureau in 1969 to increase available family planning services in the city. These services are being directed toward planning the kind of family that will give all members opportunities for success and happiness in life—not drudgery and despair as has too often been the case with large and unwanted families in Baltimore.

In the past five years the Maternity Project, which opened in 1965, has provided services to 27,931 maternity patients; 28,000 infants during their first year of life; and 17,685 patients for family planning services. The aim for earlier registration of pregnant women, a most important factor in maternal and infant deaths, is beginning to be a reality. In 1965, only 9% of the patients registered in their first trimester. In 1969, through expanded efforts, 35% to 40% of the patients registered in their first trimester. The number of unregistered patients at Baltimore City Hospitals declined from 70% in 1964 to 13% in 1968, which shows that the efforts to reach the "unreachable" are paying lifesaving dividends in better medical care.

To meet the health needs of children after birth, the City Health Department in 1964 and 1965 conceived a plan to provide free comprehensive services, including dental care, for needy children through age 18. This project materialized into the new Comprehensive Health Services for Children and Youth Projects in cooperation with five Baltimore hospitals. More than 30,000 youngsters and their families now benefit from this health program which provides both preventive and treatment services through funds from the Children's Bureau. In addition, some 30,000 preschoolers each year receive health services in 70 weekly well-baby clinic sessions in neighborhood areas throughout the city. At these sessions, parents receive the latest health information and guidance in child care.

The City Health Department also joined forces

with the Model Cities Agency and is providing iron-enriched milk to 2,000 eligible babies a year. In addition to providing more well-baby clinics, more child day care centers, improved preventive dental care, hearing aids, eyeglasses, and orthopedic devices, the department is offering a wide variety of general health services to Model Cities area residents.

With the help of the Community Action Agency and various neighborhood groups, the health department has made its services available to more and more needy people.

City children and their families have been the beneficiaries of the latest developments in preventive medicine. Successful city-wide vaccination programs have been conducted for the prevention of poliomyelitis, rabies, measles and, more recently in 1969 and 1970, German measles. These are now added to past programs aimed successfully at smallpox, diphtheria, whooping cough, and tetanus.

From the beginning, the goal of the health department has been to closely guard the city's health. Following studies that revealed poor nutrition among the city's poor, the department took immediate steps through the Mayor's Task Force on Nutrition and its own facilities to correct the deficiencies. Schools, city, state, and federal agencies, and a broad spectrum of voluntary groups cooperated in this major effort.

School health services involving the child, the curriculum, and the family are being expanded and modified so that city children will benefit and derive greater opportunities from the educational process. Teacher-nurse conferences, medical checkups, vision and screening tests, and aid to the handicapped through special services, are all a part of this program.

Tuberculosis

Perhaps the most noteworthy achievement in the continuing drive to conquer communicable disease is the dramatic 20% drop in active tuberculosis cases in 1969 compared with the previous year. The gains are the direct result of reinforced preventive and treatment programs involving case-finding, and the administration of new drugs for the treatment and prevention of active tuberculosis.

Chiefly for socioeconomic reasons, Baltimore has had the worst tuberculosis record of any large city in the country for many years. Past attacks have made but slight dents in the problem. However, a change was triggered by a federal report in 1963 by a special Task Force on Tuberculosis Control to the U.S. Surgeon General of the Public Health Service. The report, "The Future of Tuberculosis Control", surveyed the problem nationally and made recommendations. As a result, federal funds were made available for the expansion of local programs along certain specified lines. The city's tuberculosis laboratory was improved until it has become one of the best in the country; furthermore, an experienced tuberculosis controller was appointed in 1965 and the city program came to be recognized as the best in the region.

Other improvements included the following: the number of chest clinics in the city was increased from four to five; the hours in which service was available were increased from 48 to 172 a week; the scope of available drugs was widened; and the type and quality of service was improved so that patient cooperation substantially improved. By mid-1969, the program conformed in all respects to a set of performance standards set up by a representative committee sponsored by the U.S. Public Health Service. The overall results showed that patients could be discharged from hospital to clinic care at an earlier date with the knowledge that they would have continued treatment.

Concurrently, there has been a rapid expansion in the program of drug administration for the prevention of tuberculosis in high-risk individuals, and very recent expansion of this program into industry.

All these changes have had a spectacular effect on the tuberculosis situation. The most outstanding results show reductions of 10% and 20% in the tuberculosis incidence rates in 1968 and 1969, and a currently estimated projected reduction of 20% in 1970. A five-year statistical review has shown, among other changes, the following:

	1965	1969
Number of new cases	**705.0**	**500.0**
New active case rate	**76.8**	**55.1**
Clinic registrants	**27,809.0**	**38,383.0**
Clinic visits	**42,822.0**	**64,742.0**
Patients on drugs		
a) Therapy	**2,244.0**	**3,228.0**
b) Prevention	**516.0**	**3,930.0**
Patients on surveillance	**3,774.0**	**6,313.0**

The great increases in work loads have necessitated staff increases. This need has been principally met by the appointment of paramedical staff from the target areas who have been trained to take over work previously done by professionals.

The cost of the program over the five-year period has increased from $382,000 to $825,000. However, the shift of emphasis from hospital to community chest clinic has resulted in a greatly reduced expenditure for hospital care. This, on a cost effectiveness basis, has resulted in a saving of over $400 in hospital treatment for every $100 invested in outpatient care, with an overall improved efficiency as shown by the reduced rates and definite self-evident advantages to patients.

Mental Health

Taking a close look at the city's mental health needs in 1969, the Commissioner of Health formed

a Mental Health Advisory Council to study the city's programs and to recommend changes.

With additional funds from the State Department of Mental Hygiene through the Maryland Community Mental Health Service Grant for 1970, mental health services for children were expanded in the Eastern and Southeastern health districts. The Southeastern Mental Hygiene Clinic moved to new and larger quarters. The clinic is open daily, Monday through Friday, for treatment and consultative services for children with behavior problems who are referred by parents, schools, or community agencies.

In 1968, the Psychiatric Day Center, first established in 1962 as a community-based mental health facility for the prevention of hospitalization for those with emotional ills, was moved to new quarters at the North Charles Hospital complex. This mental hygiene day center, one of the first of its kind in the country, has become a showplace and training ground for visitors from other localities.

Alcoholism Programs

Alcoholism is now recognized as one of the major public health problems affecting our nation. It is estimated that there are some 80,000 to 100,000 alcoholics in Maryland and that about half of them reside in the Baltimore Metropolitan Area.

For many years, the only resource for the alcoholic was the fellowship of Alcoholics Anonymous and a few physicians who were interested in this disease. However, since 1935 when AA was founded by two recovering alcoholics, Dr. Bob and Mr. Bill W., the public has become more aware of this health problem.

In 1963, the Baltimore City Health Department opened its first clinic for the outpatient treatment of the alcoholic. A psychiatrist interested in alcoholism was appointed medical director of the clinic, which was housed in the Eastern Health District building. In 1965, the first Coordinator of Alcoholism Programs for Baltimore city was appointed to the staff of the Baltimore City Health Department. In 1967, an Alcoholism Center was established in a renovated three-story row house at 2221 St. Paul Street. The new building centralized the City Health Department's alcoholism services.

In addition to outpatient treatment for alcoholism, several other alcoholism programs have been initiated.

1. The Court Counselor program was instituted in May 1967 with one alcoholism counselor assigned to the Municipal Court of Baltimore City, Central District. There are now five such counselors in the Central, Northern, Eastern, Southern, and Northwestern districts. Although the state law was changed in 1968 and public intoxication is no longer a crime, there are still many alcoholics who come before the Municipal Court charged with misdemeanors. The Court Counselors provide consultation to the judges as well as the defendants in these cases.
2. In cooperation with the State Department of Probation and Parole, a Municipal Court Probation Alcoholic Rehabilitation Unit has been in operation since September 1965. This unit is housed in the Alcoholism Center.
3. With grant aid from the National Institute of Mental Health, a training program for alcoholism counselors was established at the health department's Alcoholism Center. Over 60 persons have been graduated from this program since its inception in 1967 and 55 are now employed in the field of alcoholism. The program is recognized nationally and is a needed answer to the problem of trained manpower to work with alcoholics.
4. The Alcoholism Center is an educational facility for the public in general. Seminars, lectures, and in-service training are provided by the staff of the center for professionals such as nurses, social workers, clergy, probation officers, and others who come into contact with the alcoholic. The center serves as the coordinating agency for the various programs that operate in the city and the state for alcoholics.

Geriatric Services

Newest of the health department's programs for the elderly is its Geriatric Evaluation Service. Inaugurated in May 1969, this project seeks to reduce admissions of Baltimore city residents aged 65 and over to state mental hospitals. With headquarters at the Good Samaritan Hospital, the new service is under joint sponsorship of the State Commission on the Aging and the Maryland State Department of Mental Hygiene. Funds for the first project year were made available on February 1, 1969 through Title III of the Older Americans Act and the State Department of Mental Hygiene.

A second program to aid the elderly is that of the Bureau of Special Home Services. This bureau, a delegate agency of the Community Action Agency, was established in the health department in 1968. Its purpose is to assist chronically aged persons of low income to obtain medical, social, and community services. During 1969, a total of 5,000 persons over 60 years old were aided by this bureau through medical-social evaluations and by visits and other assistance by specially trained health aides and volunteers. Services also included transportation and escort services, limited housekeeping assistance, and special social activities including boat rides, baseball games, and Christmas parties. Close cooperation is maintained with the Community Action Agency, the Model Cities Agency, and other official and private groups.

Medical Services

Neighborhood clinics bring needed health department preventive and treatment services close to the people that need them. These include seven prenatal clinics, seven family planning clinics, thirty-seven child health clinics, five immunization clinics, three venereal disease clinics, five tuberculosis clinics, twenty-nine dental clinics for children, and the mental health and alcoholism clinics mentioned above. In addition, some 300 public health nurses make about 80,000 home visits a year to examine newborn babies, to educate parents in child and personal health care, and to assist families with handicapped children.

As voluntary hospitals move out of the city and physicians emigrate to the suburban and county areas, a hard look is being taken at the city's treatment facilities. The City Health Department plans to contribute its energies or its services in meeting personal health care needs of residents. Such planning is underway with Bon Secours, Provident, North Charles General, Mercy, Sinai, and The Johns Hopkins hospitals.

The vital records unit of the department issued 37,370 transcripts of birth records and 74,495 copies of death certificates, while the health information services printed and distributed over 3 million pieces of health literature or other printed matter for department programs or individual and community use.

Sanitary and Environmental Services

A unique environmental health program, perhaps the first in the United States, is the City Health Department's Sanitary Enforcement Program. Begun in January 1969, the new division with a staff of 34 uniformed Sanitary Enforcement Officers maintains surveillance of exterior sanitary conditions in areas outside the inner city area. Within four districts, the enforcement officers visit residents and attempt to secure improvements and compliance with health ordinances and regulations through education. If this fails, enforcement measures are instituted. Since the onset of this program, over 681,000 inspections have been made and significant improvements noted.

Coordinating its efforts with the Sanitary Enforcement Division, the City Rat Eradication Program, a federally funded project, operates in the thickly-settled action area. Health aides, mostly inner city residents, operate from five trailers in strategic inner city locations. With emphasis on education, this program made 260,000 inspections in 1969, and at year's end had 374 city blocks under maintenance. Public Health Service rodent specialists have rated this program the best of its kind in the country. Both the Sanitary Enforcement Program and Rat Eradication Program involve community and neighborhood groups and closely cooperate with the Sanitation Division, the Police Department, the Community Action Agency, Model Cities, and other related city agencies.

The city's air pollution unit has been further reinforced by a $267,000 federal grant. The new funds will provide additional staff and new equipment. An important step forward was the Open Burning Ban Ordinance, made effective in 1968. Under the surveillance of the Bureau of Industrial Hygiene, local industry is making strong efforts to clean Baltimore's air. Moreover, the city is collaborating with county and state units in the designated Baltimore Air Quality Region established in August 1969.

The health department's efforts in the prevention of lead paint poisoning continue unabated. Throughout the sixties, there was a downward trend from 53 cases and four deaths in 1960 to 19 cases and no deaths in 1969. Low point was 1968 with only 13 reported cases.

Another accomplishment of the city's sanitary services is an outstanding record of 14 continuous years of milk production and processing without a single instance of unpasteurized milk offered for sale in the city.

Also noteworthy is the low number of food poisoning outbreaks in the city in recent years. The record shows only two food poisoning outbreaks in 1968 and 1969 involving 13 persons in all. Food control activities include the inspection of 10,000 food establishments in the city including wholesale, retail, manufacturing, and food departments of institutions. In 1969, nearly 250,000 lb of unwholesome food was condemned in the course of protecting the public from food-borne illness.

Medical Assistance Program—Medicaid

Medical services for the poor and medically needy of Baltimore city have always been a concern of city government. These needs of the poor have always been met through joint health and welfare service agencies. However, in 1966, with the establishment of the Maryland Medical Assistance Program, the city's medical care services were placed under state auspices with responsibility for efficient and effective administration, evaluation, and surveillance continued in the health department's Medical Care Services Section.

From 95,000 persons on the medical care rolls in 1965, the program had almost doubled to a total registry of 180,000 residents in 1969. Almost 2,500,000 coordinative efforts and supplies were furnished to both recipients and providers of the services. This figure represents a 20% increase in services with only a 10% increase in staff.

Recognizing the needs of the chronically ill, the health department instituted a new application evaluation service in July 1969 to aid the placement

of patients in nursing homes best suited to the patient's needs. In the first six months, more than 3,000 patients were added by the processing of applications in the Medical Care Services Section.

Camp Concern

As one of the agencies instrumental in the organization and administration of Camp Concern, the City Health Department devoted much time and effort to this summer day camp for disadvantaged youth held at the U.S. Naval Training Center in Bainbridge, Maryland. Close cooperation was maintained with the Department of Recreation in the development and evaluation of the program as well as in the conduct of its many health aspects. Approximately 15,000 youths have now participated in this unique experience which hopefully plays an important part in guiding youth into the channels of constructive citizenship.

Conclusion

The passing years have seen many changes in the City Health Department's efforts to guard the health of Baltimore's citizens. Continued emphasis must be and is being placed on the broad preventive measures. However, as the population and its health status evolves in a changing world of changing directions, the health department will be ready to take whatever steps are necessary, preventive or treatment, in carrying out its charge.

Finally, it should be emphasized that the health department's work could not be accomplished without the support and cooperation of the Medical and Chirurgical Faculty of Maryland, the Baltimore City Medical Society, the Maryland State Department of Health and Mental Hygiene, and the many other agencies, official and nonofficial, who, like the medical profession, are dedicated to improving the health of our citizens.

THE COMMITTEE ON CONTINUING MEDICAL EDUCATION

of the

UNIVERSITY OF MARYLAND SCHOOL OF MEDICINE

offers a

VISITING TRAINEESHIP IN-SERVICE PROGRAM

(1 TO 4 WEEKS)

Various departments and sub-divisions of the University of Maryland School of Medicine are open to interested physicians through a "Visiting Traineeship In-Service Program" designed to expose the practicing physician to the most current concepts in the practice of medicine, surgery and their various specialties.

This program is highly flexible and designed for each enrollee individually. The enrolled physician will participate in the department's routine scheduled program of Rounds, Clinics and Conferences. No alteration in the departmental routine will be made to formalize the program into a specific postgraduate course. The enrollee will, however, be the guest of the division or department with which he affiliates. Ample allowance of time will be made for collateral reading in the privacy of the library and for attendance at Chief of Service Rounds, Resident Rounds and Grand Rounds, if desired.

Each program is individually designed where possible. Such programs are formulated after a personal interview with the Director, or Assistant Director, of the Committee on Continuing Medical Education, and the Department or Division Head under whose supervision the trainee or enrollee will work. However, if a personal interview is inconvenient because of geographical distance, applications will be considered by appropriate correspondence.

Minimum enrollment is one week (5 days). Longer periods may be arranged with the approval of the Chairman of the Committee on Continuing Medical Education and the Head of the department or division involved.

The Visiting Traineeship In-Service Program allows for cross-disciplinary visiting, or the entire period may be allocated to one specific subject or medical problem. This program, therefore, offers a variety of possibilities that may allow a profitable and rewarding experience.

This program of training is not available during June, July, August and September.

Visit to Western Maryland

In an effort to acquaint myself with the librarians and others working in the libraries of Maryland's hospitals, I recently accompanied my husband, Gil Sanford, Associate for Research, Maryland Hospital Association, on an information-gathering trip to several Western Maryland hospitals.

We visited Garrett County Hospital in Oakland, Memorial Hospital and Sacred Heart Hospital in Cumberland, and Washington County Hospital, Western Maryland Hospital, and Brook Lane Psychiatric Center in Hagerstown.

In each hospital, I visited the library to discuss individual situations and problems with the librarian, or secretary, clerk, medical records librarian or any other person designated as librarian. At Brook Lane Psychiatric Center, the library staff included a very enthusiastic volunteer who also works in the Washington County Free Library. In all cases, everyone was anxious to learn how to improve their library collections, quarters, and services. In turn, I was interested in discovering how our interlibrary services could best serve the hospitals and their staffs. We also visited Frostburg State College, since we have a regular interlibrary loan service with them.

Possibly, I learned more about the hospital library situation in Western Maryland than any of those librarians whom I visited learned from me, but I believe that the rapport established between us was certainly beneficial.

* * *

As a reminder—the D. C. Area Medical Library Association meets in Baltimore on Saturday, October 24, 1970. Outstanding speakers will include Dr. Norman L. Stearns of the Postgraduate Medical Institute in Boston, Mrs. Mary Margaret Baxter of the SUNY network in Washington, D.C., and Mrs. Ada M. Lindsey of the Learning Resources Center at the University of Maryland. If you did not receive an announcement with a registration form, contact Miss Hilda Moore, Librarian, Health Sciences Library, University of Maryland, Baltimore, Md. 21201, or Mrs. Elizabeth G. Sanford, Librarian, Medical and Chirurgical Faculty of Maryland, 1211 Cathedral St., Baltimore, Md. 21201. Anyone interested in medical libraries is welcome to attend.

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Alcoholism: Diagnosis

The diagnosis of alcoholism often proves exceedingly difficult for a highly-skilled clinician, or it may be readily apparent to the most disinterested onlooker. Early in its course a high index of suspicion, whenever certain clues appear, will aid the physician in ferreting out additional information on which to base the diagnosis. Not infrequently, the identification will have been made beforehand by the patient's spouse, relative, or associate, who presents accumulated observations and conclusions to the physician for confirmation. It is unwise in any case to prematurely infer that the person is or is not an alcoholic. Rather, one should proceed as methodically as possible toward establishing the diagnosis in the usual manner through careful history, physical examination, and appropriate laboratory studies.

History

Because signs of physical decline are seldom observed before alcoholism is fairly well advanced, early diagnosis and subsequent appraisal of the stage or severity of the illness will depend to a large measure upon accurate historical information. Although there is unavoidable danger in generalizing to describe a "typical" history of the disease, it is apparent that a number of common factors are repeatedly observed. These warrant presentation to demonstrate points which may be critical to proper evaluation of the patient who uses alcohol.

The onset of alcoholism is usually sufficiently insidious and gradual to make it difficult to distinguish the alcoholic from the heavy drinker, although the distinction between the two can also be evident from the beginning. The alcoholic, as compared with the nonalcoholic, has greater emotional response to alcohol and attaches inordinate significance to it, often at the time of the first drink, and then progressively so as the illness develops. One of the earliest signs of alcoholism may be that the use of alcohol precedes, rather than accompanies, a person's having a good time, and that social events become occasions for him to continue to drink, and to excess. Alcohol gradually seems required for real pleasure or enjoyment, and he ensures having enough real pleasure or enjoyment by "fortifying" himself with alcohol before leaving for a party or a comparable function. Alcohol then becomes the goal of social activities, and soon he finds other reasons for using it, such as coping with stress and anxiety. The frequency and degree of his intoxication increase and are at times highly inappropriate to the circumstances. He may become severely intoxicated quite unintentionally, but with greater and greater frequency. He is likely to show irritation and annoyance with those commenting on his intake and associated behavior, especially if they express concern.

In the second major phase of advancement, the alcoholic begins drinking surreptitiously, faster and earlier, and becomes intoxicated regularly. Drinks are gulped down, while more (but less valid) reasons are given for "having a few". Along with his growing preoccupation with alcohol, he starts to feel unmistakable guilt, which leads him to make excuses and to "justify" his drinking. He typically becomes even more defensive about his drinking pattern, and often is openly hostile and angry when it is so much as alluded to. Not infrequently his own concern will have reached the point where he tries to regain control by changing brands or types of beverages, seeking other company, rationing his intake, or limiting his drinking to specific times of the day. He may even "swear off" to prove he can "take it or leave it". Unfortunately, at about this time he may try to

Excerpt from Manual on Alcoholism, *(c) 1968 by the American Medical Association: Reprint permission granted by the American Medical Association, 535 N. Dearborn St., Chicago, Ill. 60610.*

achieve abstinence by substituting other drugs for alcohol such as barbiturates and other sedatives, or amphetamines and other stimulants. These he may take alone or concurrently, or combine them with alcohol.

As the illness progresses, so-called blackouts become a common phenomenon—episodes in which the alcoholic has temporary amnesia for various periods of time during which he has been drinking. These lapses are characteristically followed by feelings of considerable anxiety, concern, and guilt over what may have taken place. There may, however, be little more than mild annoyance at these gaps in memory. Irresponsible or expansive behavior and excessive emotionalism frequently are observed at this time, as the ego-damaging incriminations of others increase the alcoholic's self-doubts. Awareness of physical damage brought on by drinking, as evidenced by the blackouts, for example, may prove a major factor in his efforts to restore himself in his own or others' eyes, often through formulating great plans for the future. These plans seldom materialize, and this in itself contributes to his further emotional deterioration.

Next, the alcoholic loses control over his drinking and frequently drinks to a point of serious intoxication and stupor. Drinking no longer serves its original purposes but now gradually becomes an instrument of destruction. He begins to plan his life around alcohol, taking pains to guarantee a supply, seeking excuses to leave work or escape from others in order to maintain his intake. Supplementation with other drugs often increases. Not uncommonly, he drops old friends or quits employers, perhaps sensing their impending rejection and softening the blows by abandoning them first, replacing them with inferior substitutes. Marital and family problems are compounded, arrests for drunkenness or drunken driving may occur, and social, occupational, mental, and moral disintegration commonly take place as he seeks greater and greater isolation. Tolerance to alcohol is progressively lost, and the more serious physical complications of the disease often begin to predominate over the psychiatric and social ones. Finally, he "reaches bottom".

Physical Examination

Early in the course of the illness, few physical signs are attributed to alcoholism. At the other extreme, the examination probably will focus primarily upon those signs reflecting the complicating ailments and degenerative processes associated with advanced stages. Therefore, it is likely that in most instances the physician will not base a conclusive diagnosis of alcoholism upon physical findings alone. Certain observations, however, will prove substantially helpful in initially arousing his suspicions or perhaps in adding confirmatory evidence to historical facts. Eventually, they will be important in evaluating the degree of advancement or in detecting complications.

It is apparent that the patient who arrives at the office or hospital for examination and treatment with the odor of alcohol on his breath or in a state of intoxication should be suspected of being an alcoholic. The possibility of alcoholism is strongly suggested in the patient who is found to be drinking while hospitalized, as well as in others using alcohol under inappropriate circumstances.

Unusual anxiety, obvious moodiness, shyness, obsequiousness, over-compliance, and passive or overt hostility are by no means exclusive to the alcoholic or necessarily characteristic. Examination, however, may precipitate the appearance of these features and thus reveal the possible presence of serious emotional disturbance, perhaps associated with alcoholism. Other behavior, or aspects of personal appearance incongruous with the patient's background may also be signs of alcoholism.

Unexplained coarse tremor of the hands is often an early clinical manifestation of the illness. Persistent vascular dilatation in the face, especially around the nose, or a palpable but non-tender liver, later suggest physical deterioration associated with excessive intake of alcohol over a period of time.

In the advanced state, one may see multiple fresh and partially healed contusions and abrasions over the extremities, head, and shoulders. The patient frequently is unable or unwilling to explain that these are the result of numerous falls during periods of intoxication. Serious head injury also can occur in this way, and may be seen as the presenting problem.

Some clinicians describe the eventual development of a characteristic "alcoholic facies", with puffiness and deep lines around the eyes, pallor, and vascular engorgement. Malnutrition, associated metabolic and dietary deficiencies, and peripheral neuropathies usually are found late in the course of alcoholism. Finally, the signs of delirium or of a chronic brain syndrome may be observed.

Laboratory Studies

While blood alcohol levels ordinarily will be diagnostic only of the degree of intoxication, other laboratory findings will be helpful in evaluating the alcoholic patient's general physical condition. A number of studies obviously are useful in determining how seriously ill he may be. Others will help define complications and measure their response to treatment.

Even though a person may have been drinking or is possibly alcoholic, stupor or coma can be due to head injury, diabetes, hyperinsulinism, or hemorrhage, or to other drugs. X-rays and other appropriate laboratory procedures are needed to establish the cause and institute proper remedial measures. Electrolyte determinations will help define need for correcting existing imbalances.

SLEEP ZONE

To turn a hospital zone into a sleep zone, you need more than peace and quiet. Your patients need a mattress which gives the right kind of firm, comfortable support. To hospitals across the country, this means the Serta Perfect Sleeper "Hospital" mattress.

It provides restful, healthful sleep, because the patient sleeps **on** it, not in it. And just as important to you, the Serta Perfect Sleeper retains its firmness for years and years of service.

Interested? There's a Serta contract bedding expert near you. Let him help you choose from the comprehensive range of specifications on Serta quality bedding.

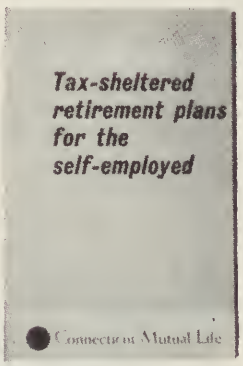
Should You Incorporate?

Maybe Yes.

The present I.R.S. position boils down to this: When you become an employee of your own professional corporation or association, a lot of good things can happen. For one thing, you may cut your income tax. For another, you can beef up your retirement investments with more tax-sheltered dollars.



After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the matter further with your attorney or tax accountant.

Maybe No.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions. And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

Maryland's Mental Hospitals Six Years After Desegregation

Admissions to Maryland's four major mental hospitals were, for the first time, placed on a regional basis in January 1963. The majority of all persons admitted to each of these facilities since that time have been white. However, this desegregation plan did not provide for the transfer of patients already in residence. Since 3,152 (or 38.1%) of those hospitalized at the beginning of 1963 were still under care in the same facility six years later, integration has been gradual and concentrated primarily in short-term active treatment areas. Latest available data (as of December 31, 1968) indicate that 52.6% of all nonwhite patients and 9.6% of all white patients are at Crownsville. Comparable figures for those admitted since January 1963 are 27.1% and 18.9%, respectively.

PERCENT OF NONWHITE PATIENTS IN EACH HOSPITAL

DATE	TOTAL	CROWNS-VILLE	EASTERN SHORE	SPRING-FIELD	SPRING GROVE
DEC. 31, 1962	22.6	100.0	0.0	0.0	0.0
DEC. 31, 1963	23.4	85.9	7.6	6.2	4.5
DEC. 31, 1964	23.9	78.2	10.7	8.9	7.1
DEC. 31, 1965	24.9	73.4	14.9	11.5	8.9
DEC. 31, 1966	25.5	71.0	16.6	13.2	9.9
DEC. 31, 1967	25.6	69.4	18.2	14.3	9.8
DEC. 31, 1968	25.3	65.2	19.7	15.2	14.1

Prior to this policy change, white admissions had, in effect, been on a regional basis (to three hospitals) while nonwhite admissions had been limited to one facility (Crownsville). The revision thus brought mental hospitals considerably closer to nonwhite residents in some areas of the state. As a result, although both the number of white and nonwhite admissions have continued to increase, the latter figure has been rising at a faster pace. Latest available data (for the year ending June 30, 1969) indicate that 30.4% of all patients admitted to the above facilities were nonwhite as compared with the 26.2% reported six years earlier. However, this change has been selective and concentrated among the nonpsychotic. For example, among patients admitted for psychoneurotic and personality disorders, the percent of nonwhite patients increased from 20.8% to 25.8% during this time period. Similarily, while 20.1% of those admitted for alcoholism before desegregation were Negro, this is now 28.7%.

Proportionally, nonwhite state hospital admissions have continued to be twice as frequent as white. In part, this is related to the concentration of nearly half of all Maryland Negroes but less than 10% of the state's white residents in Baltimore's inner core slum areas where rates of most types of treated mental illnesses and of other public health problems are substantially above average. In part, also, this reflects the much greater use of alternative psychiatric services (particularly privately-operated hospitals and private practice) by the white middle class. State hospitals are only one of a variety of psychiatric resources available to the community. Desegregation of these facilities by itself cannot, therefore, necessarily be expected to provide the opportunity for adequate care to meet the needs of all population segments. That is, programs to meet these issues and problems must involve all available resources and services and cannot be limited to state-operated facilities alone.

After the Operation

. . . . do some of your patients suffer from

EMBARRASSMENT?

After a successful operation, you could "lose a patient" from the after-effects of embarrassment—when you find it necessary to press for payment of an overdue bill. To avoid such unpleasant consequences, call in a specialist to treat your patient's wealth as skilfully as you treated his health. The Credit Bureau's collection specialists will solve the problem with tact and efficiency. We'll save your patient embarrassment, and save you money. And if our operation isn't a success, it won't cost you a cent.

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a maximum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

LACTINEX®

LACTINEX®

TABLETS & GRANULES

■ to help restore and stabilize the intestinal flora

■ for fever blisters and canker sores of herpetic origin

Introduced to help reestablish the normal physiology of the intestinal tract in gastrointestinal disturbances[1], particularly diarrheas (including those resulting from antibiotic therapy), Lactinex is also useful for reestablishing the flora following bowel surgery, infant colic, mucous colitis, foul-smelling stools, pruritus ani, flatulence and hives.[2,3,4,5,6]

Lactinex contains a viable mixed culture of both *Lactobacillus acidophilus* and *L. bulgaricus* with the naturally occurring metabolic products produced by these organisms.

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

Corticosteroid therapy week after week.

then antibiotic therapy last week.

and monilial overgrowth this week.

For many patients on long-term corticosteroid therapy, the addition of oral antibiotic therapy may trigger monilial overgrowth in the intestine. When you anticipate such a problem, take action with DECLOSTATIN 300. It combines the broad-spectrum potency of demethylchlortetracycline with the antifungal effectiveness of nystatin—it helps avoid monilial take-over. Experience has shown DECLOSTATIN to be highly useful for many women patients; individual culture studies will show exactly where this usefulness may best be applied.

it doesn't let monilia begin where bacteria end.

Declostatin® 300

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units Capsule-Shaped Tablets Lederle

Effectiveness: Because its antibacterial component is DECLOMYCIN® Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose-related. Transient, reversible, nephrogenic diabetes insipidus with excessive thirst and polyuria (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: One tablet b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

maryland state MEDICAL JOURNAL

VOLUME 19 NOVEMBER 1970 NUMBER 11

CONTENTS:

Editorial—"Singing is Better Than Any Dope" 61

Why People Take Drugs: Escape and Search, Leon Wurmser, MD 62

"In a world that is constantly changing, man is seeking real meaning in life. He may use drugs in a very genuine attempt to cope with the disillusionment and despair that faces him. His quest for real meaning all too often ends in slavish entrapment and a new lie."

Treatment of the Opiate Addict in Maryland: Does the General Hospital Have a Role? Joseph I. Berman, MD 65

"The belief that programs developed by the Drug Abuse Authority provide the best possible care for the addict raises the question of the role of the general hospital in the rehabilitation and treatment of the opiate addict."

Introduction—Drug Abuse: The Dangers and Responses, Russell S. Fisher, MD, Louis J. Kolodner, MD 68

Drug Abuse and the Courts, The Honorable David Ross 70

"There are essentially two ways that drug abusers and drug addicts come before the criminal courts. Addiction itself is not a crime and, under our Federal Constitution, the states are prohibited from making it a crime."

The Addict, Rehabilitation, and the Law, Steven V. Sklar, LLB 72

"Drug abuse is a primary cause of the increase in the crime rate today. It is estimated by statisticians and by judges in the Baltimore area that 50%, if not more, of all crimes committed in the area are motivated by drug addicts in need of funds to support their habits."

Methadone Maintenance Treatment Program, Harvey Gollance, MD 74

"Drug addiction has reached epidemic proportions in New York city and in other sections of the United States as well. An effective treatment for severe heroin addicts known as the Methadone Maintenance Treatment Program has been developed at Rockefeller University and has continued in a greatly expanded program at the Beth Israel Medical Center in New York."

The Communication Gap and the Drug Problem, Neil Solomon, MD, PhD 78

"I am here to make a plea for communication—the kind of communication that should exist between patient and physician, between teacher and student, between parent and child, and between husband and wife, but does not. This lack of real open-door communication leads to drug use."

Panel Discussion—Drug Abuse: "The Dangers and Responses" 80

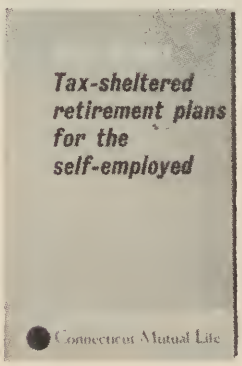
Should You Incorporate?

Maybe Yes. Maybe No.

The present I.R.S. position boils own to this: When you become an em- oyee of your own professional corpo- tion or association, a lot of good things n happen. For one thing, you may cut ur income tax. For another, you can



beef up your retirement investments with more tax-sheltered dollars.

After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the atter further with your attorney or tax countant.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions.

And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet, "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

LEGISLATIVE PROPOSALS

The Council met in special session on Thursday, October 29, 1970, to discuss legislation presently before Congress. Items discussed in the informational session included various proposals for a National Health Insurance System. These proposals include: The Kennedy Proposal, The Griffin Proposal, The Javits Proposal and the AMA's Medicredit Proposal.

LIKELY LAWS

Health Maintenance Organizations and Professional Standards Review Organizations were also discussed at this meeting. These two phrases currently appear in the social security legislation which is now before Congress and which is likely to become law sometime this year.

Health Maintenance Organizations would be given priority with respect to payments under Medicare and Medicaid. Local agencies would be urged to enter into agreements which would provide comprehensive care to patients on the basis of an annual fee. Payments would be based on 95% of the costs of present methods of providing care to such individuals. No HMO would be permitted to have more than 50% of Medicare patients as its participants.

Under the Professional Standards Review Organization setup, the Secretary of HEW would be required to enter into agreements with Medical societies in areas where there are more than 300 physicians. Such societies would be responsible for all peer review activities, and would be required to develop a plan acceptable to HEW in order to become the responsible agency in an area.

If the Secretary did not find such a plan acceptable, or if the local medical society declined to participate, he (the Secretary) would be required to enter into an agreement with any other agency in the area which he deemed suitable.

CLOSED PANEL" MEDICINE

The Council was also informed of various discussions conducted with representatives of the local AFL/CIO. This organization is anxious to promote the "Closed Panel" concept in the practice of medicine.

"CLOSED PANEL" MEDICINE (cont'd)

In a special report, the Council was also advised of present Federal government proposals that would:

Restrict payment for physicians' services under Medicare Part B, on the "basis of a lower percentage of allowable charge" if he (the physician) does not accept assignments under Medicare;

Influence a change in the method of delivering health care by using available funds: first, to pay for health services delivered by prepaid, closed panel programs; second, to pay physicians working under group practice or through cooperative arrangements in a hospital; and lastly, to pay the present fee-for-service arrangement, (providing that funds are left to make such a payment on this basis);

Phase out fee-for-service medicine by establishing local and regional systems, after which a program of National Health Insurance can be implemented. (Presumbly this would be done by placing physicians on a salary basis.)

CHANGES IN MEDICAID PAYMENTS

At a recent meeting with the Governor, initiated by the Secretary of Health and Mental Hygiene, agreement was reached in working towards a goal of payment of Usual, Customary and Reasonable fees for Medicaid services.

The Governor has indicated his desire to increase the services provided medicaid recipients. He is keenly aware of the contributions made by health professionals over the years.

Effective January 1, 1971, payments will be increased to $6.00 for an office visit, $7.00 for a home-day visit; and $8.00 for a home-night visit.

A survey is being made of physicians regarding their current charges to patients for office and home visits so that budgetary figures can be developed for the 1972 fiscal year budget, effective July 1, 1971.

This reflects the continuing high cooperation with the profession by the Secretary's office on health matters.

Achrocidin® Tablets and Syrup

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen Citrate 25 mg.

ACHROCIDIN Tetracycline HCl—Antihistamine—Analgesic Compound Tablets and Syrup are recommended for the treatm of tetracycline-sensitive bacterial infection which may complicate vasomotor rhinitis, sinusitis and other allergic diseases of upper respiratory tract, and for the concomitant symptomatic relief of headache and nasal congestion. For children and eld patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN Tetracycline equivalen Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoli dermatitis; photosensitivity; onycholysis, discoloration. *Kidney*—dose-related ris BUN. *Hypersensitivity reactions*—urtic angioneurotic edema, anaphylaxis. *Intracr* —bulging fontanels in young infants. *Te* yellow-brown staining; enamel hypopl *Blood*—anemia, thrombocytopenic purp neutropenia, eosinophilia. *Liver*—cholestas high dosage.

Upon adverse reaction, stop medication treat appropriately.

Frederick County Medical Society

September Meeting News

"How many doctors would be willing and able to give the time?" "What would be the goals and could they be accomplished?" These were two of the questions asked in response to a proposal from the Community Health Services Committee to establish a steering committee composed of physicians from the society and responsible laymen from the community. The committee gave its report at the business-oriented September meeting of the Frederick County Medical Society.

LeRoy Davis, MD, in the absence of the permanent chairman of the committee, presented the report to the society. In the ensuing discussion, it was suggested that a layman-physician committee, as recommended, could substantially improve public relations. Furthermore, the committee could eliminate much duplication of effort in various "medical-community-organizational" concerns.

Basically, such a committee would involve lay members of the community in finding solutions to problems related to medical services. Such matters as the shortage of physicians, it was noted, are usually blamed upon those physicians who in reality are making the greatest efforts to remedy this problem. It was suggested that by involving lay persons with such problems, a better understanding of the medical profession by the community might be created. Because of the many ramifications of such a committee and the many details to be considered, it was decided to mail a detailed report of the Community Health Services Committee to each member to study, and to consider the recommendations at the next meeting.

A report was given by George Smith, MD, Chairman of the Physician Procurement Committee. He urged the members to be constantly on the alert for students or those in training who might be interested in practicing in Frederick County and to keep his committee posted on their names and addresses.

Charles Wright, MD, reported to the society on the meeting of the House of Delegates, and on the Med-Chi meeting in Hershey.

President A. M. Powell, Jr., MD, announced that with the departure of Thurman Mott, MD, from private practice, there was a need for a psychiatrist in the Day Unit Services of the hospital. President Powell also announced a request for a physician to serve on the local CAC board of directors as well as a request by local law enforcement authorities for a physician willing to serve as physician for the county jail. No immediate action was taken on these requests.

In keeping with its desire to actively assist the Red Cross Blood Donor program, the membership voted unanimously to join in the blood donor program as group volunteers in the name of the society.

The membership welcomed three new active members: Timothy Hickey, MD, associated in general practice with J. R. Poirrer, MD, and W. J. Riddick, MD; Philip Shapiro, MD, internist; and Martin Lipson, MD, ophthalmologist. The hope was expressed that they might enjoy many pleasant years in Frederick County.

Ernest A. Dettbarn, MD
Journal Representative

ART AND HOBBY EXHIBIT

Annual Meeting of the Medical and Chirurgical Faculty

MAY 12, 13, 14, 1971 Baltimore Civic Center

APPLICATION FOR ART AND HOBBY EXHIBIT

Fill in and mail to: Chairman, Art and Hobby Exhibit
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore 21201

1. Title of exhibit: .....

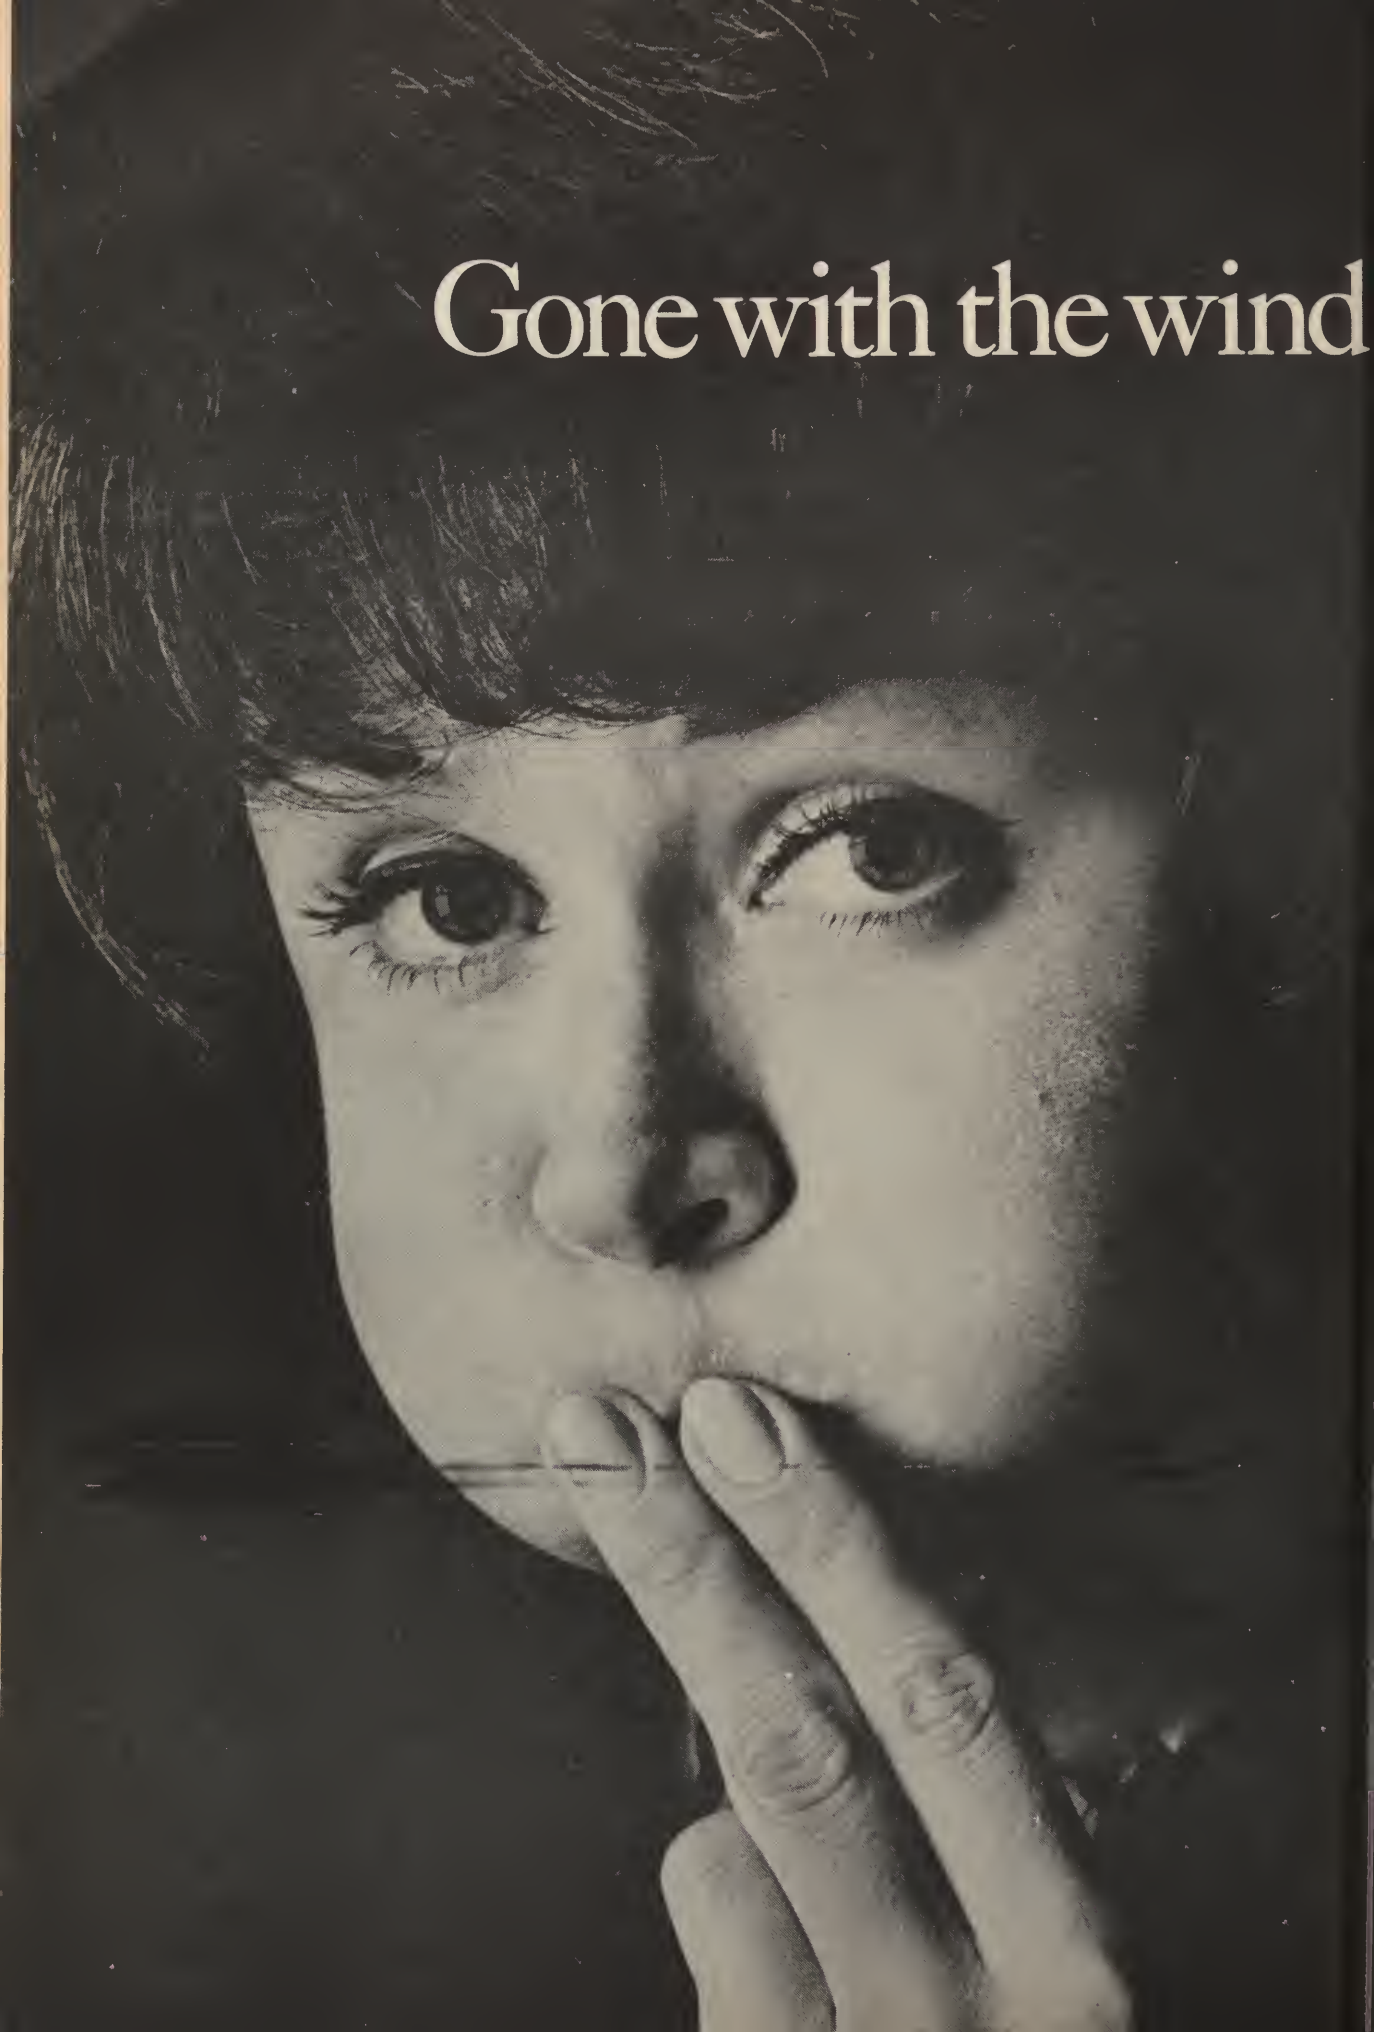
.....

2. Amount of space required—depth, width, and height: .....

3. Electrical or other requirements: .....

4. Name of exhibitor: .....
Please print

5. Address of exhibitor: .....



6. Telephone number of exhibitor: .....

An Art and Hobby Exhibit will be held during the 173rd Annual Meeting of the Medical and Chirurgical Faculty. Physicians, their wives and families are asked to help make this exhibit an outstanding one with many interests on display. Anything made by the exhibitor is eligible and entries will be accepted until all exhibit space is allotted.

Entries should be delivered to the Baltimore Civic Center, Baltimore, between 9:00 AM and 4:30 PM on Tuesday, May 11, 1971. They must be removed on Friday, May 14, between 1:30 and 4:30 PM. The Faculty cannot carry insurance on your exhibit, but utmost care will be taken of it. There will be a watchman on duty when the meeting is not in session. Probably the exhibitors' personal policies will cover the exhibit. All entries should be submitted as early as possible.

A Hobby Corner at the Semiannual Meeting of the Faculty in Hershey created a great deal of interest. LET'S MAKE IT A REAL "SHOW" FOR THE 1971 ANNUAL MEETING. SUBMIT YOUR ENTRIES NOW!

Gone with the wind

The gas/acid group of disorders

"The two most common complaints referable to the upper gastrointestinal tract for which patients seek medical relief are hyperacidity and 'gas.' The two often occur together."*

Frees captured gas...neutralizes free acid

SILAIN-GEL Tablets and Liquid are separate formulas designed to provide equivalent dual-action symptomatic relief. Both dosage forms contain simethicone which effectively frees trapped gas, enabling the patient to eliminate it. Magnesium hydroxide in both assures a rapid rise in pH for prompt relief of hyperacidity. The special co-dried aluminum hydroxide/magnesium carbonate gel in the tablets assures the same rapid and uniform reaction rate as the liquid. Thus, both medications achieve prompt and prolonged neutralization of free acid *plus* prompt relief from the pain and pressure of trapped gas.

Always in good taste

The pleasant, distinctive flavor of SILAIN-GEL, as well as its non-constipating feature, make it a therapy your patients can live with—in comfort and without complaint.

Select the form of SILAIN-GEL you want to provide symptomatic relief in: gastric ulcer • duodenal ulcer • heartburn • gastric hyperacidity • gastritis • dyspepsia

when the patient prefers the convenience of a tablet, select
Silain-Gel® Tablets:

when the patient prefers a liquid, select
Silain-Gel® Liquid

Also available for the patient who needs an antifrothicant/antiflatulent agent only: **Silain®** (simethicone) Tablets

Slanger, A.: Med. Times *94*:150 (Feb.) 1966.

Announcing the "Antgasid"

Silain-Gel®

Tablets: simethicone plus aluminum hydroxide/magnesium carbonate co-dried gel and magnesium hydroxide
Liquid: simethicone plus aluminum hydroxide and magnesium hydroxide

one dose does both: frees captured gas...neutralizes free acid

A·H·ROBINS A.H. Robins Company, Richmond, Virginia 23220

Roche announces

Efudex®

(fluorouracil) cream/solution

for the treatment of solar/actinic keratoses... a topical alternative to conventional therapy

1/22/68—Treatment with 5% 5-FU cream commences. Patient K.L. showing widespread but mild solar keratoses (also known as actinic keratoses).

Fluorouracil—the Roche contribution

In 1962, Roche Laboratories introduced Fluorouracil Roche® (5-fluorouracil). Early clinical work with this drug suggested that it possessed a selective cytotoxic activity when applied topically to certain kinds of lesions. Based on this work and years of clinical trials, a standardized form of topical fluorouracil can now be recommended for treatment of multiple solar or actinic keratoses.

Efudex®(fluorouracil)—a new alternative to conventional therapy

Efudex presents the physician with a topical alternative to surgery in the treatment of solar or actinic keratoses. It is effective, comparatively inexpensive and especially well-suited for treatment of multiple lesions. Important, too, is the highly desirable cosmetic result. Clinical experience demonstrates that treatment with Efudex results in an extremely low incidence of scarring.*

Highly effective on first and later applications

In clinical trials, depending on the dosage form and strength used, complete involution occurred in 77 to 88 per cent of lesions following treatment. The rate of recurrence was low, ranging from 1.7 to 5.6 per cent up to a year after completion of therapy. When lesions did recur or new ones appeared, repeated courses of Efudex therapy proved effective.*

2/68—After 11 days of treatment. ythema is seen at site of keratoses. In dition, numerous lesions not apparent ior to therapy have become manifest sharply defined reactions. Intervening in, also treated, shows no response to erapy.

19/69—One year after cessation of erapy. Skin appears clear with no evi- nce of scarring. Examination reveals k of recurrence or the formation of w lesions.

Predictable sequence of therapeutic response

Two to four weeks constitutes a typical course of Efudex therapy. The response is usually characteristic and predictable. After three or four days of treatment, erythema begins to appear in the area of the keratoses. This is followed by an intense inflammatory response, scaling and occasionally moderate tenderness or pain. The height of the inflammatory reaction generally occurs two weeks after the start of therapy, and then begins to subside as treatment is stopped. Within two weeks of discontinuing medication, the inflammation is usually gone. A mild erythema may remain for two to three months before gradually receding.

Selective—with a high degree of safety

Despite the temporary unsightliness and discomfort of the inflammatory episode, Efudex is, in general, more readily tolerated than surgery. Clinical work shows the intense inflammatory response to be limited to the area of the lesion. Normal skin is not similarly affected. Another measure of Efudex safety: systemic absorption of topical fluorouracil was insignificant, indicating a low risk of systemic toxicity.*

Two strengths—two convenient dosage forms

Efudex is available as a 2% or 5% solution or as a 5% cream. It is applied twice daily by the patient with a nonmetal applicator or suitable glove.

Before prescribing Efudex, however, there are two important considerations. First, please consult the complete prescribing information for precautions, warnings and adverse reactions. Second, advise the patient that treated lesions should respond with the characteristic but transient inflammation. A positive sign that Efudex is working for them.

*Data on file, Hoffmann-La Roche Inc., Nutley, New Jersey.

2% and 5% Solutions; 5% Cream Applied twice daily—resolves solar or actinic keratoses.

new Efudex® (fluorouracil) cream/solution

For full prescribing information, please see the following page.

Roche introduces

Efudex®

(fluorouracil) cream/solution the new standardized topical for solar/actinic keratoses

Description: Efudex solutions and cream are topical preparations containing the fluorinated pyrimidine 5-fluorouracil, an antineoplastic antimetabolite.

Efudex Solution consists of 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris-(hydroxymethyl) aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.

Efudex Cream contains 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

Actions: There is evidence that the metabolism of fluorouracil in the anabolic pathway blocks the methylation reaction of deoxyuridylic acid to thymidylic acid. In this fashion fluorouracil interferes with the synthesis of deoxyribonucleic acid (DNA) and to a lesser extent inhibits the formation of ribonucleic acid (RNA). Since DNA and RNA are essential for cell division and growth, the effect of fluorouracil may be to create a thymine deficiency which provokes unbalanced growth and death of the cell. The effects of DNA and RNA deprivation are most marked on those cells which grow more rapidly and which take up fluorouracil at a more rapid pace. The catabolic metabolism of fluorouracil results in degradative products (*e.g.*, CO_2, urea, α-fluoro-β-alanine) which are inactive.

Studies in man with topical application of ^{14}C-labeled Efudex demonstrated insignificant absorption as measured by ^{14}C content of plasma, urine and respiratory CO_2.

Indications: Efudex is recommended for the topical treatment of multiple actinic or solar keratoses.

Contraindications: Efudex is contraindicated in patients with known hypersensitivity to any of its components.

Warnings: If an occlusive dressing is used, there may be an increase in the incidence of inflammatory reactions in the adjacent normal skin.

Prolonged exposure to ultraviolet rays should be avoided while under treatment with Efudex because the intensity of the reaction may be increased.

Usage in Pregnancy: Safety for use in pregnancy has not been established.

Precautions: If Efudex is applied with the fingers, the hands should be washed immediately afterward. Efudex should be applied with care near the eyes, nose and mouth. To rule out the presence of a frank neoplasm, a biopsy should be made of those areas failing to respond to treatment or recurring after treatment.

Adverse Reactions: The most frequently encountered local reactions were pain, pruritus, hyperpigmentation and burning the site of application. Other local reactions included dermatiti scarring, soreness and tenderness.

Also reported were insomnia, stomatitis, suppuration, scalin swelling, irritability, medicinal taste, photosensitivity and lacrimation.

Laboratory abnormalities reported were leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.

Dosage and Administration: Efudex should be applied twice da with a nonmetal applicator or suitable glove in an amount of t solution or cream sufficient to cover the lesion. When Efudex i applied to a lesion, a response occurs with the following seque erythema, usually followed by vesiculation, erosion, ulceration necrosis and epithelization. The lower frequency and intensity activity in adjacent normal skin indicate a selective cytotoxic property. Medication should be continued until the inflammator reaction reaches the erosion, necrosis and ulceration stage, at which time use of the drug should be terminated. The usual duration of therapy is from 2 to 4 weeks. Complete healing of t lesion may not be evident for 1 to 2 months following cessation Efudex therapy.

How Supplied: Efudex Solution, 10-ml drop dispensers—contai 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris(hydroxymethyl)aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.

Efudex Cream, 25-Gm tubes—containing 5% fluorouracil in vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (meth and propyl).

Clinical Studies: The effectiveness of the three preparations a determined by complete involution of solar keratoses was: 2% Solution, 77% of 282 lesions; 5% Solution, 88% of 202 lesions; and 5% Cream, 85% of 189 lesions. In those lesions wh complete involution followed treatment, the rate of possible recurrences observed clinically at periods up to 12 months or m was: 2% Solution, 4.6% of 218 lesions; 5% Solution, 1.7% of 1 lesions; and 5% Cream, 5.6% of 160 lesions. Because of the toxi potential of fluorouracil, some physicians preferred to use the 2 solution when large areas were to be treated. Approximately 3(of the lesions required treatment for two weeks or less; approximately 78% required four weeks or less for adequate treatment.

Meetings, Activities and Acquisitions

Following my visit to Western Maryland hospital libraries, I visited hospital libraries in Anne Arundel General Hospital, Annapolis; Calvert County Hospital, Prince Frederick; and St. Mary's Hospital, Leonardtown. In Annapolis, Dorothy Mumford was in the process of moving their library sans shelves and other equipment. An integrated medical staff-nursing library collection will be set up in a section of the original building.

At Calvert County Hospital, and also at St. Mary's, the acting librarians, Mrs. Rosemary Poling and Mrs. Katherine Thompson, respectively, both in Medical Records, discussed ways in which the Med-Chi Library can assist them in meeting the needs of their staffs.

* * *

In cooperation with Paul Huffington, MD, of Salisbury, and the Regional Medical Program for Maryland, plans are being made for a series of video tapes illustrating effective use of the existing medical libraries. These tapes will be available to component societies and other interested groups.

* * *

One of the outstanding acquisitions of the past month is *Operative Surgery,* edited by Charles Rob and Rodney Smith, and originally published from 1968 to 1970 by Butterworth, and distributed by J. B. Lippincott in the U.S. Eleven volumes have been published to date, with three more forthcoming.

The library has acquired the following volumes: 1) *General Principles and Breast;* 2) *Thorax;* 3) *Vascular Surgery;* 4-5) *Abdomen and Rectum and Anus;* 6) *Head and Neck and Lymph Nodes;* 7) *Plastic Surgery;* 8-9) *Orthopaedics;* 10) *Eyes and Ear, Nose and Throat;* and 11) *Hand.*

The three other volumes will be: *Genito-urinary System; Gynaecology and Obstetrics;* and *Neurosurgery.*

These texts are well illustrated and each volume is indexed separately. They constitute a major addition to the surgery collection. The individual volumes are authored by renowned specialists in the subject field. Volumes may circulate individually.

* * *

On November 19, 1970, the Baltimore Hospital Librarians' Association will meet at Williams and Wilkins in Baltimore at 1 PM.

On November 19, 1970, the Baltimore Chapter of the Special Libraries will meet at Evergreen House. At this dinner meeting, Miss Elizabeth Baer will speak on the "History of Evergreen House" and Miss Dorothy Miner will discuss "Care of Manuscripts".

On December 8, 1970, the Tri-State Hospital Association will conduct a meeting in Washington, D.C., sponsored by the Baltimore Librarians' Association. For information, contact: Mrs. Lorene Pita, Librarian, Provident Hospital, 1514 Division St., Baltimore, Md., or call 523-4005 (Balto.).

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

May 12, 13, 14, 1971
Baltimore Civic Center

More space is available than in former years. However, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

_____

5. Has exhibit been shown at other medical meetings? _____

_____

6. Name and title of exhibitor: _____

_____

7. Name of institution cooperating in the exhibit: _____

_____

8. Address of exhibitor: _____

_____

The treatment is singular

THE MONTH IN WASHINGTON

The American Medical Association has emphasized that the quality of medical care should not be sacrificed for the sake of economy in government health care programs.

William O. LaMotte Jr., MD, of Wilmington, Del., chairman of the AMA's Council on Legislation, repeatedly stressed the importance of assuring high quality care in testimony at a Senate Finance Committee hearing on proposed changes in medicare and medicaid.

He also pointed out the advantages of the AMA's plan for review of physicians' services aimed at holding down costs over an alternative proposal before the committee. The AMA supported a provision of the proposed legislation that would provide for physical therapy services but opposed including chiropractic services under medicare.

Dr. LaMotte said that there should be pilot projects before a "Health Maintenance Organization" program is started nationwide. A HMO would provide both hospitalization and physicians' services for medicare patients for a set per capita amount.

"There are questions regarding in-fact cost savings, as well as the quality of health care which may be provided when there are economic incentives to providers to reduce utilization," the AMA spokesman said. "We wish to assure that medicare patients uniformly receive the best quality care.

"To this point of quality care, we have one additional concern. As defined in the bill, the HMO may be a 'for-profit' organization and one managed, controlled, and operated by lay individuals. Under such circumstances, the incentive for profit or lack of the basic essentials of knowledge, training, and experience in medical matters, or both, could result in the patient being furnished less than the optimum of quality care. To avoid such a result, we recommend that organizations delivering health care should be under the control and guidance of medical personnel."

Dr. LaMotte also questioned the desirability of a provision that would restrict payments to institutions.

"Will this section create different classes of services based upon the ability or desire of patients to pay for additional services?" Dr. LaMotte asked. "A goal of medicare was to make available to all persons over 65 the same level of health care available to other individuals. Has that goal now been changed?"

He assured the committee that the nation's physicians as a group "share the concern of the public and the Congress" concerning rising health care costs. But, he said, the AMA must oppose a provision that would substitute an arbitrary statutory limitation on physicians' fees for the "reasonable" fee now allowed. He said cost factors were too complex for such a simple solution and that the arbitrary limitation would make the medical profession the only sector of the nation's economy under price or wage controls.

As for utilization or peer review, Dr. LaMotte said the AMA objects "most forcefully" to a provision of the pending legislation that would have nonmedical groups act as review teams and pass judgment on medical services.

Following Dr. LaMotte's testimony, the committee modified somewhat the professional review amendment sponsored by Sen. Wallace F. Bennett of Utah, second-ranking Republican on the committee, after he earlier heard an AMA spokesman advocate the peer review principle.

The modified version relaxed a requirement for preadmission clearance to hospitals for elective surgery to leave the matter of such a requirement up to review agencies. But the committee version would permit the Secretary of Health, Education, and Welfare to enter into agreements with organizations or agencies other than state medical societies for administering the review programs in areas with 300 or more physicians. The AMA strongly contended that the responsible agencies should be only state medical societies.

Meade Whitaker, tax legislative counsel for the Treasury Department, asked the committee to add a provision to the legislation that would require health insurance companies and carriers to report unassigned payments to physicians and other providers of health care. Unassigned payments go directly to patients to be given by them to their physicians. A sim-

ilar proposal was knocked out of last year's tax reform legislation by a House-Senate conference committee.

The AMA—along with the carriers and HEW—have opposed mandatory reporting by carriers of unassigned payments on the grounds that it would be difficult and costly to furnish the data and that, in many instances, the patient might not have passed along the payment to the physician. This last circumstance would put on the physician the unfair burden of proving that he did not receive such income.

Whitaker said that the Internal Revenue Service had found that more than half of 3,000 physicians who received $25,000 or more in government medicare or medicaid payments in 1968 failed to report a substantial amount of their income to the tax agency.

The audits were ordered after the Senate committee raised the question of whether physicians receiving a large total of annual payments under the government medical programs were paying income taxes on all of it.

"Preliminary results indicate a number of instances of substantial unreported income, including some where the omission exceeds $100,000," Whitaker said.

The committee had turned over to the IRS the names of 11,000 physicians who had received medicare or medicaid payments exceeding $25,000 in 1968. Whitaker said that 4,000 of the 11,000 physicians "justified detailed audit" and 3,000 of the audits were nearly complete, and that "about half of the 3,000 we audited will come up with substantial deficiencies" in reported income.

Sen. Russell B. Long (D., La.) said that the investigation had disclosed a "vast area of tax cheating" and urged the IRS to initiate criminal prosecutions against physicians who had hidden their medicare or medicaid income.

Long added that as far as he could see, the AMA, "from the ethical point of view on taxes, has been completely forthright and honorable and sought to shield no one."

Long agreed with the AMA *not* to include chiropractic services in the medicare program. He told a chiropractic spokesman testifying before the committee:

"Insofar as you can convince me that you are doing somebody some good, I would be willing to cooperate, but I am not inclined to cooperate when I am not convinced that you have. My feeling is the only time a chiropractor tried it on me it didn't do any good, so I guess I am prejudiced by that."

* * *

The Nixon Administration came out strongly against the cradle-to-grave comprehensive national health insurance legislation sponsored by Sen. Edward M. Kennedy (D., Mass.) and supported by organized labor leaders.

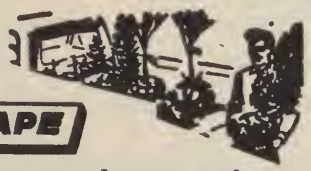
John G. Veneman, Under Secretary of Health, Education, and Welfare, testified before the Senate Committee on Labor and Public Welfare that the program that would be provided by the legislation "is not a proper or workable approach to the solution of the health problems of this nation" and would cost $77 billion in the first year of full operation.

The committee held hearings on the legislation this year only to publicize it and to provide a forum for its supporters to expound their views. The sponsors resorted to a gimmick—a change in the financing provision—to get it before the labor and public welfare panel after it first was sent to the finance committee which ordinarily handles such legislation. The same maneuver was used in 1949 to get a hearing on President Truman's national health insurance proposal. Kennedy and six co-sponsors of his legislation are members of the labor and public welfare committee.

"There are those who insist that the present system is sound and should be left alone," Veneman said. "Others demand that we throw out the baby with the bath water and replace our pluralistic health enterprise with some monolithic scheme in which the federal government controls everything.

"I think both points of view are wrong. The deep troubles of the health care enterprise have been nurtured by many factors, not the least of which is past failure to plan and prepare for the soaring demand that observant people knew was coming. But I do not believe that past neglect means that we now have to start over and pursue some course of action that would be entirely alien to our basic traditions.

"The central issue, over and above the inconceivable commitment of general fund revenues for S. 4323, is whether such a drastic abandonment of existing mechanisms in our health care system is necessary to remedy the defects in the system and whether, in fact, it may not create more problems than it will solve . . .



"Government is currently purchasing more than 36% of the total output of the health care system. This figure indicates that the use of its purchasing power is probably the government's primary source of leverage to initiate changes in the organization and delivery of health care. As government becomes more involved in financing, it also has a greater responsibility to remedy the defects in the system.

"The question now is whether we should divert revenues need-

ed for income maintenance, nutrition, the environment, housing, and other health-related efforts, and concentrate them all on creating the federal system of health financing proposed by S. 4323. To do so would assume the failure of the measures currently proposed to correct defects in the present mixed public-private health system.

"In short, we (the administration) have made substantive recommendations for improving the organization and delivery of services, increasing the efficiency of the health care industry, and for stimulating necessary reorganization and redistribution, through financing mechanisms. We are very much aware of the urgent need for solution of many problems in the financing and delivery of care, and have committed ourselves to an insurance program to provide protection to low income families with children.

"However, we have serious reservations about the desirability of embarking on a program like S. 4323, that will protect not only the unprotected but those with substantial coverage, and that will radically restructure the health financing and health service industry without having tested the instruments of change."

Drip stopped, Congestion cleared

For upper respiratory allergies and infections, up to 12 hours clear breathing on one tablet. Dimetapp Extentabs® do an outstanding job of helping clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely.

INDICATIONS: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, rhinitis, conjunctivitis, and otitis. CONTRAINDICATIONS: Hypersensitivity to antihistamines. Not recommended for use during pregnancy. PRECAUTIONS: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension. SIDE EFFECTS: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered. DOSAGE: 1 Extentab morning and evening. SUPPLIED: Bottles of 100 and 500.

Dimetapp® Extentabs

Dimetane® (brompheniramine maleate), 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.

when an unnerving experience compounds the pain

the compound analgesic that calms instead of caffeinates

In addition to pain, this patient has experienced anxiety, fear, embarrassment, and frustration. No doubt these psychic factors actually increased her perception of pain. Surely the last thing she needs is an analgesic containing caffeine. The logical choice is Phenaphen with Codeine. It provides a quarter grain of phenobarbital to take the nervous "edge" off, so the rest of the formula can control the pain more effectively. It's no accident that the Phenaphen formulations contain a sedative rather than a stimulant. Don't you agree, Doctor, that psychic overlay is an important factor in most of the accident cases you see?

Phenaphen®
with Codeine

Phenaphen with Codeine Nos. 2, 3, or 4 contains: Phenobarbital (¼ gr.), 16.2 mg. (warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg.; Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg.; Codeine phosphate, ¼ gr. (No. 2), ½ gr. (No. 3), or 1 gr. (No. 4) (warning: may be habit forming). **Indications:** Provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products, excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** Phenaphen No. 2 and No. 3—1 or 2 capsules every 3 to 4 hours as needed; Phenaphen No. 4—1 capsule every 3 to 4 hours as needed. For further details see product literature.

Announcement of the **1971 Alfred A. Richman Essay Contest** was made recently by the American College of Chest Physicians. The annual contest offers undergraduate medical students throughout the world the opportunity to submit, in open competition, manuscripts on any phase of the diagnosis and treatment of cardiovascular or pulmonary diseases.

Research or review articles relating to the diagnosis or treatment of cardiovascular or pulmonary diseases are acceptable. In accord with the rules of the contest, preceptors are at liberty to assist the student in selecting a suitable subject and guide him in the preparation of his essay.

Three cash prizes totaling $1,000 are awarded annually. The first prize will be $500; the second will be $300; and the third will be $200. Each winner will also receive a certificate of merit. A trophy inscribed with the name of the winner and the name of his school will be presented to the winner's school.

The winning essayist will be announced by the judges in June 1971.

An official application form may be secured by writing: Essay Contest, American College of Chest Physicians, 112 East Chestnut Street, Chicago, Ill. 60611.

The National Heart and Lung Institute in Bethesda is conducting a one-year survey in the town of Framingham, Massachusetts, to determine the frequency of heart attacks and strokes in a general population.

Called the **Framingham Cardiovascular Disease Survey,** the new study will collect data on all acute heart attacks, strokes, and other serious clinical manifestations of cardiovascular diseases occurring among Framingham inhabitants between June 15, 1970 and July 1, 1971.

The survey will be directed by Manning Feinleib, MD, Chief of the Field Epidemiology Research Section at the National Heart and Lung Institute.

* * *

Taylor Manor Hospital in Ellicott City recently sponsored the **Second Annual Taylor Manor Hospital Psychiatric Symposium** held in the Lord Baltimore Hotel in Baltimore. The symposium was entitled "Discoveries in Biological Psychiatry", and featured distinguished internationally known speakers from the United States and across the world. Each speaker discussed his personal discovery of an important drug and biological therapy important in the care and treatment of the emotionally and mentally ill. The symposium was held April 17-19, 1970.

* * *

The Second Annual Taylor Manor Hospital Psychiatric Symposium held in April 1970 included the following 19 participants (first row, left to right): Harold E. Himwich, MD, Illinois; Tracy Putnam, MD, California; Raymond W. Waggoner, MD, Michigan, President of the American Psychiatric Association; Frank J. Ayd, Jr., MD, Baltimore city, Maryland; Irving J. Taylor, Ellicott City, Maryland; Gerald D. Dorman, MD, New York, President of the American Medical Association; and John F. J. Cade, MD, Australia. Pictured in the second row, left to right, are: Heinz E. Lehmann, MD, Canada; Hugo J. Bein, MD, Switzerland; Lothar B. Kalinowsky, MD, New York; Roland Kuhn, MD, Switzerland; Chauncey D. Leake, PhD, California; Albert Hofmann, PhD, Switzerland; and Joel Elkes, MD, Baltimore city, Maryland. The top row, left to right, includes: Barry Blackwell, MD, Ohio; Pierre Deniker, MD, France; Frank M. Berger, MD, New Jersey; Paul Janssen, MD, Belgium; and Stanley S. B. Gilder, MD, England. Seven other speakers also participated in the symposium but were not available at the time of this photograph.

The cooperation of physicians is requested in the referral of children with **Hand-Schuller-Christian disease** for a study being conducted by the National Institute of Child Health and Human Development's Reproduction Research Branch at the Clinical Center, National Institutes of Health, Bethesda.

Of particular interest for this therapeutically oriented study are children with manifestations of diabetes insipidus, or growth retardation of Hand-Schuller-Christian disease.

Upon completion of their studies, patients will be returned to the care of the referring physician who will receive a summary of findings.

Physicians interested in having their patients considered for admission to these studies should write: Peter Kohler, MD, or Griff T. Ross, MD, Clinical Center, N room 10-B-09, National Institutes of Health, Bethesda, Maryland 20014.

* * *

Martha Schipper, MD, child health consultant at the Frederick County Health Department, recently participated in a round table discussion on "Patient Motivation" held in Missouri.

Dr. Schipper was one of a group of physicians and other authorities from various parts of the country who contributed to this round table discussion. Their comments will serve as the basis for a future feature article in *Patient Care,* a medical journal.

The Division of Maternal and Child Health of the University of California School of Public Health at Berkeley announces postgraduate programs leading to the degree of public health. These programs are for pediatricians, obstetricians, and other physicians interested in receiving training in the field of maternal and child health.

Fellowship support is available, including basic support for the trainee, an allowance for dependents, tuition, and fees.

Applications are now being accepted for the group entering September 1971. For information, write: Helen M. Wallace, MD, School for Public Health, University of California, Berkeley, California 94720.

* * *

Edward L. Suarez-Murias, MD, FAPA, was recently the recipient of the 1970 Wisdom Award of Honor and has been elected to the Wisdom Hall of Fame.

The award cites Dr. Suarez-Murias as being "a distinguished and admirable American of high ideals, real intellectual integrity, and true wisdom".

Dr. Suarez-Murias received his MD degree from The Johns Hopkins University School of Medicine.

Presently, he is a psychiatrist at The Johns Hopkins Hospital and an instructor in psychiatry at The Johns Hopkins University.

* * *

Robert Howard Sauer, MD, of Silver Spring, has been appointed Clinical Director of Clifton T. Perkins State Hospital in Jessup.

* * *

Thomas E. Andreoli, MD, has been appointed Director of the Division of Nephrology, Department of Medicine, at the University of Alabama in Birmingham's School of Medicine.

Prior to this appointment, Dr. Andreoli had held a position at Baltimore City Hospitals.

* * *

W. Glen Moss, MD, has been named Deputy Associate Director for Extramural Research and Training in the National Heart and Lung Institute of the U.S. Department of Health, Education, and Welfare.

Along with his new duties in this newly-created position, Dr. Moss will continue to serve as Chief of the Hypertension and Kidney Diseases Branch.

Dr. Moss and his wife will live in Bethesda.

* * *

The increasing demand of the people of West Baltimore on emergency room facilities of **Lutheran Hospital** has prompted the institution's board of governors to employ several full-time licensed physicians to handle medical and surgical problems of the emergency unit.

Four of the physicians who became affiliated with Lutheran to work in the emergency room are: **Joel Goffman, MD,** formerly of the United States Public Health Service and a native Baltimorean; **Joseph Jack, Jr., MD,** an industrial physician with Bethlehem Steel; **Manuel Tan, MD,** of the Philippines, who has been with Lutheran; and **Jui-Chin Hsu, MD,** who came from Union Hospital in Elkton and is a native of Japan.

* * *

"Diagnosis and Management of Cystic Fibrosis", a 26-minute film, is currently available for free short-term loan to qualified professional groups from the National Medical Audiovisual Center, Station K, Atlanta, Georgia 30324.

* * *

Barry Byer, MD, has been appointed to the post of Health Scientist Administrator in the Training Grants and Award Branch of the National Heart and Lung Institute's Extramural Research and training branch in Bethesda.

In his new post, Dr. Byer will participate in the planning, evaluation, and administration of the Institute's diversified programs of undergraduate and graduate training in the cardiovascular and pulmonary fields.

* * *

A Past President Reports on the Semiannual Meeting

Mrs. Wallace H. Sadowsky

I have been told that there is nothing more passé than a past president. I have found that being passé does have its redeeming qualities though. Take, for example, my trip to Hershey and the Auxiliary's semiannual meeting. With no anxiety and no presidential responsibility, I was really able to enjoy it.

Forty-four women registered for the semiannual business meeting of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland held Friday morning at Hotel Hershey, Hershey, Pennsylvania, September 11, 1970. Mrs. Raymond Yow, president, convened the meeting and Mrs. Robert Reiter, president-elect, recited the state auxiliary pledge.

Greetings from the Medical and Chirurgical Faculty were brought to the assembled physicians' wives by Paul A. Mullan, MD, Chairman of the Public Relations Committee. Dr. Mullan encouraged auxiliary members to assist the Faculty in all-out efforts to increase the enrollment in Maryland's two medical schools. According to Dr. Mullan, "Lack of medical school enrollment is a crisis . . . We should double our enrollment in the next year."

A roll call of officers, board members, and delegates followed. Mrs. William S. Stone reported that the reading committee had approved the minutes of the annual meeting held in April 1970. This was followed by the treasurer's report.

Mrs. Yow reported on her many activities since taking the office of president in April. She has held two meetings of the Executive Board; installed the officers for six component auxiliaries (Washington, Montgomery, Harford, Cecil, Wicomico, and Prince George's Counties); attended three meetings of the Program and Planning Committee of the Med-Chi Faculty; attended out-of-state medical auxiliary meetings in Delaware, New Jersey, and West Virginia; attended the 47th Annual Convention of the Woman's Auxiliary to the AMA in Chicago; attended visual and hearing screenings of three and four year olds in Talbot County; and availed herself of the Public Speaking Seminar at Med-Chi held last spring. Mrs. Yow also was guest at the annual luncheon of the Northampton-Accomack Counties of the Eastern Shore of Virginia held at the Massawadox Hospital, Massawadox, Virginia, in May. In October, she visited the Pennsylvania Medical Auxiliary at its annual meeting in Lancaster, the Fall Conference for presidents and presidents-elect in Chicago, and the Eastern Region Workshops in Philadelphia.

The following Nominating Committee to select a

slate of officers for 1971-72 was elected: Mrs. DeWitt E. DeLawter (Montgomery County), Chairman; Mrs. Thomas Craig (Washington County); Mrs. Allen Moulton (Allegany County); Mrs. Richard E. Lukes (Montgomery County); and Mrs. Robert Ensor (Baltimore County).

Announcement was made that the state-wide goal for auxiliary-raised funds for AMAERF is $6,000, with emphasis on the Student Loan Fund.

The Bylaws were revised by an unanimous vote to enable a physician's wife or widow to join any organized component auxiliary regardless of which county medical society her husband is a member of or may have been affiliated with.

The meeting was adjourned before 11 AM so the ladies could join their husbands in the Castilian Room for the program on "Environmental Pollution". An excellent presentation was given by Joseph A. Mihursky, PhD, Research Associate Professor and Chairman, Department of Environmental Research, Natural Resource Institute, University of Maryland. He spoke on "The Ecology and Condition of the Chesapeake Bay".

Franklin C. Daiber, PhD, Director of Marine Laboratories, and Professor of Biological Sciences at the University of Delaware, described "The Ecology of the Coastal Marshes". Jean J. Schueneman, BSCE, MPH, Chief, Division of Air Quality Control, Maryland State Department of Health and Mental Hygiene, spoke on "Air Pollution: Everybody's Problem".

Friday afternoon's program offered opportunities for many different activities: golfing, browsing in the gift shop, touring the chocolate factory, playing tennis, or even riding in a surrey.

I chose to join the Faculty on its conducted tour of the Milton S. Hershey Medical Center. I had taken the tour last year, but found that more of the building had been completed in the past year and that this year's tour revealed many new interesting facts as well as breathtaking views of modern innovations in hospital planning. The Center has an unique approach. Its concern with "family medicine" is the motivating force in establishing this new school, founded with a $50 million gift from the fortune of the late chocolate tycoon.

George T. Harrell, Jr., MD, is the dean. He designed the school "to educate dream physicians for tomorrow, physicians who will be up-to-the minute scientifically, yet deeply and humanly involved in the health problems of that neglected average American." This philosophy gave rise to Hershey's two greatest innovations: a clinical department of family and community medicine, and an academic department of behavioral science.

Each student is assigned to a family, who is under the regular care of a physician and has at least four members, one or more of whom have chronic illnesses or problems that keep the family close to its physician. For four years the student is on hand for each office visit, house call, or hospital admission involving the family. In this way, he will get to know the family members and to appreciate the continuity of their health problems. Eventually he will help the physician in the family's care.

As we followed our guide through the not-quite-completed hospital, being careful not to trip over boards, wires, and other obstacles of construction, we were amazed at the abundance of facilities planned for the hospital. We were shown ten operating rooms most modernly equipped; a radiology department on each patient-floor; a laboratory on each floor; and a modern kitchen with food carriers and special elevators which will enable everyone in the hospital to be fed within 45 minutes. We also saw motel-like rooms for self-care patients; electronic beds; luxurious lounges for visitors, patients, physicians and hospital personnel; and a Records Library with modern dictating equipment, data processing, and computer systems.

The reception given by the Wicomico County Medical Society around the beautiful fountain in the hotel's lobby followed. How proud Wicomico County physicians must be to have both the president of Med-Chi and the president of the Auxiliary from their midst. This lovely reception was to honor both Henry A. Briele, MD, and Mrs. Raymond M. Yow.

Mark Russell, the well-known humorist and pianist, provided the entertainment Friday night. His bipartisan jingles and political jokes were highlights of this semiannual meeting.

On Saturday morning, we heard U. S. Congressman J. Glenn Beall, Jr., whom the Maryland Medical Political Action Committee had arranged to present an informal discussion on legislation. We were also proud to hear George Finney, MD, give tribute to our Auxiliary member, Marian Mech, for her great contribution to MMPAC.

After Saturday breakfast, many of the women went on the conducted tour of the Hotel Hershey Gardens. Others chose to play tennis, badminton, or miniature golf, to explore the antique shops in the area, or to take the children to the amusement park. Some even chose to join their husbands at their specialty meetings. I enjoyed the panel discussion on "The Malpractice Problem: Insurance Coverage and Suits" at the meeting of the Maryland Chapter of the American College of Surgeons, and even found myself taking notes to pass on to my husband.

On Saturday afternoon, I joined the group taking the bus tour of the community of Hershey. The most outstanding part of the tour to many of us was the visit to Founders Hall, which had just been dedicated the day before. The hub of the Milton

Hershey School, Founders Hall is a complex of buildings comprising administrative offices, a magnificent reception area for visitors, a beautiful chapel and central auditorium, a banquet hall to accommodate 1,600 persons, a closed circuit television studio, and a social center for students, staff, parents, and alumni. Most of the people on tour with us agreed that in all of their travels through foreign lands and in other parts of this country, they had never seen a building so magnificent.

Saturday evening entertainment included a monologue on the Women's Musical Club delivered by Vandy Bauer, MC, and a skit written by Jeanne Sargeant with the musical accompaniment provided by Angela Linhardt. John Graham presented the introductions while Connie Galton, Ethel Biehl, Terry Bromwell, Norma Strobel, Peggy Bagley, Hilary Sargeant, and JoAnn Ptak made up the chorus.

Joseph Harrison, Med-Chi's comptroller, William E. Peterson, MD, E. A. Shimunek, MD, Raymond Yow, MD, Elmer Linhardt, MD, John DeHoff, MD, Talmadge Reeves, MD, Charles O'Donnell, MD, E. C. Mitchell, MD, Aaron Sollod, MD, and Phillip Briscoe, MD, all proved themselves to be hilarious pantomimists.

The reading of letters by Dee Banning and Nancy Reeves, and the delivery of impressions by Dick Bauer (especially that one of Jack Sargeant on the phone) both proved, as did all of the aforementioned entertainment, that amateur entertainment is often the best.

An innovation in this year's semiannual meeting was the Hobby Corner set up near the registration desk. It was interesting to note the many and varied hobbies and talents displayed by our physicians and families. From Allegany County, there were some ceramics, an arrowhead collection, a knit sweater, some beaded work, and a novel display of cooking utensils. Anita Bauer's crocheted afghan, Florence Oster's seascape, and Mary Miltenberger's crocheted dress drew much attention.

From Wicomico County, the Yow family displayed their hobbies of rug-hooking, costume-making, and the assembling of a Heathkit radio. Karen Carney's ceramics and Lilianne Burton's landscapes in water color were only outdone by Dr. Earl Beardsley's petit point and crewel work.

Montgomery County's talents were represented by Monica Ball's seascape and Dr. Carolyn Pincock's pictures with shells.

From Baltimore city there was a display to indicate Polly Reiter's interests in the DAR and the history of medical terminology. Edith Brantigan's collection of books on parliamentary procedure revealed her expertise in this field. Margie Warres' "Gifts from the Sea" was an artistic revelation of her seashore hobby. Attracting the most attention were the many works of E. A. Schimunek, MD, who displayed "Maryland Driftwood"—four pieces, each with an oil-painted scene, attached to an oar. Dr. Schimunek also displayed a duck of leaded glass and two very intricate, realistic paintings entitled "Eula's Hallmarks" and "The Doctor and His Hobbies".

From Harford County there was a beautiful needlepoint handbag made by Marge Garey. And from Prince George's County there were five lovely paintings done by Mrs. William R. Stecher.

Margaret Yow can be proud to have helped steer the 1970 semiannual meeting. But being passé personally helped to make it the most enjoyable meeting I have ever attended. Hotel Hershey was a serene and picturesque setting. The food was a gastronomical delight. The entertainment was lighthearted and gay. The activities were varied and plentiful and the camaraderie was warm. But above all, the educational programs were interesting enough to promote discussion and to make the semiannual meeting more than just another convention.

Health Careers in the Cumberland-Frostburg Areas

Information on health careers in the Cumberland-Frostburg area may be obtained from Elmer Hill, MD, of the Cumberland Health Department, John Moberly at the Memorial Hospital, Sister Mary Louise at the Sacred Heart Hospital, and the guidance counselors at any one of the nine high schools in the area as well as from the Cumberland Public Library.

The splendid laymen's magazine of the AMA, *Today's Health,* is to be found in the library of every high school in the area.

Health Career Clubs are in operation in all nine high schools and are instrumental in helping the student members receive first-hand observational experience from the physicians' offices and laboratories. Each club presents an award for the highest scholastic achievement to the outstanding senior student member of the club.

A series of slides has been made depicting the many avenues in health careers entitled "In Your Own Back Yard." These are available for use in the area.

A meeting was held November 10 to give the president of each Health Career Club an opportunity to learn from representatives of Allegany Community College and Frostburg State College what information is available from each college pertaining to the health field. A question and answer session followed the talks.

MAKE YOUR HOTEL RESERVATIONS NOW AT THE BALTIMORE HILTON

For The

1971 ANNUAL MEETING

Of The

MEDICAL AND CHIRURGICAL FACULTY

MAY 12, 13, 14, 1971

WHEN THE MEETING WILL BE HELD AT THE NEARBY BALTIMORE CIVIC CENTER

A block of rooms has been set aside at the BALTIMORE HILTON for those attending THE ANNUAL MEETING

FOR YOUR HOTEL RESERVATION, DETACH AND MAIL THIS SLIP DIRECTLY TO:

BALTIMORE HILTON HOTEL

In planning high or low calorie diets, Campbell's more than 50 different soups offer you a wide choice. And, most of Campbell's Soups contain a wide variety of ingredients that can serve as supplementary sources of many essential nutrients.

* From "Nutritive Composition of Campbell's Products" which gives values of important nutritive constituents of all Campbell's Products. For your copy, write to Campbell Soup Company, Dept. 536, Camden, New Jersey 08101.

here's a soup for almost every patient and diet ..for every meal and, it's made by Campbell

A fresh choice
in oral contraception
Demulen®
Each tablet contains 1 mg. ethynodiol diacetate/50 mcg. ethinyl estradiol
A distinctive combination containing 1 mg. of ethynodiol diacetate,
Searle's unique progestin with an unmatched record of
acceptance in oral contraception, and 50 mcg. of ethinyl estradiol.
The same low incidence of breakthrough bleeding and of other side effects you have
come to appreciate with ethynodiol diacetate and mestranol plus
all the convenient dosage schedule and packaging features you expect from Searle.
The choice is yours!

A fresh choice in oral contraception

Demulen®

Each tablet contains 1 mg ethynodiol diacetate, 50 mcg ethynyl estradiol

Actions—Demulen acts to prevent ovulation by inhibiting the output of gonadotropins from the pituitary gland. Demulen depresses the output of both the follicle-stimulating hormone (FSH) and the luteinizing hormone (LH).

Special note: Oral contraceptives have been marketed in the United States since 1960. Reported pregnancy rates vary from product to product. The effectiveness of the sequential products appears to be somewhat lower than that of the combination products. Both types provide almost completely effective contraception.

An increased risk of thromboembolic disease associated with the use of hormonal contraceptives has now been shown in studies conducted in both Great Britain and the United States. Other risks, such as those of elevated blood pressure, liver disease and reduced tolerance to carbohydrates, have not been quantitated with precision. Long-term administration of both natural and synthetic estrogens in subprimate animal species in multiples of the human dose increases the frequency of some animal carcinomas. These data cannot be transposed directly to man. The possible carcinogenicity due to the estrogens can be neither affirmed nor refuted at this time. Close clinical surveillance of all women taking oral contraceptives must be continued.

Indication—Demulen is indicated for oral contraception.

Contraindications—Patients with thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia and undiagnosed abnormal genital bleeding.

Warnings—The physician should be alert to the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism and retinal thrombosis). Should any of these occur or be suspected the drug should be discontinued immediately.

Retrospective studies of morbidity and mortality in Great Britain and studies of morbidity in the United States have shown a statistically significant association between thrombophlebitis, pulmonary embolism, and cerebral thrombosis and embolism and the use of oral contraceptives.There have been three principal studies in Britain[1-3] leading to this conclusion, and one[4] in this country. The estimate of the relative risk of thromboembolism in the study by Vessey and Doll[3] was about sevenfold, while Sartwell and associates[4] in the United States found a relative risk of 4.4, meaning that the users are several times as likely to undergo thromboembolic disease without evident cause as nonusers. The American study also indicated that the risk did not persist after discontinuation of administration, and that it was not enhanced by long-continued administration. The American study was not designed to evaluate a difference between products. However, the study suggested that there might be an increased risk of thromboembolic disease in users of sequential products. This risk cannot be quantitated, and further studies to confirm this finding are desirable.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions medication should be withdrawn.

Since the safety of Demulen in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the time of the first missed period.

A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant cannot be determined at this time.

Precautions—The pretreatment and periodic physical examinations should include special reference to the breasts and pelvic organs, including a Papanicolaou smear, since estrogens have been known to produce tumors, some of them malignant, in five species of subprimate animals. Endocrine and possibly liver function tests may be affected by treatment with Demulen. Therefore, if such tests are abnormal in a patient taking Demulen, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of progestogen-estrogen preparations preexisting uterine fibromyomas may increase in size. Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. In breakthrough bleeding, and in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In undiagnosed bleeding per vaginam adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged Demulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Demulen therapy. The age of the patient constitutes no absolute limiting factor, although treatment with Demulen may mask the onset of the climacteric. The pathologist should be advised of Demulen therapy when relevant specimens are submitted. Susceptible women may experience an increase in blood pressure following administration of contraceptive steroids.

Adverse reactions observed in patients receiving oral contraceptives—A statistically significant association has been demonstrated between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism and cerebral thrombosis.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions; neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals and mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption and itching.

The following laboratory results may be altered by the use of oral contraceptives: hepatic function: increased sulfobromophthalein retention and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test and pregnanediol determination.

Baltimore County Medical Association

The members of the Baltimore County Medical Association enjoyed an "Afternoon at the Races" on Wednesday, August 26, 1970, at the Timonium Racetrack in Baltimore County. After a luncheon in the Challadon Room, the members adjourned to the reserved section of the grandstand to watch the races.

A beautiful trophy was presented to the owner of the winning horse in the eighth race by Wilmer K. Gallager, Jr., MD, president of the association.

According to J. Morris Reese, MD, chairman of the board of Timonium Racetrack, this is the first time that such an event has taken place.

Whether the members of the association won or lost, they all seemed to have a wonderful time and are looking forward to making this an annual affair.

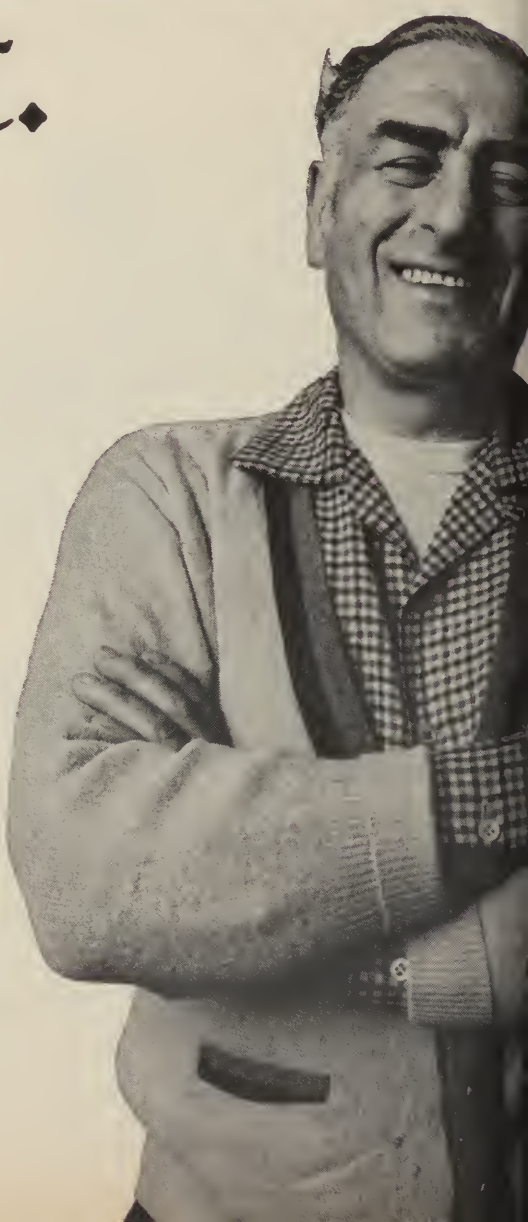
September Meeting

Eighty members and guests were present at the September meeting of the Baltimore County Medical Association at Duffy's Restaurant.

Wilmer Gallager, Jr., MD, president of the association, presided at the meeting. The minutes of the previous meeting were approved and the treasurer, Herbert Levickas, MD, reported that the treasury was "in the black."

The Chairman of the Board of Governors, Theodore Patterson, MD, stated that the board approved the moving of the association offices to Sheppard Pratt Hospital at the expiration of our present lease.

John Krager, MD, vice-president, announced the dates and locations of the October and November meetings.

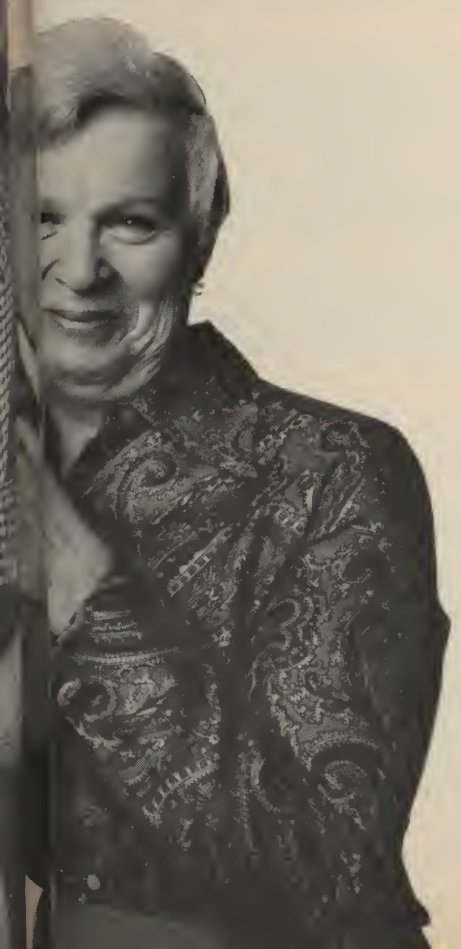


Ten new members were approved by unanimous vote. There being no further business, the meeting was adjourned.

B. B. Velez, MD, FACS
Chairman, Public Relations

Wilmer K. Gallager, Jr., MD, president of the Baltimore County Medical Association, presents a plate to Louis Kapelski, owner of the thoroughbred, Ruling Maxs, winner of the first Baltimore County Medical Association Purse on August 26, 1970 at Timonium. Jockey Danny Wright, standing between Dr. Gallager and Mr. Kapelski, rode Ruling Maxs to victory over the five and three quarter furlong distance in one minute, eleven and one fifth seconds. The lower portion of the picture shows Ruling Maxs nosing out Arm's Length, who came in second, and Plix, who took third place.

Menrium® treats the menopausal symptoms that bother him most.



Roche
LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

His wife has a lot of different menopausal symptoms, but only a few really irritate *him*. Her hot flashes, her vertigo, her palpitations—that's *her* problem. What really bothers him is her nervousness, her irritability and her excessive anxiety, often expressed by endless "book-shuffling, chain-smoking, reading-lamp" insomnia!

Menrium takes care of hot flashes, vertigo, palpitations in most menopausal women. Menrium provides the well-known antianxiety action of chlordiazepoxide (Librium®) and water-soluble esterified estrogens. It therefore relieves more symptoms than either component separately. It takes care of the vasomotor symptoms as well as the emotional symptoms. This means the symptoms that bother his wife most. And the symptoms that irritate him most.

So, to help them both get through the menopause, remember Menrium.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of manifestations generally associated with the menopausal syndrome—anxiety and tension, vasomotor complaints and hormonal deficiency states.

Contraindications: Women with cancer of breast or genitalia, except inoperable cases, and those with known hypersensitivity to chlordiazepoxide and/or esterified estrogens.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Exclude other possible causes of menopausal syndrome manifestations, such as pregnancy. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) similar to those seen with barbiturates have been reported following discontinuance of chlordiazepoxide HCl. Potential benefits of use in pregnancy, lactation or women of childbearing age should be weighed against possible hazards to mother and child. Clinical data inadequate on safety in pregnancy.

Precautions: In elderly and debilitated patients, limit dosage to smallest effective amount of chlordiazepoxide (initially 10 mg or less per day) to preclude ataxia or oversedation; increase gradually as needed and tolerated. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects—particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in patients with impaired renal or hepatic function. Paradoxical reactions to chlordiazepoxide (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients. Employ usual precautions in the treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation very rarely reported in patients receiving Librium® (chlordiazepoxide) and oral anticoagulants.

Adverse Reactions: Untoward effects seen with either compound alone may occur with Menrium. With chlordiazepoxide, drowsiness, ataxia and confusion reported in some patients, particularly in the elderly and debilitated; while usually avoided by proper dosage adjustment, these are occasionally observed at lower dosage ranges. Also reported have been a few instances of syncope; isolated occurrences of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido, and occasional reports of blood dyscrasias, including agranulocytosis, jaundice and hepatic dysfunction. Periodic blood counts and liver function tests advisable during protracted treatment. Changes in EEG patterns (low-voltage fast activity) observed during and after chlordiazepoxide treatment.

With estrogens, headache, nausea and vomiting, anorexia, gastrointestinal discomfort, dysuria and urinary frequency, jitteriness, breast engorgement, formation of breast cysts, skin rashes and pruritus occasionally seen. Administration may also be associated with uterine bleeding and/or followed by withdrawal bleeding.

Usual Dosage: One tablet t.i.d. for 21 days, followed by one-week rest periods.

Menrium® T.I.D.

5 mg chlordiazepoxide	5-2	0.2 mg water-soluble esterified estrogens
5 mg chlordiazepoxide	5-4	0.4 mg water-soluble esterified estrogens
10 mg chlordiazepoxide	10-4	0.4 mg water-soluble esterified estrogens

For Safe, Sure, Speedy Relief —
— Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, Resinol Greaseless Cream was developed. . . . A doctor's formula containing safe yet powerful ingredients, Resinol Greaseless contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try Resinol Greaseless . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

Fast...long-lasting relief of aches and pains of colds and flu

with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 6,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

What the doctors in this country need is a simple, accurate lab system for under $600.

That's why we invented the UNITEST SYSTEM.

hysicians can't operate their offices
ke doctors did in the old days.
That's when the patient load was
wer and so was the overhead, in
ase you wanted to have lab tests
erformed right on the premises.
here were a lot more qualified tech-
cians for hire, too. Or if you didn't
ant the bother and payroll of a big-
er staff, you sent specimens out to
ocal lab or a nearby hospital. Then
u waited for results to return and
lded the charge to the bill.
Problem is, that way isn't econom-
ally feasible any longer. More so-
isticated lab tests have been de-
loped to aid your diagnosis. Fewer
illed personnel are available. The
mplex equipment required is more
pensive. And the cost of space is
emium.
Somebody had to solve this king-
ed problem. We did.

Bio-Dynamics, Inc.
The Simplifiers
9115 Hague Road
Indianapolis, Indiana 46250

We perfected the compact UNITEST SYSTEM. You start with the heart and brains, the Unimeter. It sells for below $600. Far below, in fact. Then, you add-on components you don't already own. When you're done, any qualified person in your office can run 14 tests for the most commonly-needed determinations. That includes Blood Glucose, Hemoglobin, B.U.N., Uric Acid and Cholesterol.

And you get accurate test results faster, often before the patient leaves.

Yes, the compact UNITEST SYSTEM is a lot smaller than you'd expect for equipment that does so much. And there are so many functions it does so well, you really owe it to yourself to get more information. Some is on the following page. The card below will bring you all of it. Just complete, detach and mail.

Gentlemen:

I am interested in receiving more information about use of the UNITEST SYSTEM in my office.

Name _____

Address _____

City _____ State _____ Zip _____

Phone No. _____

The UNITEST SYSTEM provides these important features:

The Unimeter—The Unimeter 250 is a precisely-calibrated, solid state colorimeter. Rugged in design and simple to operate, it has only three controls: on-off switch, calibration control dial and temperature control button.

The Select-a-Fuge 24 — The most advanced centrifuge in its category ever developed . . . a single unit capable of performing *three* centrifugated preparations where at least two units were previously required . . . and in the shortest possible time for each specimen involved. The Select-a-Fuge 24 can prepare urine specimens at the low speed of 4000 rpm . . . or perform uniformly consistent serum, plasma and hematocrit results at 10,000 rpm. Other preparations requiring graduating intermediate speeds may also be conducted. Select-a-Fuge 24 does all this without changing equipment, without adding or removing parts.

Built-in Incubator — The Unimeter has a convenient built-in incubator which holds twelve tubes at a constant temperature of 37°C. There is an instant push-button temperature check.

Interchangeable Meter Faces—The slip-in meter face cards with color-coded test scales allow the operator to adapt this unit to a variety of tests and to incorporate any new tests which may be added in the future.

Push Button Pipetting—Automatic Pipette controls critical measurements precisely with remarkable ease and speed. Assures dependable results between operators, regardless of their individual skills.

Unitube—The optically correct, glass Unitube contains reagent materials. It also contains the reaction and is used as a cuvette, when the reaction is complete. After the result is recorded the Unitube is discarded. Unitube caps are color-coded for each test.

Unitest Kits — Each kit contains everything necessary to perform the tests. Everything is pre-measured, color-coded, sealed against contamination and disposable. Simple, step-by-step illustrated instructions are enclosed in every kit. Kits are available in a variety of sizes.

1971 ANNUAL MEETING

Medical and Chirurgical Faculty of the State of Maryland

MAY 12, 13, 14

A program presenting what's new in medicine in a new location

BALTIMORE CIVIC CENTER

NEW DIMENSIONS IN MEDICINE

Among the prominent speakers scheduled to present papers during the Annual Meeting are:

Alan F. Guttmacher, MD
President
Planned Parenthood World Population

Saul Krugman, MD
Professor and Chairman
Department of Pediatrics
New York University School of Medicine

Nicholas J. Pisacano, MD
Secretary
American Board of Family Practice, Inc.

Edward C. Rosenow, Jr., MD
Executive Director
American College of Physicians

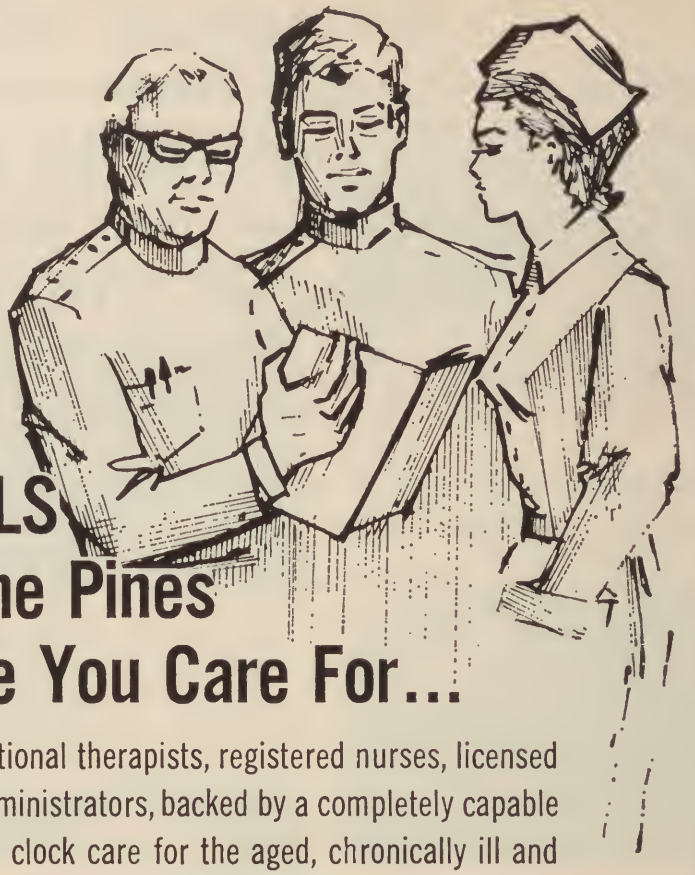
G. Rainey Williams, MD
Professor of Surgery and Chairman
Department of Surgery
University of Oklahoma School of Medicine

Neil L. Chayet, Esquire
Boston, Massachusetts

There will be medical and surgical **Pediatric Grand Rounds** and a session on **Medicine and Religion.**

Scientific and Technical Exhibits will be on display at the Civic Center. *Something new can be learned at every exhibit.* Intermissions are being scheduled so that physicians can visit the exhibits —take advantage of this opportunity.

Other activities scheduled are:



ROUND TABLE LUNCHEON—Baltimore Civic Center
HOSPITALITY NIGHT—Baltimore Hilton Hotel
PRESIDENTIAL RECEPTION AND BANQUET—Blue Crest North
A dinner-dance with Rivers Chambers Orchestra
ART AND HOBBY EXHIBIT—Baltimore Civic Center
HEALTH EVALUATION TESTS—Baltimore Civic Center

An application form for the **Scientific Exhibits** can be found on page 28 of this Journal; a form for the **Art and Hobby Exhibit** is on page 19. Send yours in today!

Further information will appear in future issues of the Journal.

MARK THESE DATES ON YOUR CALENDAR NOW
MAY 12, 13, 14, 1971

THESE PROFESSIONALS at House In The Pines Care for Those You Care For...

Staff physical and occupational therapists, registered nurses, licensed dieticians, experienced administrators, backed by a completely capable staff, perform around the clock care for the aged, chronically ill and convalescent. A social service worker is also part of our Belvedere staff.

- COMPLETE CARE PROGRAM
- Around the clock professional nursing care.
- Physical and occupational therapy.
- Recreational facilities and programs.
- Well balanced, tasty meals . . . and special diets.
- Safe, fire-proof construction.
- Cheerful, home-like surroundings.

"Singing is Better Than Any Dope"

Janis Joplin, Jimi Hendrix, and Diane Linkletter. What did these three people have in common? And anyway, you are probably asking, who were they?

In answer to the first question, these three people had death by drugs in common. Each ended his own life by taking drugs. Each was under 30 years of age.

Janis Joplin sang the blues. At age 27, she had inscribed a name for herself in the hearts of young fans who "dig soul". While she declared, "Singing is better than any dope", still she died of an overdose of heroin only last month.

Three weeks before her death, Jimi Hendrix, also 27, died. This original blues guitarist suffered a more ignoble death. He choked on his own vomit after taking nine sleeping pills. At the much-publicized Woodstock Festival held in the summer of 1969, he delivered a surrealistic, anguished version of the "Star Spangled Banner", that still elicits praise from blues fans and critics alike.

Diane Linkletter was the youngest daughter of Art Linkletter, a show business veteran of 35 years. She, too, took her own life in a mood of irrationality, panic, and despair that was the aftermath of a bad LSD trip.

Each of these young people were successful, yet each developed a reliance on narcotics as a way of life—and death.

But, why should they have developed this reliance? Why should anyone?

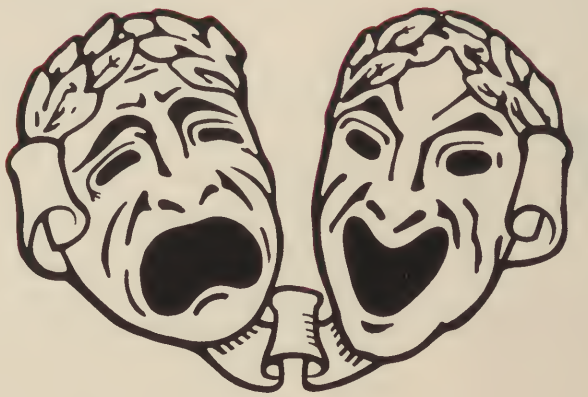
Certainly, we live in a highly complex and pressure-filled society. Just as these three young people mentioned above felt themselves under pressure for individual reasons, students are also under pressure to get good grades. Housewives are under pressure to successfully manage family, home, and job. Executives are under pressure to "close the big deal". Truck drivers are under pressure to stay awake. GI's are under pressure to accept discipline. Everyone is pressured nowadays to have, to do, or to be.

To ease the pressure, or else to stimulate a response to it, marijuana is puffed, pills are dropped, and heroin is mainlined.

In this issue of the *Journal,* many possible answers are supplied to solve the drug problem. Harvey Gollance, MD, explains his Methadone Maintenance Program. Delegate Sklar and Judge Ross call for stricter law enforcement. Mr. Lichtman, a former drug user, explains his mainlining experiences. And Neil Solomon, MD, PhD, calls for communication through education as a way of undermining the drug problem.

From all of these excellent articles, Dr. Solomon's emerges as the one that deserves special comment. The others emphasize the rehabilitative aspects of the problem. Dr. Solomon's stresses the preventive aspect.

Communication through education seems a simple formula to this complex problem, and the most sensible one offered to date.



Perhaps if students, housewives, executives, truck drivers, GI's, and society members in general could learn about drugs, they could better compare the extent of their pressures to the risks of taking drugs. Logically, after weighing their pressures against the effects of the drugs, these individuals would choose to shun the drug subculture. For example, they could communicate to others the uselessness of taking drugs in solving any problems, just as Dr. Solomon suggests.

Perhaps, too, if a program of two-way communication through community education is developed, the future Janis Joplins of this world would say that, "Singing is better than any dope", and mean it.

CKW

In a world that is constantly changing, man is seeking real meaning in life. However, he has always looked for ways to escape from the frustration and disillusionment that faces him. He may use drugs in a very genuine attempt to cope with this disillusionment and despair. But, by using drugs, he is merely fleeing from one type of commitment, often recognized as false and built on deception and steeped in constraint, into another type of commitment. This new commitment appears to be a new freedom, but it may often end in a new slavish entrapment and a new lie. His quest for real meaning all too often ends in a new, even more pervasive illusion.

Why People Take Drugs: Escape and Search

LEON WURMSER, MD
Assistant Professor, Director
Drug Abuse Center
Johns Hopkins Hospital
Baltimore

Throughout history, man has always attempted to escape from the intolerable and seek that which he wants and dreams of. One means of bridging this gap between frustration and fantasy was magical rituals. Delusions in the form of individual or shared mythologies were another. Drugs were a third ancient form of transcending the limitations of disappointing reality and of reestablishing the shattered illusions. This transcending was proclaimed as a trip towards the true reality, the "beyond", which left the limited, sober, alienated presence behind.

Drugs in History and Literature

Kannabis, a Greek word of Iranian origin, is related to the Greek word konabos (noise) which refers to the ecstatic behavior induced by marijuana, and described by Herodotus in celebrations of the Scythians.

Opium was known to the Sumerians as a plant of joy. Wine, beer, and mead were used by the Europeans; peyote and psilocybin by the American Indians; soma by the Aryans at the time of the Vedas; and the mushroom *Amanita muscaria* by the Siberian shamans. These were all means to lead the user to a state of ecstasy or forgetting, and to what the Greeks called "enthusiasmos"—being filled by a godly force. Even Socrates said, "Our greatest blessings come to us by way of madness," (*Phaedrus*, 244A), although certainly he did not think of the use of drugs to bring about this inspired state.

We find two references to the use of a tranquilizer and a narcotic in Homer's *Odyssey*. In book IV (220 ff), Helen "drugged the wine with an herb that overcomes all grief (nepenthes) and anger and lets

forget everything bad. Whoever drinks wine thus drugged cannot shed a single tear all the rest of the day, not even when his father as well as his mother die, or when he sees his brother or son hewn in pieces before his eyes." In book IX (90 ff), Homer writes about the landing on the island of the lotus eaters and the effect of the fruit of the lotus tree, "which was so delicious that those who ate of it left off caring about home, and did not even want to go back and say what happened to them." Tennyson (*The Lotus Eaters*) asks:

"Why are we weigh'd upon with heaviness,
And utterly consumed with sharp distress.
While all things else have rest from weariness?
All things have rest: why should we toil alone,
We only toil, who are the first of things,
And make perpetual moan,
Still from one sorrow to another thrown . . ."

And he answers:

"We have had enough of action, and of motion we . . .

Let us swear an oath, and keep it with an equal mind,
In the hollow Lotus-land to live and lie reclined
On the hills like Gods together, careless of mankind . . .

Surely, surely, slumber is more sweet than toil, the shore
Than labor in the deep mid-ocean, wind and wave and oar;
O, rest ye, brother mariners, we will not wander more."

Question and answer, the escape from toil and the quest for peace: we see in this poem the two poles of the one experience—the flight from something unacceptable towards something better.

Underlying Reasons for Using Drugs

If we try to answer the question: "Why do people take drugs?" we can say that they either want to escape from or to fight against something, or else they want to search for something else, something new and better. All drug abuse can be explained by this general law of escape and quest, though the emphasis may vary.

If we ask our patients what they flee from, they tell us in descending frequency: boredom and a sense of meaninglessness; a lack of identity and a sense of not belonging; anger and guilt; a sense of worthlessness; emptiness and shame; and general frustration and tension. What is sought are the opposites: meaning and satisfaction of "curiosity"; a sense of self and of belonging; quiet and peace; a sense of worth and richness; and relief and pleasure.

Thus, it is clear that the use of any mind-altering drug is a symptom of an underlying problem, and not the problem in and by itself. Too little is being done in an attempt to understand the underlying causes of drug abuse and to treat its consequences. Drug abuse is viewed as if it were enucleated from its causes and its effects. It is made into a demon and is attacked with a moral indignation which leaves the fighter tired, but guilt-free and with a sense of power.

Of course, reality is far more complex. I have divided the underlying polarity of escape and quest into four dimensions: 1) the individual and his inner conflicts; 2) the family background; 3) the social condition; and 4) the philosophical value problem involved.

The Individual's Inner Conflicts

I believe that there are three particular conflicts which are especially relevant to understanding and treating the individual drug user. The first concerns the formation of conscience and ideals. If we are confused about responsibility, integrity, and commitment, if we see a profound abyss between that which we demand and expect from ourselves and that which we really are, we try to bridge this gap. In place of the disillusionment with ourselves, we reestablish, through the use of drugs, the illusion that we are happy, great, rich, all-powerful, magically perceptive, and blessed.

The second conflict is peculiarly modern. Instead of developing an active attitude towards the world, we develop a particularly passive, receptive attitude which conflicts with the extremely active mobile style of life expected of modern man. I strongly suspect that there is a correlation between the dependency upon the TV during the formative years of childhood, and the peculiarly demanding, gaping attitude which leads many youngsters into drug dependence.

The third conflict is not specific for the present. The wish to be magically omnipotent, and the realization that one cannot be, are polar to each other. Drugs wipe out bad reality just as the wand of the magician does.

Family Background

All children have to outgrow their parents, have to break away from their family, and have to go through the often painful process of disillusionment. This is what adolescence is all about. Today's preferred way of carrying out this break is through drugs—if they are available and if the social setting is conducive to it. If we look more closely at the relationship with the family, we recognize the same loss of commitment and authority within the family as we just encountered within the individual. Beyond this we often find a very profound disillusionment and distrust.

Perhaps I am mistaken, but I believe that this disillusionment is much more pervasive today than in the past. I suppose this is so because of the split between the enormous technological power on the one

side and the emotional dearth, the scarcity of ideas, and perhaps most centrally, the lack of integrity of the adult world on the other. We adults resemble the giant in Nebuchadnezzar's dream. We are world shaking, but with clay feet. Each one of us has access to the magical wonders mankind has been dreaming about for millennia. Yet many of us have not grown far beyond the temper tantrums and dependencies, the arrogance and vindictiveness, the self-aggrandizement and the power hunger of the toddler years.

Within a particular group, the target of the youngster's rebellion may be the lack of responsibility at home and the possessive attitude of his parents. As one youngster in our program told Dr. Berman: "Look, I don't blame anything on my parents or on any of the parents because they are doing it unknowingly. They are doing it out of love and the feeling that they are doing the best thing. But the kids want to get out on their own, but they (the parents) don't want the kids to go out on their own. They want him to stay at home and they want to support him until he is 21. A lot of people I know just aren't interested in doing anything because they have everything, like when you have a car and you have everything you don't have to work for anything. . . ."

Other adolescents rebel against the unreasonable but frequent alternation of parental rage and nagging with a spoiling and indulgent chumminess. They protest by doing that which they know would elicit the most attention from their self-centered parents —using drugs.

In another group of adolescents—perhaps the most frequent group—a nice, basically healthy adolescent teases himself and his conforming, perhaps rigid parents by experimenting with drugs. He tries to test whether the precepts of his parents should be believed, or whether his peers were right after all. The dreary thing is that most communication about drugs from the older generation is such a huge lie that the parents cannot be trusted anymore, once the youngster has found this out.

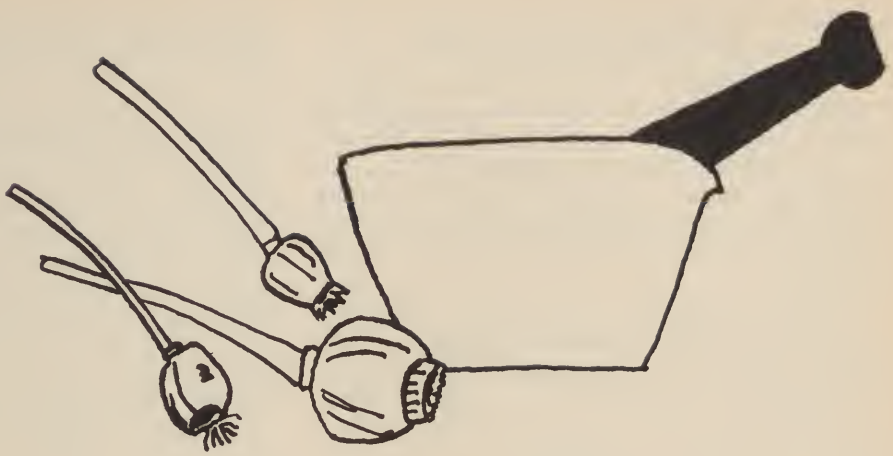
Still others say that they seek their own identity and integrity against the dishonesty and the lack of openness and trust at home by using drugs. If the parents are away all the time seeking status and success, the child seeks a new integrity in a life style which is diametrically opposed to that of his parents.

Finally, if we look at the slum family, we often find a pervasive lack of structure, discipline, mutual concern, and respect. But this is basically the same absence of limits and true authority as is found in many middle and upper class families.

In general, we might say that during the inevitable rebellion of adolescence, if the commitment to a close person is profoundly betrayed, it is replaced by a commitment to a thing, namely, a drug.

The Social Condition

If we turn now to the social environment, we can no longer solely place the blame for drug abuse on the "horrid pusher who seduces innocent children". This demonic figure only rarely plays any role in the genesis of drug abuse. He is the profiteer, not the causation. Socially, the group who uses drugs has to be the focus of the problem. Where there is not a mature, adult community and only a weak sense of belonging, the adolescent may adhere to one of the drug cults or a "groovy group" that lends to the member a sense of solidarity, a mutually confirmed identity.



When the prevalent values of society are success, prestige, and goal-oriented pursuits, a new integrity is found in the negation of these values. Instead of the "wheeling and dealing" combined with the commercialized, noisy, competitive way of life, the individual looks for genuineness and tranquility, for serenity and introspection. When faced with a technological Babylon with an overwhelming amount of laws, tasks, and prohibitions, he rebels by disobeying these laws, limits, and conventions. And when he sees in progress "a shameless boasting about a high standard of low living", as the historian H. J. Muller has called it, he flees into a more simple, drifting but seemingly more sincere way of life.

On the other hand, in the jumble of the slums, the addict is often a hero. The "slick cat" is the successful man who has beaten the hated establishment. The quest for heroin is the quest for an identity and for a meaningful life. The deeper meaning of "hustling" lies in the "gratification of accomplishing a series of challenging, exciting tasks, every day of the week," according to Preble and Casey.

The Philosophical Problem

We find in today's culture a general resistance toward asking the basic philosophical questions of meaning and value. Instead, we see an unreflective activism and pragmatism. The contemplative search for a perspective is scorned, or simply forgotten. True philosophical questioning is rare. This betrayal of philosophy is reflected in the various mysticisms, now not less rampant than the profound value blindness of those caught in the "rat race".

In his search for real meaning in life, man has tried and experimented with many things in an attempt to flee from the frustration and despair, the delusions and disillusionment that face him. If he turns to and uses drugs in a genuine attempt to cope with this situation, he will merely be trapped into a new lie and an even more pervasive illusion. He is still left with his problems, and he must once again begin his search for meaning in life.

Treatment of the Opiate Addict in Maryland

Does the General Hospital Have a Role?

JOSEPH I. BERMAN, MD
Sinai Hospital
Baltimore

The Maryland Drug Abuse Law, passed in July 1969, created a state authority which was given the responsibility for the supervision and support of treatment programs for opiate addicts. The concern that programs developed by the authority provide the best possible care for the addict raises the question of the role of the general hospital in the rehabilitation and treatment of the opiate addict.

Up to now, the general hospital has played a most insignificant role in the long-term treatment of the addict. What contact there has been has concerned itself with the treatment of the acute side effects of addiction, ie, hepatitis, bacterial endocarditis, etc.[1]

The Past Role of the Physician and the Hospital

The medical profession has generally been excluded from the treatment of opiate addiction since shortly after the passage of the Harrison Narcotic Act of 1914. This exclusion has occurred not primarily because of the law itself, but rather through restrictive regulations developing subsequent to the passage of the law.[2] The constraints put upon the physician's ability to treat the addict, and the series of prosecutions resulting from such attempts, have effectively insulated the practicing physician from any meaningful therapeutic contact with opiate addicts.

Training in this area in the medical schools has been inadequate, thus increasing the general reluctance of physicians to become involved with the treatment of the opiate addict.

Closely paralleling the addict's inability to secure care from his personal physician has been the addict's inability to use the general hospital as a place to receive long-term care for his addiction. Addicts coming to general hospitals seeking medical care are

almost invariably referred to state or federal institutions or are even turned over to the police.

The institutions to which the addict is referred can be considered divorced from the mainstream of medical practice. Neither the practicing physician nor the medical student has occasion to come into any but the briefest contact with either state mental hospitals or federal institutions such as the United States Public Health Service Hospital at Lexington, Kentucky.

The fears of legal reprisal, the paucity of information and teaching, the very limited therapeutic success (until recently) of those specializing in the treatment of opiate addicts, together with the general feeling of society that the opiate addict is a criminal rather than a sick person, have combined to prevent the addict from using either the practicing physician or the general hospital for long-term care.

Treatment Facilities in Maryland

The actual number of addicts in Maryland is unknown. As of December 31, 1968, the Federal Bureau of Narcotics and Dangerous Drugs disclosed that there were 1,940 active recorded narcotic addicts in the state—1,765 of whom lived in Baltimore. Unofficial estimates have placed the total number of opiate addicts in the state at about 5,000.

The ambulatory treatment facilities available in the greater Baltimore area, where most of the addicts are thought to live, are very limited. The three major treatment programs now functioning are: The Johns Hopkins Hospital Drug Abuse Program, Provident Hospital's Project ADAPT, and Man Alive, Inc. Together, these three programs jointly care for less than 1,000 patients. The state program at the Baltimore Narcotics Clinic is limited to patients on probation and has a current enrollment of about 100. A few other programs care for a handful of patients.

Until recently, the treatment of the opiate addict was felt suited only to inpatient facilities and the use of ambulatory services, for such treatment was officially frowned upon.[3] This stand, however, has been challenged due to the work of Dole and Nyswander, who use the synthetic opiate methadone for so-called hard-core opiate addicts.[4,5] Although they originally required that their patients undergo a six-week period of hospitalization for regulation on methadone prior to the beginning of ambulatory care, this six-week period is no longer mandatory except for the most socially and medically disabled addicts. Their experience has shown that while some addicts will need prolonged hospitalization because of concomitant medical or social illness, the majority of patients can be safely treated in an ambulatory setting.

The General Hospital

There seems to be little reason why the ambulatory setting needed for the long-term treatment of opiate addicts could not be provided by the general hospitals in the area. Several hospitals have participated in the Dole-Nyswander program in New York city and have added important ambulatory treatment resources to the care of the opiate addict.

In many urban areas today, the problem of opiate abuse has become a major community health problem. Many local hospitals have indicated a special interest in the medical problems of their surrounding communities. To the three usual major functions of hospitals—patient care, research, and training—a fourth function, care for community health problems, has become evident. General hospitals providing treatment facilities for this major community health problem would be a proper step forward in meeting the social-medical needs of the surrounding community.

One could anticipate positive results from the incorporation of local general hospitals into a regionally planned treatment program for opiate addicts.

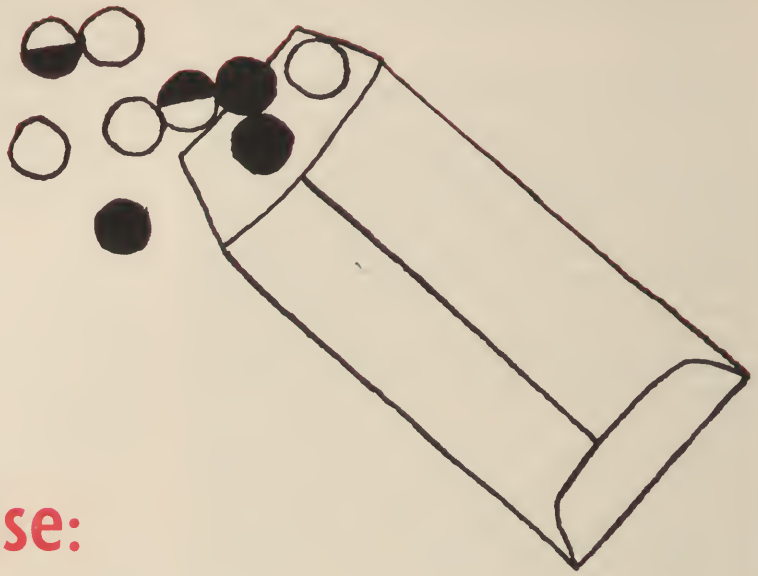
1. The treatment of the opiate addict would join the mainstream of medicine. Practicing physicians, medical students, and medical workers below the physician level, would have an opportunity to participate in and learn about the problems and treatment of opiate addiction. Such treatment should not be restricted to the methadone approach only but ought to include the use of other drugs and techniques.
2. Hospital outpatient departments, grossly underutilized, could be used during off-hours for the ambulatory treatment of opiate addicts. This would save the expense of establishing such facilities in new institutions.
3. Professionals needed for the comprehensive treatment of opiate addicts, ie, psychiatrists, internists, public health nurses, and social workers, are already available in the general hospital setting. Increased numbers of personnel could be easily incorporated into already functioning departments.
4. The acceptance by the general hospital of the opiate addict as a patient with an illness would influence both society's view of the opiate addict and the opiate addict's view of himself.
5. The opiate addict would be able to secure treatment from a facility reasonably close to his home. This would do away with the need of traveling long distances to secure treatment.
6. The image of the general hospital in its community would be enhanced by the hospital's willingness to undertake treatment of a problem of great concern to many members of the community.
7. Involvement of general hospitals in treatment programs would foster clinical trials and ex-

perimentation within a given region and could help prevent excessive central bureaucratic control.

Coordination of Services and Inpatient Beds

For medical care delivery and research to be most effective, the various hospital clinics established around the metropolitan Baltimore area should be closely linked. One approach would be the establishment of a central coordinating agency which would both advise the various hospital clinics and standardize data collection. Then, programs would not work at cross purposes and the data collected from each program would be useful for research purposes. The Drug Abuse Authority should play this role.

Because of the cost and inappropriateness of using expensive general hospital inpatient facilities for those patients needing more intensive treatment of their addiction than can be given in an ambulatory area, a facility or facilities with live-in capabilities should be available to all of the general hospital clinics. Patients requiring more intensive treatment of their addiction problems could be referred from the hospital clinic to the live-in facility and then, when appropriate, back out to the hospital clinic. Levels of care appropriate to the addict's needs should be available in this facility. Addicts needing those in-patient hospital services that the general hospitals do provide should have access to them like any other patient.



Conclusion

Traditionally, general hospitals have avoided the opiate addict and have taken little or no role in the long-term care of these patients. Changing therapeutic techniques and the willingness of many general hospitals to develop medical programs based on community need now make it appropriate that general hospitals contribute resources to the treatment of these patients. Such involvement would have numerous advantages.

For proper collection of data and for coordination of activities, a central agency, such as the Drug Abuse Authority, should be used. A live-in facility should be available for those addict patients needing more intensive treatment for their addiction.

Drug Abuse:

The Dangers and Responses

Harvey Grant Beck Memorial Lecture

The following papers and remarks were presented as a panel discussion during the 1969 Semiannual Meeting of the Medical and Chirurgical Faculty. The panel was held in the Hotel Hershey, Hershey, Pennsylvania, on September 5, 1969.

Russell S. Fisher, MD, President of the Faculty, presented the opening remarks and introduced the panel members.

The Harvey Grant Beck Memorial Lecture is supported by an endowment to the Medical and Chirurgical Faculty. Members of the panel who will present this lecture on "Drug Abuse: The Dangers and Responses" include Louis J. Kolodner, MD, who will serve as moderator; Honorable David Ross, a judge on the Supreme Bench of Baltimore city; Mr. Steven V. Sklar, a delegate to the General Assembly from the 5th Legislative District of Baltimore city; and Harvey Gollance, MD, Associate Director of the Beth Israel Medical Center and the Administrator of the Methadone Maintenance Treatment Program in New York city.

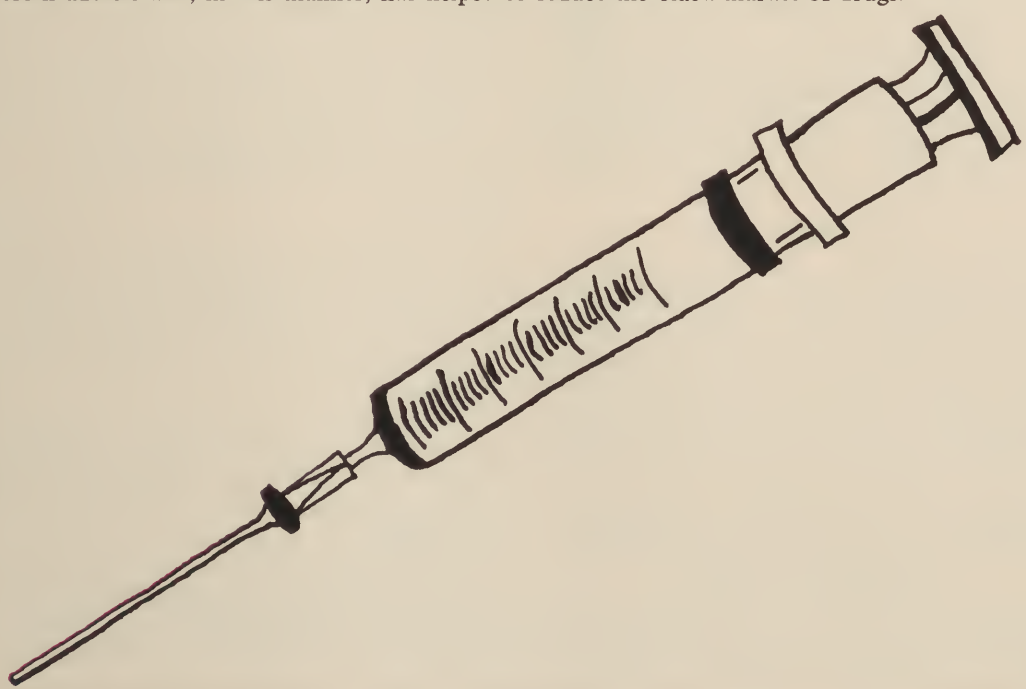
Louis J. Kolodner, MD, the panel moderator, opened the discussion with the following introductory remarks.

There is presently a malignant type of medical-social plague threatening us and adversely affecting considerable numbers of our young adults, all potentially good and useful citizens from all walks of life. The drug addiction problem is producing social, economic, psychiatric, somatic, and educational havoc in the affected individuals. Drug abuse prevention and treatment deserve to be given paramount consideration in our society today, and this problem deserves the attention and cooperation of every citizen, every physician (regardless of his specialty) and of John Q. Citizen in general.

Drug addiction reduces the productivity of many thousands of people in the United States annually. Effective educational, medical, judicial, legislative, and law enforcement measures should be initiated and sustained in order to prevent and treat this threat to our youth and to the very foundation of our country.

Dedication, organization, perseverance and, most of all, adequate funds from the city, state, federal, and private sources are needed.

The destruction of families and homes is appalling, and the loss to industry and business each year amounts to many, many millions of dollars, all because of drugs.



The Medical and Chirurgical Faculty of Maryland has been vitally interested in and is vigorously pursuing this problem of drug abuse and drug addiction and its prevention and treatment. The society has conducted an in-depth study of facilities for treating drug addiction in Maryland, particularly in Metropolitan Baltimore. It has also visited and studied New York's drug addiction treatment centers.

The Faculty has also set up guidelines for the treatment of drug addiction in Maryland.

In addition, this society has also recommended that treatment centers be located at or nearby properly equipped hospitals.

The society feels that all methods of treatment should be used to treat drug addiction, ranging from abstinence with psychiatric and social service guidance, to properly controlled and medically supervised use of blocking agents. It has approved the proper use of methadone blocking and the enforcement in the treatment of hard-core heroin addiction. I think it is one of the few, if not the first of the societies that has come out in this manner.

Finally, the Medical Faculty has established excellent liaison with the United States Department of Narcotics and Dangerous Drugs, as well as with law enforcement agencies. Med-Chi has interviewed and restrained individual physicians from unwise and indiscriminate treatment of heroin addicts and, in this manner, has helped to reduce the black market of drugs.

There are essentially two ways that drug abusers and drug addicts come before the criminal courts. Violating our narcotic laws, either through the sale or possession of prohibited narcotics and its accompanying paraphernalia, is the first way. The other way is through committing crimes to support the drug habit or to finance the purchase of illicit drugs. Addiction itself is not a crime, and under our Federal Constitution the states are prohibited from making it a crime.

Drug Abuse and the Courts

THE HONORABLE DAVID ROSS
Judge
Supreme Bench of Baltimore City
Baltimore

In the criminal court we deal with individual defendants on a case-by-case basis. Looking at it from that point, I am not able to ascertain from my own personal experience, nor have I been able to satisfactorily ascertain from what meager statistics are available, just how large the problem of drug addiction is in our own city of Baltimore, the state, or the country. You hear many conflicting stories, many different figures. However, from what I have seen dealing with it on a case-by-case basis, day to day in the criminal court, I am willing to accept the statement of Robert E. Farber, MD, Baltimore City Health Commissioner, that drug abuse is a major public health problem in Baltimore city.

I would also add that the drug problem is a major crime problem, not only because possession and sale of narcotics and possession of narcotic paraphernalia are crimes, but because of the large number of crimes which are committed to finance the purchase of narcotics. You usually hear a habit referred to in terms of dollars a day. It can run anywhere from $15 to $100.

Financing the Habit

Almost invariably the habit is financed through crime (ie, robbery, burglary, armed robbery, and forgery). If the theft is one of money, there is usually a direct correlation between the amount stolen and the cost of supporting the habit. If the theft is one of stealing property, such as a television set, it must be three to five times as much in value as that which the addict needs to support his habit.

If an addict has a $100 a day habit, he must steal at least $300 worth of property a day to finance it.

Determining the Verdict

What part does a criminal court play in the drug abuse problem? First of all, we receive the cases, and the charges stated in them. We have to determine the guilt or innocence of each particular defendant. This is done either by a jury or by the judge, depending on the election of the defendant. In Baltimore city, it is usually the judge who hears the case. We have a very small percentage of criminal jury trials here.

I subscribe to the view frequently stated by judges that deciding guilt or innocence is relatively easy when you compare it with the problem of deciding what to do with the defendant after his guilt has been established.

Under our system of law, the state has the burden of proving a defendant guilty beyond a reasonable doubt. On the question of guilt or innocence, if there is a reasonable doubt as to guilt, then the verdict must be—not guilty. But if you find the defendant guilty, you must then make disposition of his case. You must either send him to prison or place him on probation, and this is where the difficulty begins.

Any case is difficult and it is particularly difficult when you are dealing with a drug user or a drug addict. The primary goal in sentencing is to protect the public.

In order to protect the public, we subscribe to the theory of deterrence. We either try to deter the defendant from committing the same crime again or we try to deter others from committing similar crimes by using the defendant as an example in sending him to prison.

We also believe in the value of rehabilitation. If you can take a criminal and turn him into a useful member of society, then you have cut down the criminal population by one, in any event, and society is protected.

To help illustrate some of the heartaches and difficulties that go into disposition of cases involving drug users and drug addicts, I am going to refer briefly to two cases which I think exemplify the problem.

Case 1

The first case involves a man who was found guilty of possessing narcotics and narcotic paraphernalia. He was sentenced to prison. He requested immediate disposition following the determination of guilt. However, at the conclusion of the case and after his sentence was imposed, I advised him and his counsel that if I could be shown there was some real motivation for rehabilitation, I would give consideration to subsequently suspending the sentence and placing him in an available program, if they could find a program suitable to his problem.

I soon received a letter from his wife, part of which read:

"I think my husband could still be a worthwhile person if given the help he needs with his drug problem. The only problem we ever had as far as our marriage goes stemmed from that. He has always treated me with respect and his children also. We have two children, a girl eight and a boy three. It is very hard to make them understand why their father cannot be with them. They love him and ask for him all the time, especially the little boy. The main problem came from the fact that he couldn't hold a job when he was on drugs. He had a very poor bringing up, but he can be as responsible as anyone else when he is not using drugs."

In a psychiatric evaluation report from the Department of Correctional Services, I was told the following:

"This is a 31-year-old married white man. He is incarcerated for having narcotics and paraphernalia in his possession and for forgery. He has a very long history of difficulty with the law, including truancy at the age of 13, breaking and entering, possession of narcotics, robbery, and forgery. His life style is definitely passive-dependent and he does not present a serious threat to other persons. He is a serious narcotic user and spends $15 to $25 a day for heroin. His work record is sporadic. A history of his past reveals a very laissez-faire relationship between himself and his father.

"Diagnostic impression: Severe sociopathic personality with heroin abuse. Recommendation: Routine processing through the prison system. Note: This man is quite unlikely to be a candidate for probation as his ability to manage on the outside is not likely to be any better than it has been in the last ten years."

The difficulty in this case is not really the decision, but rather what to do with the defendant. With that type of advice and recommendation, there is no alternative but to let him be processed through the prison system. The problem lies in the family he leaves on the outside. A further problem arises after he is processed routinely through the prison system. The maximum sentence he can receive for possession of narcotics is five years. There is very little hope that the five years in prison, if he spends that much time, is going to turn him out on the streets any better off than when he went in. Moreover, the chances are quite high that he will, when he does get out, resort to the same life style he had when he was incarcerated. So that really the prisons, in a case like this, are no more than revolving doors. A particular man is kept out of society temporarily, but neither his problem nor society's problem in respect to him are solved.

Case 2

Another case which I would like to mention concerned a 31-year-old Negro man who had been addicted to heroin since 1954. He was about 15 years old when he first came into court. He had been sent to the Lexington, Kentucky, Federal Hospital for Narcotics Addicts. He had also been sent to Spring Grove Hospital and had gone through their program. The people at Spring Grove were very enthusiastic about this individual, particularly because of his earnest motivation, and his high intelligence. They had hoped that he could make an adjustment. Before employment could be found for him, however, during his stay at Spring Grove, he was back on narcotics and was rearrested for larceny. He came before me on the charges that resulted from these crimes which he committed while he was a patient at Spring Grove Hospital.

I was convinced in the short time that I saw him in the courtroom, that he was a candidate for rehabilitation if some program could be found for him. He certainly presented evidence of motivation. He even admitted that he was tired of the drug habit. I knew that he had the ability to become a productive citizen.

However, he was guilty of several crimes and received a very substantial sentence, but was placed on probation. Presently, he is in Project ADAPT which is operated by Provident Hospital. It is reported that he is doing very well.

Overview

The real problem that the criminal courts have, from the drug abuse standpoint, is finding a program which will suit the needs of the addict. There are few programs available that offer any hope of helping a narcotic addict. Little is known about the effectiveness of these programs because the funds that are available to them are rather scarce and they are used for the programs themselves. Funds are not used in collecting statistics or follow-up.

While more knowledge about rehabilitation programs is becoming increasingly available than ever before, it is just a start. Much remains to be done and much remains to be noted. We have a long way to go before we achieve any real correlation between the criminal courts and rehabilitative programs.

The Addict, Rehabilitation, and the Law

STEVEN V. SKLAR, LLB
Delegate
General Assembly of Maryland
Fifth Legislative District
Baltimore

Drug abuse, and I speak mostly in relation to hard core narcotic addiction, is a primary cause of the increase in the crime rate today. We have estimates by statisticians and by judges in the Baltimore area, that 50%, if not more, of all crimes committed in the area are motivated by drug addicts in need of funds to support their habits.

Drug-Crime Cycle

Today we have what is known as a drug-crime cycle. As Judge Ross said, the addict who is hooked needs about $50 a day to support a modest habit. In order to get that, he has to resort to illegal means, ie, forgery, burglary, etc. Judge Ross quoted a figure that he has heard that is as high as $140 a day. I met a lady at the correctional institution for women at Jessup who was on a $600 a day habit. Now, this is net. That is what she basically needed. However, she needed close to $2,000 a day of stolen property just to keep her head above water.

The traditional approach to this cycle of drugs and the necessary crime to support the drug habit has been a characterization of the problem as criminal (It is a crime), and the approach has been penal (Put them in prison). Well, we don't think that that approach has worked very successfully.

Recently, the General Assembly passed and the Governor signed the Comprehensive Drug Abuse Control and Rehabilitation Act of 1969. What it does is this: It invokes a change of philosophy. Instead of combating the drug problem by merely drying up the availability of drugs and, therefore, the opportunity for addiction, we think that a new approach, a realistic approach, should be taken. Instead of viewing the addict as a criminal, we are viewing him as a medical problem. Instead of trying to rehabilitate him in an institution, we hope to offer him therapy in a medical setting.

New Approach Developed

Therefore, we have a new bill, House Bill 1257, which sets up a new approach in Maryland to combat the problem of drug abuse. Very briefly the act does this: It sets up a three-man authority called the Drug Abuse Authority, whose power is to regulate, devise, operate, and administer all of the drug programs in the state. The crux of the bill is a commitment proceeding. Under the proceeding, a man who is not charged with a crime, but who is an addict, may voluntarily petition the circuit court of the city or county and ask to be committed as an addict to the jurisdiction of the Drug Abuse Authority. Or else, someone close to him, who has a special interest as defined by law, may petition the court, saying that the person is an addict and should receive care. Persons who have been convicted of crimes in the circuit courts or in the lower courts, as an alternative to sentencing in a penal institution at the discretion of the trial judge, may be committed to the Drug Abuse Authority for rehabilitation programs. Even the prisoners already incarcerated may, under certain

circumstances, and with the approval of the State Parole Board, be committed by court order to the authority of the three-man commission, the Drug Abuse Authority.

It is also the duty of these three men, who are appointed by the Governor, to devise, coordinate, and conduct rehabilitation programs within the state.

Now, the law is purposely flexible. We do not, as legislators, want to define the best medical approach or the technique to be used. This is not our area of expertise. This area is left to the people who do have the expertise, the physicians and those in allied professions. What we are trying to do is to insure flexibility of approach. If methadone proves to be a very effective method of treatment, then we want it to be used. In fact, we have permissive language in the bill which calls for the use of maintenance dosages of addicting drugs. Under the law, methadone can be used under the auspices of the state. What we want to do now is to insure that any new developments that come out of the medical profession and medical research can be used in any subsequent state program for rehabilitation. We do not want to be limited to past programs that have outlived their value and effectiveness.

Under the act, the Drug Abuse Authority is empowered to conduct research in the state. It is also designed to educate and train physicians, nurses, and medical students in the area of drug addiction and rehabilitation, as well as to inform the public about the problem. The authority also has facilities available to gather and maintain needed records and statistics.

It is the duty of every physician in the state to report to the Drug Abuse Authority any information their regulations require in regard to drug abuse and the treatment of drug addicts.

Finally, the Drug Abuse Authority must approve and authorize all rehabilitation programs in the state, as well as approve every individual physician who offers treatment in the area of drug abuse. It is important that we have strong regulations in the area, because if there are poor standards in any program, especially one in which maintenance drugs are being used, there will be abuses in the program, and these abuses are going to produce two results. One will be ineffectiveness as far as any rehabilitation goes, and the other will most likely be illegal drug marketing.

Educating the Public

The legislature is concerned with a number of problems. First, we have to educate the public Presently, the public is insensitive to the plight of the addict. They hear about it, they read headlines about raids, prosecutions, and convictions, but they are insensitive to the man who is affected by the drug. What we have to do is to try to eliminate the traditional approach to drug addiction in the minds of the public. You just cannot take an addict, put him in jail, throw the key away, and hope for him to come out a rehabilitated individual and never resort to his habit again. We have to take a realistic and sensitive approach to the addict himself.

Operating Programs

Secondly, the concern of the legislature is to stimulate the medical profession to develop and to operate programs that are effective and reliable in the area of drug abuse. There are many gaps in our knowledge now on how to treat an addict. About the only point you will have agreement on is that there is a diversity of opinion in the medical circles. But there are new programs that appear promising, and that have produced results which are significant. I think we are now on the threshold of breakthroughs in the medical field.

We must discourage what I think is petty bickering and rivalry between the competing philosophies and approaches to drug abuse today. The medical profession, no less than any other group, is subject to political give and take. On one side you have an abstinence program, whose philosophy of drug abuse and drug addiction is psychological, and on the other hand you have the maintenance approach, whose treatment is predicated on a metabolic reason for drug addiction. But the problem is that you have very little acceptance by one school of the other's teachings, approaches, or results. In effect, you have an attempt to cover up shortcomings in a program, and to "fudge" results and statistics. Generally, a noncooperative attitude exists between the groups, and the ones who lose are the poor addicts that come in for treatment.

We, as legislators, must encourage the addicts themselves, through the law and through other means, to avail themselves of the opportunities for rehabilitation. We have to make programs. We have to make legal alternatives attractive enough so that an addict will come in on his own and seek help. Word of a program with proven effective results quickly spreads, and the addicts want to come.

Coordinating Policy

We must coordinate an effective policy toward drug abuse on all levels. This means the courts, the legal profession, the medical profession, the pharmacists, the social services, the police, and most importantly, our school system, must all work together.

We view drug abuse today as a threat to our safety, and to our continued prosperity. But we cannot waste our time on more studies. The time today is for action. If we have an enlightened approach and if we develop reliable, effective rehabilitation methods, then the government and the medical profession together, can make a real inroad to solving a previously unsolvable dilemma.

Methadone Maintenance Treatment Program

HARVEY GOLLANCE, MD
Associate Director
Beth Israel Medical Center
Administrator
Methadone Maintenance Treatment Program
New York, New York

Drug addiction has reached epidemic proportions in New York city and in other sections of the United States as well. An effective treatment for severe heroin addicts known as the Methadone Maintenance Treatment Program has been developed at Rockefeller University and has continued in a greatly expanded program at the Beth Israel Medical Center in New York.

Facilities for the treatment of narcotic addiction were almost nonexistent in New York until the 1950's. It was then that the increase in the number of addicts in the low-income areas was recognized, as was the increase in the use of narcotics by the young. Concerned city authorities prompted the Department of Hospitals to establish facilities for adolescent drug users. As a result, a 140-bed hospital, Riverside Hospital, was opened in 1952. Psychiatrists and strong rehabilitative and supportive services were provided. In addition, beds were obtained in a proprietary hospital, Manhattan General Hospital, to detoxify narcotic patients. With one exception, the chiefs of service of the municipal general care hospitals resisted the treatment of drug addicts in their service. Few physicians were interested, and almost all refused to treat the addicts.

A study was done by Columbia University in the late 1950's of 248 patients discharged from Riverside Hospital. It showed that almost 100% of the patients still alive became readdicted shortly after discharge. Ray E. Trussell, MD, Director of the School of Public Health and Administrative Medicine of Columbia University, during a sabbatical leave, had been appointed Commissioner of Hospitals of New York city in 1961. Dr. Trussell, as a result of the Riverside Hospital study, and because of additional serious administrative problems, decided that Riverside Hospital should be closed, and that we should seek new approaches to treat drug addicts. Riverside Hospital was closed in 1963. Although it had given its patients some social assistance, it failed both in preventing readdiction and in rehabilitating its patients. It seemed clear that the answer to the treatment of narcotic addiction lay in new directions to be determined by future research.

Research Encouraged

The Health Research Council of New York city was interested in encouraging research in the area of drug addiction, and in 1963 they initiated a grant to two Rockefeller Institute physicians: Vincent Dole, MD, a specialist in metabolic research; and Marie E. Nyswander, MD, a psychiatrist with long experience in drug addiction.

Dr. Dole and Dr. Nyswander attempted to find a means of treating a patient which would enable the patient to function productively in society. The researchers considered drug addiction as a physiological disorder and thought it reasonable to ask whether some medication might control the drug hunger. At first, they attempted to maintain patients with morphine. While this did away with much of the patient's antisocial behavior, it did not make him productive. Next, they used methadone in an unusual way, giving their patients gradually increasing doses until the tolerance level was reached, usually between 80 to 120 mg daily. When patients reached this maintenance level, usually after six weeks of treatment, the physicians found that several things happened:

1) The patient showed no harmful effects from methadone. He was neither sleepy nor high. Medical examination and all types of medical, physiological, and psychological testing showed no harmful effects from methadone.

2) The patient lost his drug hunger.

3) The effect of heroin was blocked. Even when given an injection of heroin, the patient experienced no effects from it.

4) The dosage of methadone, once established, remained stable. It did not have to be increased, and was long-acting (24 to 36 hours).

Growth of the Methadone Program

After intensive study and experience with six patients, Dr. Dole went to Dr. Trussell, showed him the histories of his six patients, and asked for facilities to expand this work. In 1965, through Commissioner Trussell's efforts, beds were obtained at the Manhattan General Hospital. This hospital of 386 beds later was acquired and became an integral part of the Beth Israel Medical Center. This was done through the help and cooperation of the president of the Board of Trustees of the Beth Israel Medical Center, Mr. Charles H. Silver. In 1966, the center was renamed the Bernstein Institute of the Beth Israel Medical Center. It is the largest center for drug addiction under voluntary auspices. Methadone Maintenance is one of several narcotic programs of the Bernstein Institute.

In five years, the Methadone Program has expanded to the point where over 1,300 patients are currently being treated in four hospitals and 15 clinics under the sponsorship of the Beth Israel Medical Center. Several additional voluntary and municipal hospitals and clinics are now almost ready to join the Beth Israel Methadone Maintenance Treatment Program. The inpatient phases of the work are done either at Beth Israel or at Harlem Hospital. Clinics have been established at Beth Israel Medical Center, Harlem, St. Luke's, and Cumberland Hospitals. In addition, a number of hospitals in New York city have established their own methadone programs based on the work done previously at the Beth Israel Medical Center.

This program considers the addict a patient with a chronic disease. The individual whom it treats is the hard-core addict who suffers from euphoria and drug hunger, is unable to function socially or economically, and must take drugs to relieve his physical misery.

Naturally, we realize that it would be best if the cause could be removed and the patient made drug-free. But all programs which have attempted this in a community setting have failed. This program deals with the symptoms. The methadone blockade against opiates frees the addict from his drug hunger so that he becomes receptive to rehabilitation. It should be stressed that this program deals with the long-term, usually criminal addict, who has been unable to make it in any other way. Our goal is social rehabilitation for those who have been unable to achieve abstinence.

Treatment Approach

The Methadone Program is not based on a psychiatric approach. While psychiatric consultation is needed for a number of patients, it is not the primary modality. Our experience has shown that the program is equally effective in a department of psychiatry, medicine, or community medicine. The important factor is competent direction by an interested physician. Our experience has also shown that there should be available good medical and obstetrical services by physicians who are familiar with methadone patients and who are available for back-up in the program.

Intake of Patients

A central intake of patients for all the clinics and hospitals associated with this program has been established under the direction of a skilled staff. This staff has had experience working with addicts, and their backgrounds are essentially in social service. They screen the applicants for acceptability in the program. A research assistant (an addict in the program who has proven himself) is of great assistance in this procedure.

Originally, because this was an experimental program, very rigid qualifications for admission were established. These subsequent qualifications and their modifications are:

1. *Age*—Originally, age was set at 21 to 39 years. The patient had to be able to sign a consent form but could not be over 39 because of the theory that drug addiction decreases with age. The age requirement has now been changed to 18 years with proper consent. No maximum age limit now exists. We even treat patients collecting Social Security, and those registered with Medicare.

2. *Residence*—New York city residency is required because of reimbursement aspects.

3. *Addiction*—Only opiate addicts are accepted. Severe barbiturate and amphetamine users are rejected, as well as are those with multiple addiction (ie, combination of opiates with barbiturates). However, the final decision for acceptance may be modified by the clinician in charge.

4. *Length of drug use*—Originally, a minimum of five years of mainlining heroin was set. This has been gradually reduced and is now two years.

5. *Psychiatry*—Any history of psychoses or severe mental disturbance is usually cause for rejection. This may be modified by the clinician.

6. *Addiction in family unit*—If the patient's spouse is addicted, both must be eligible and admitted together. The same is true of any family members living in the same household.

7. *Alcoholism*—Severe chronic alcoholics are rejected.

8. *Mental deficiency*—Addicts are rejected if I Q is so low that they cannot handle the responsibilities of the program.

9. *Medical*—Cirrhosis of the liver, diabetes, epilepsy, and terminal conditions were originally reasons for rejection. We now have no medical exclusions.

10. *History of previous unsuccessful treatment*—This has now been modified, and a determination is made according to the judgment of intake personnel.

11. *Acceptance of patients*—Finally, the physician in charge must approve the selection of the patient.

Procedure

When it has been determined that the patient meets the criteria and a vacancy for treatment occurs, he is admitted into a *Phase I Program.* Originally, this was a six-week period of hospitalization on an open ward. This phase has been modified and now, in a high percentage of cases, it is done on a strictly ambulatory basis. The patient is given divided doses at first. As the dosage is increased, and there are no undesirable side effects, the dosage schedule is changed to a single daily dose. The methadone is dissolved in an orange juice substitute and taken orally.

After reaching maintenance level, the patient is next assigned to a *Phase II Clinic.* At first, the patient reports daily. He leaves a urine specimen which is tested for opiates (heroin and morphine), amphetamines, quinine, barbiturates, and methadone. He drinks his dose of methadone in front of the nurse, and periodically reports on his activities (eg, school, work), or problems. As the staff is convinced of the patient's progress, he is required to report less often—three times a week, twice a week, then once a week. However, when he does report, he drinks that day's dose of methadone in front of the nurse (to be sure that he is still taking it), leaves a urine specimen, and is given his daily supply of methadone for those days when he does not report to the clinic.

We try to limit the size of our Phase II Clinic to less than 100 patients. Each clinic has a part-time physician, a nurse or nurses (depending on the hours of the clinic), a supervisor, counsellors, a research assistant (ex-addict), and clerical personnel. Back-up medical, psychiatric, pharmaceutical, social, legal, and other services are provided when needed.

It is during Phase II that serious efforts are made in the rehabilitation of the patient. A wide spectrum of services is offered to the patient in the areas of medical care, counselling on problems of everyday life, social services in regard to family living and community resources, vocational rehabilitation, and legal defense advice. The older patients on the staff are especially helpful in this phase, and are constantly available to help with problems peculiar to addictive patients.

After a year, when the staff is convinced that the patient is doing well, at a job, at school or at keeping house, and the patient seems to have no problem with alcohol or drugs, he is assigned to a *Phase III Clinic.* The treatment is essentially the same, but the frequency of visits is much shorter and there is little need for the counselling staff. These services, however, are available if needed.

Evaluation

From the start, in 1964, this program has had independent evaluation of all the patients who have ever entered it. Originally, when the city financed this program, money was allocated to the Columbia School of Public Health to perform this evaluation. When financing of the Methadone Maintenance Treatment Program was assumed by the State Narcotic Addiction Control Commission in 1967, a separate contract was given by the state to the Columbia University School of Public Health and Administrative Medicine to continue this evaluation. A high-level committee was appointed. The charge to this committee was to evaluate the results of this program in an objective manner, and to make recommendations based on this evaluation. Frances Rowe Gearing, MD, was appointed the Director of the Evaluation Unit.

In their report of March 31, 1968, the committee reached these conclusions: "The results of this program continue to be most encouraging in this group of heroin addicts, who were admitted to the program on the basis of precise criteria. For those patients selected and treated as described, this program can be considered a success. It does appear that those who remain in the program have, on the whole, become productive members of society, in contrast to their previous experience and have, to a large extent, become self-supporting and demonstrate less and less anti-social behavior. It should be emphasized that these are volunteers, who are older than the average street addict and may be more highly motivated. Consequently, generalizations of the results of this program in this population to the general addict population probably are not justified. There remains a number of related research questions which need further investigation."

A report, as of March 31, 1969, showed there were 153 women and 861 men who had been under observation three months or longer.

> "Among the women, 10% were employed on admission. After 12 months, 33% were employed. Fourteen percent were homemakers, and 3% were in school. After 18 months, 65% were employed, in school, or homemakers and, after two years, this percentage had increased to 73%."
>
> "Among the men, the percent of those employed or in school increases from 26% on admission to 56% at 12 months, 70% at 24 months, and 83% at three years. The percent of men on welfare or supported by others decreases proportionately from 54% at six months to 44% at 12 months, 30% at 24 months, and 17% at 36 months."

"The arrest records of those who enter the Methadone Program and those who enter our Detoxification Program are similar. Patients who are accepted have to wait a long period. Acceptance into the program does not have a marked effect on their pattern of arrest in the 12 months prior to admission. Following admission, there is a marked decrease in arrests while the pattern of arrest among the contrast (detoxification) group is very similar to earlier patterns."

None of the patients who remained in the program have become readdicted to heroin. Problems with drug abuse (amphetamines and barbiturates) varied from 4% to 12%.

The Methadone Maintenance Treatment Program is an effective, economical way of treating hard-core heroin addicts who cannot be treated successfully with any existing programs. It can now be done on an entirely ambulatory basis for most patients. This makes the program feasible for those areas where inpatient beds are difficult to obtain. We feel it is very important that this program be a structured one so that it remains carefully controlled.

Methadone Maintenance Treatment for heroin addiction is a public health program. It should be accomplished under the direction of a public health department, a hospital, or an organized medical facility. Since rehabilitation and social productivity of the patient is the prime objective of this program, it is important that the means to do this must be an integral part of the program. It is not sufficient to prescribe methadone alone.

Under these circumstances, the addict is given a chance in a program which he is capable of handling, and which offers him a realistic path to living as a responsible member of his community and of society without the crutch of heroin.

Mr. Lichtman, whose statements follow, is a research assistant at the Beth Israel Medical Center. Before becoming an assistant there, he was a drug addict. In conjunction with Dr. Gollance's article on the Methadone Maintenance Program, Mr. Lichtman tells how the program has helped him.

I am 29 years old. I started using heroin at the age of 15. I used it for a period of approximately ten years. Approximately four of those years were served as a guest of the city, state, and federal governments in any number of institutions.

After a period of ten years, I found that a strange thing happened to me. I developed a certain motivation which I had not had during that time. I decided that I wanted something more than I had had for those ten years. I came to the Beth Israel Medical Center in April 1966, at which time I applied for the Methadone Maintenance Program. The reason that I had originally applied for that program is that I had unsuccessfully tried other methods of treatment when coming out of institutions in other programs. I found that the same drug craving which I had in going into a program would return upon my release from an institution.

I had heard many stories about methadone. I heard that while taking methadone you are still addicted, and you would not be able to function in the community. But I decided that since I had not been able to function in the other programs, that I would try methadone.

As I said, I went into the hospital, and stayed there for a period of six weeks, during which time the methadone level was increased.

After leaving the hospital, I returned to my family, who were skeptical. My father owns his own business in Manhattan. He is a furrier and does make a good living. During the ten years I was using drugs, he did not allow me into his place of business. When I returned there from the methadone program, as I said, he was skeptical, but was willing to take a chance with me.

I lived at home for four months, at which time I met a young lady who was also willing to take a chance with me and who knew my background. After about six months, we were married.

I now have a lovely home in Riverdale, and a new car. I work for the program in helping other addicts attain that which I have attained.

I find there is no real "hang-up" in using methadone. I leave a urine specimen when I come into the clinic weekly and pick up six bottles of medication to take home with me, which I take at my leisure. Methadone is a long-acting drug. I take the drug at any time during the day, and sometimes forget to take it and then overlap hours. The drug lasts anywhere from 24 to 36 hours. I have never experienced any withdrawal symptoms.

As I say, there is no drug craving, and no outward appearance of euphoria. Methadone does not produce these symptoms as other opiate drugs do.

In the time I have been on the methadone program, I find that there are many people who are willing to take a chance on the addict population once they (the addicts) are stable on it, ie, the maintenance drug. In New York city alone, we have many large organizations, such as the telephone company and large construction firms, who are willing to employ some of our people in the program.

It is difficult for me to tell you all of the things that have happened to me in the past. I have a new life today and it is something that I was never able to have before.

The Communication Gap and the Drug Problem

I am here to make a plea for communication—the kind of communication that should exist between patient and physician, between teacher and student, between parent and child, and between husband and wife, but does not. This lack of real open-door communication leads to drug use. In Canada, experts found, when they talked to young drug users, that the kids complained of having no one to identify with or to communicate with.

NEIL SOLOMON, MD, PHD
Secretary of Health and Mental Hygiene*

I would like to share with you an experience that I had recently in Canada with the leading officials there concerning the drug problem. Before doing so, I would like to ask the research assistant, Mr. Lichtman, to tell me why he started taking drugs.

Mr. Lichtman: There are a number of reasons why I started using drugs. I came from an upper middle income family, but I felt as though this was not what I was seeking. I just drifted off to a new group of friends who were not of the class that I was used to. I felt that this was a new thing. It was something that I could try that they had tried and said was wonderful. But I found that once I had become addicted to heroin, it was a lot easier to get started on it again than it was to get off of it. It was so easy to start. I just kept going to jail and other institutions, then coming out and returning to drugs because of these people whom I associated with.

Mr. Lichtman's is not an atypical explanation, and the thing that we learned is that if you have to pinpoint one specific reason, you cannot do it. Everyone is an individual and everyone has his own reasons for using drugs. But if you are looking for some basic, underlying, general reason, it is lack of communication. This is the lack of communication that is found between someone whom you trust, care about and identify with, but cannot communicate with.

The Canadian experts went into the field and talked to kids. These kids, drug users, complained that they did not have anyone to communicate with. "If we could have talked with our parents, really talked with them on a two-way basis, perhaps we would not have taken it (drugs), but we could not talk with them," one young person remarked.

I feel that the answer to the problem lies in education. And I do not just mean educating the student. I mean educating the community and the parents, in addition to the students.

Parents and children should be educated to react to each other in a way that does not seem frightening to children nor challenging to parents.

Let me be more specific. Suppose we organize a program, whereby one student from each school would be designated to meet with us in groups and discuss the problem, we could begin to solve the communication problem. We would meet with those students with positive attitudes, not those in trouble. We would try to get them to reach the troubled students by their own interaction with the other students of their schools. The majority of students want to do what is right and proper. But sometimes they are quite confused and their sense of values is "up for grabs". This is their vulnerable period.

Of course, I feel that if you cannot prevent the problem, you must cure it by rehabilitative means. There is no substitute for the dollar in developing rehabilitative programs throughout the state.

Many people ask, "Where are the drugs coming from? And what about the laws?" I believe that we should strengthen the laws, but direct them more towards the suppliers than the users. Take marijuana, for instance. The students are not going out looking for marijuana. They are not driven by a psychological and chemical addiction to get it and take it. The suppliers are coming to them. The students that we spoke with in Canada and the students that I have spoken to here will not go out and seek it. However, they will take it when the supplier comes to them.

If you could eliminate the suppliers, you would eliminate the problem. I feel that the problem of marijuana could be eliminated in this country if we could get to the suppliers, and there is no reason why we cannot do this.

I believe that the Mafia is involved in bringing the hard narcotics into this country and Canada. There is no question about it.

The Mafia sells marijuana to students for a reason. It really does not profit the organization, as such. But it involves the students with the hard stuff, the profitable stuff. It is not hard to slip something into the marijuana and get the students hooked.

Some kids, to whom the Mafia did this in Canada, noticed that after smoking marijuana, they experienced reactions which they had never had before. They were sick. They went to their local physicians, and were given an antidote for this type of drug. It was not the proper antidote. As a result, one person died, and several others came close to dying. There was no known antidote for this material because the material was not known.

This same group of marijuana smokers then went to the scientists at the University of Montreal. These men analyzed the material in the marijuana and found it to be an STP derivative. They also found out that the proper antidote was completely different than that which was given to the youngsters at the hospital. Naturally, they prescribed the correct antidote and notified the area physicians about the matter. When the youngsters realized that they had been double-crossed, they gave the authorities information about the pushers.

This proves that a person's sense of values is, at times, placed in a precarious position. If there is no way for a person to reinforce his positive qualities, this precarious position leads to drug use. It is our job to educate any would-be user to the inherent dangers in drugs. But education cannot take root without communication. Lack of communication began the drug problem and only adequate communication will end it.

** Maryland's Secretary of Health and Mental Hygiene, Neil Solomon, MD, PhD, while not listed in the program as a panel member, gave his views on drugs from the audience when called upon by Chairman Kolodner.*

Following Dr. Solomon's remarks, members of the audience supplied written questions to the Chairman of the panel, Dr. Kolodner.

A panel discussion followed and included Dr. Solomon, Dr. Gollance, Mr. Sklar, Judge Ross, and Mr. Lichtman.

Chairman: How long must methadone maintenance continue? Must it be continued for life?

Dr. Gollance: This is a question we have kicked around for a long time. It is a natural question to ask, "Can you take the addict off after time?" Under carefully controlled conditions, we have considered it. However, when we talk to our patients, as you heard Mr. Lichtman say, they will tell us, "Look, I have a job now for the first time, I have some money in the bank . . . don't let me down." One fellow said, "I drive a Volkswagen, I am married, I have a child. If I go off methadone and take a shot of heroin because I have a problem and I get arrested, everything I have accomplished in the last few years goes down the drain."

It is something that we would like to try very carefully if we had resources. At this point we are putting all of our dollars into the 80% of those patients that we know we can help.

Chairman: Will the delegate and the judge comment on the influence of organized crime such as the Mafia in this problem and whether proper attention is being given to this?

Mr. Sklar: First, the Mafia itself is concerned with certain aspects and certain types of drugs. Heroin is exclusively the domain of the Mafia, no one else. If anyone else gets into the market, they are very quickly eliminated. It is very easy to pull off a gangland murder in the narcotic area. Joe Smith is found dead one day from an overdose of drugs, and who is to say whether he administered it himself or someone else did?

All (if not almost all) heroin is imported into the country from France. It is originally grown as raw opium in Turkey and then smuggled into France where it is processed, particularly in Marseilles. The Mafia makes its purchases throughout France, smuggles it in through New York almost exclusively, and then has a very, very intricate and vast distribution system within the United States.

There is so much profit involved that anyone who wants to make a buck, who is in the Mafia, certainly does. One hundred kilograms of raw opium is converted into 10 kg of morphine raw base, which then goes to make 1 kg of heroin. When it was first purchased in Turkey illegally, it is about $3,650 for that 100 kilograms, and when it arrives on the street, or in any local hangout for narcotic pushers in the city, that same 1 kg of refined heroin that started off for $3,650 is retailed in the vicinity of $225,000.

So you can see that organized crime is really in it for the profits. They use the money from this to finance other aspects of illegal activity, numbers, legitimate enterprises, front enterprises, construction, etc.

It is very difficult to track these people down, and get back to the top in a multilevel distribution system, particularly when you have to produce evidence to convict in court. But the police are doing their best job. Seventy percent of all convictions of Mafia personnel in the country are on drug convictions. It is a slow process, but we can assure you the federal and state officials are doing their best.

Judge Ross: There is very little that I can add to the fine answer that Delegate Sklar has given.

Chairman: Dr. Gollance, maybe you can answer this: What is the cost overall each year for each addict?

Dr. Gollance: This has been dropping for us each year. Originally, when we had to have six weeks of inpatient hospitalization, it was expensive. At the current time, with all the supporting services we give—and this includes not only counselors, research assistants, pharmacists, and nurses but even a lawyer on a full-time basis to help patients clear up their legal difficulties so they can enter the program—it is now about $1,000 a year for each patient. But as we get more and more patients into phase three, it should decrease, and as we go on a greater ambulatory basis, the yearly cost should decrease.

Chairman: I will field this question: What is being done to prevent the development of addiction?

Mr. Lichtman: I think by stemming the tide of the active addicts within the communities you would greatly stem the possible addiction of further adolescents and youth. By taking the older addict out of the community and putting him into treatment, less drugs would be available to the young people.

Dr. Solomon: I believe that the educational aspects should be controlled on a local level, with the help, though, of state and federal experts. But I would leave it up to the local people to decide what their problem is. Then help them to educate the people in their area to deal with this problem.

Chairman: Would Dr. Gollance please discuss the treatment of addicts in the private physician's office with methadone?

Dr. Gollance: We are opposed to this. We feel that methadone should be only used in a very structured program. As I said earlier, the methadone just permits you to begin to work with the patient. It is not just the giving of the methadone.

We had one physician from Florida who had started to do this on his own. By our standards, he was doing everything wrong. When he came up and saw what we were doing, he agreed to close his clinic. I read later in one of the Miami papers that the Federal Bureau of Narcotics had taken away his narcotic license.

Chairman: How can the Women's Auxiliary to the Medical Society help in this program?

Dr. Solomon: I think that if this society can give the youth of today straight, honest answers, our young people would decide not to take drugs.

your medical faculty at work

by John Sargeant
Executive Secretary

The Executive Committee met on Thursday, October 8, 1970, and took the following actions:

1. Authorized legal counsel to proceed with injunctive action against the use of the term "Chiropractic Physician", after consulting with the Attorney General;
2. Authorized proceeding with a Survey on Professional Liability incidence in Maryland for the past ten years, and appropriated funds for this purpose;
3. Agreed that physicians' defense panels should be held at various locations in the state rather than only in Baltimore, but that variations would occur depending on the defendant's and the panel participants' location;
4. Agreed that legal counsel should not reveal to defendants any written communications in cases that are discussed within the physicians' defense panels;
5. Agreed to recommend that the Commissioner of Motor Vehicles appoint Mario Mendoza, MD, Silver Spring, to the Medical Advisory Board;
6. Declined to appropriate funds for a general mailing by the Nursing Home Liaison Subcommittee inviting members to a meeting to discuss Responsibilities of a Medical Director of Nursing Homes, Extended Care Facilities, etc. It suggested that such a notice could be included in another general mailing and the date coordinated to accomplish this objective;
7. Authorized an expenditure of up to $200, if needed, to finance the Fourth Annual Seminar on the Medical Aspects of Sports;
8. Adopted Responsibilities of a Medical Director of Nursing Homes, Extended Care Facilities, etc., as recommended by the Subcommittee on Nursing Home Liaison;
9. Recognized the retirement of Ellen D. Gordon, who has been with the Faculty for 35 years.

Genetic and Environmental Determinants of Chronic Obstructive Pulmonary Disease

Prevalence of abnormalities of pulmonary function among 156 relatives of 61 patients with chronic obstructive lung disease was found to be significantly higher than among 86 controls. Pulmonary impairment was more severe among smokers.

Recent reports have emphasized the association between a marked deficiency of a serum glycoprotein, alpha$_1$ antitrypsin, and chronic obstructive pulmonary disease. Since this protein deficiency is genetically determined, the question arises whether it accounts for all familial emphysema.

The present study was undertaken to investigate the prevalence of obstructive pulmonary disease and its relationship to alpha$_1$-antitrypsin deficiency among relatives of patients with chronic obstructive pulmonary disease. In addition, a group of spouses of these relatives was studied to provide a control group.

In all, 203 persons were studied, including 61 patients—designated in this study as index cases—156 first-degree relatives (siblings, parent, son, daughter), and 86 spouses of these relatives. All were at least 21 years old and lived within a 100-mile radius of each other.

Prevalence of Disease

Approximately 23% of the relatives were found to have obstructive pulmonary disease as compared with 9% of the controls.

Severe abnormalities were seven times more prevalent in the relatives than in the controls (8% to 1%). However, since the numbers were small, the level of statistical significance was just 5% (chi square).

Of the 61 family fragments in this study, 22 families had at least one person other than the index case who was found to have chronic pulmonary disease. Twelve families had one other afflicted relative; eight families had two; one family had three, and another family had five.

There were a total of 58 afflicted family members, including the 22 index cases.

Antitrypsin Levels

Alpha$_1$-antitrypsin levels were measured in 41 of these afflicted subjects according to the method described by Briscoe and associates. The only deviation from this method was that the optical density was read at 410 after the reaction was stopped with 0.1 N hydrochloric acid.

Serum level of alpha$_1$-antitrypsin activity has been used to identify persons with severe deficiency of the glycoprotein (homozygotes) that results from two defective genes, or persons with a lesser, or intermediate deficiency (heterozygotes) that results from a single defective gene.

In the homozygous genotype, the antitryptic level is very low (0 to 400μ/100 ml serum). In heterozygous genotypes it is usually between 401 to 900μ/100 ml.

In all 41 of those tested, alpha$_1$-antitrypsin levels exceeded the maximum homozygous level. In only

Roger K. Larson, MD, Martin L. Barman, MD, Friedrich Kueppers, MD, and H. Hugh Fudenberg, MD.
Annals of Internal Medicine, *May 1970 (Vol. 72, No. 5).*

two subjects did it fall within the heterozygous range.

Furthermore, only 10% of 91 relatives tested fell within the heterozygous range while 16% of 70 controls did.

Even more surprising, perhaps, is the fact that only 7% of 96 patients with mild to severe chronic obstructive pulmonary disease tested (9% of 67 with severe disease) fell within the heterozygous range while 15% of 118 normal subjects did.

Role of Heredity

The possibility that emphysema may be the result of hereditary factors was suggested as long ago as 1845. The present study gives further support to this concept.

In this study, however, abnormal relatives were found in only 22 of the 61 family fragments. Moreover, two thirds of the abnormals were found in just ten family fragments. From this data it is not possible to conclude that all chronic obstructive pulmonary disease is genetically determined.

At first glance the study would appear to suggest that heredity plays a more prominent role in women. A much higher percentage of abnormalities was found among smoking female relatives (29%) than the controls (0%). Such a disparity was not detected between smoking male relatives and controls. The percentage of smoking male relatives with abnormal pulmonary findings (25%) was close to the percentage for the smoking male controls (22%).

However, on closer scrutiny, 18% of male smoker relatives were classified as severe as compared with 3% for the comparable controls (significant at the 5% level). Thus, the relatively equal prevalence is somewhat specious and tends to mask the marked qualitative difference in severity.

The single-gene abnormality of alpha$_1$-antitrypsin deficiency has been reported to be associated with a very high prevalence of chronic obstructive pulmonary disease. This curious association was discovered by serendipity and has not been adequately explained as yet, although some hypotheses have been proposed in the literature. The present study suggests that familial chronic pulmonary disease may occur with or without alpha$_1$-antitrypsin deficiency and that the latter is less common.

In view of recent studies, however, showing an elevation of alpha$_1$-antitrypsin levels in heterozygotes into the normal range in the presence of infection, it is possible that some heterozygotes could have been missed in the present study. Additional studies will be necessary to clarify this point.

Although an attempt was made to subclassify the index cases and abnormal relatives as to type of disease, it became readily apparent that the vast majority fell into the broad category of the bronchitis-emphysema syndrome. Onset of disease with accompanying dyspnea occurred early in life for many. Furthermore, family histories of the afflicted patients revealed that females were affected as commonly as males.

Role of Smoking

Although an analysis of the effects of smoking on pulmonary function was not the primary purpose of this study, it was apparent that smoking was significantly associated with functional abnormalities. The prevalence of abnormality was lowest (3%) in nonsmoking controls. The prevalence was highest in the 107 relatives who smoked (27%). Similar patterns, falling between the two extremes, were detected in nonsmoking relatives and smoking controls.

Thus, it appears that heredity and the environmental factor of smoking may be co-determinants, with each contributing equally to the likelihood of the development of chronic obstructive pulmonary disease.

Baltimore City Medical Society

Board of Directors Meets

The Board of Directors of the Baltimore City Medical Society met at 1211 Cathedral Street at 4:35 PM on August 11, 1970. The meeting was called to order by the President, John N. Classen, MD. Present at this meeting were: Drs. Classen, F. K. Adams, E. F. Cotter, J. E. Levi, R. L. London, P. F. Wagley, and R. E. Farber. The minutes of the June 2, 1970 meeting were approved as distributed.

The first item on the agenda was a discussion of the Peer Review Committee for the Baltimore City Medical Society. Dr. Classen stated that he was still trying to find the right person to be chairman of this committee and asked for further suggestions.

Since the Board of Medical Examiners intends to use the national *FLEX* examinations beginning this December, the meeting hall of the Medical and Chirurgical Faculty building will be furnished with desk chairs. This will necessitate the use of these seats for the December meeting since adequate time for replacement of the usual furniture will not be available.

The Board of Directors then discussed the recent salmonella outbreak at Gould Convalesarium. Dr. Farber stated that the concern was the seeming delay in reporting the epidemic to the health department and expressed hope that something could be done to urge physicians and nursing homes to practice better reporting procedures. Neil Solomon, MD, PhD, has written a letter to Dr. Farber instructing him to turn over all information concerning this matter to the Medical and Chirurgical Faculty for investigation. A committee has been set up by Med-Chi for this purpose. There was some discussion about this procedure and it was the consensus of the Board that since the nursing home was in the city, an investigation should properly be carried out by the Professional Relations Committee of the City Society.

A suggestion was made that a resolution be formulated and presented to the Med-Chi House of Delegates suggesting to the Governor that prior to making appointments which concern the health of the people in the State of Maryland, consultation should be held with the medical profession. They could then submit a list of candidates qualified for the position.

Dr. Levi stated that he felt that if there were any wrongdoing on the part of the physicians at the nursing home it should be investigated by the City Society and proper action taken. But he warned that the Society also had the responsibility of protecting the physicians and should not allow them to become "scapegoats" if innocent. Since Dr. Classen plans to meet with John Schaefer, MD, who is chairman of the Ad Hoc Committee set up by Med-Chi to investigate the matter, it was suggested that he bring this subject up for discussion at the future meetings of the Medical and Chirurgical Faculty.

The Board voted to request the Medical and Chirurgical Faculty to grant Emeritus Membership to Robert B. Mitchell, MD.

Next, the composition of the Regional Planning Council was discussed. Dr. Farber informed those present that the law requires that 51% of the membership of the Council be made up of consumers. This leaves few places for professionals. There are numerous committees which advise the Planning Council. The Society is represented on two of these by Frank Kaltreider, MD, and Harry F. Klinefelter, MD. Dr. Farber suggested that if there were any specific items which the Society would be interested in having clarified or discussed, William Hiscock, Director of Health Planning for the Regional Planning Council, should be contacted.

Further correspondence about the Maryland Artificial Kidney Treatment Fund was reported by Dr. Wagley who stated that a letter had been received by Gordon Walker, MD, from the husband of a former patient under this program. As soon as Dr. Walker returns from vacation, this matter will be considered further.

The next item on the agenda was a report from

the Committee to Develop Standard Physical Examination Forms for Campers. A report was submitted from this committee suggesting the use of the *Supplemental Form Health Memorandum for School and Camp*, printed by the Academy of Pediatrics. It was felt, however, that this matter of form revision did not solve the problem, since many children in the inner city do not have a physician or any means of having the form completed. It was agreed that a letter be written to Conrad Acton, MD, chairman of the Boy Scout Committee, requesting the committee to investigate the possibility of having members of the Society volunteer to provide physical examinations to indigent children prior to attending camp.

A discussion of a newsletter printed by the "People's Free Medical Clinic" followed. Dr. Wagley suggested that C. Lee Randol, MD, be contacted regarding several statements in this newsletter which the Board felt were disparaging to present social order and to the medical profession.

The final item on the agenda was a report concerning the MUND project. Apparently the MUND project has run into difficulty in obtaining funds for planning from the Office of Economic Opportunity. No final decision has been made as to whether or not funds will be forthcoming from the federal government and, therefore, no action can be taken on this project at the present time.

The meeting was adjourned at 6:45 PM.

The Board of Directors of the Baltimore City Medical Society met on September 8, 1970 at 4:30 PM at 1211 Cathedral Street. The meeting was called to order by John N. Classen, MD, president. Those members present were: Drs. J. N. Classen, J. T. Chissell, A. E. Cocco, E. F. Cotter, R. B. Goldstein, J. R. Karns, W. K. Mansfield, P. F. Wagley and R. E. Farber. The minutes of the August 11, 1970 meeting were approved as distributed. A list of present committee members and vacant offices in Med-Chi and BCMS for 1971 was distributed to members of the Board, Delegates, and alternates, with the request that suggestions for committee appointments and nominations for the forthcoming year be submitted.

The first item on the agenda was related to the Maryland Artificial Kidney Treatment Fund. Dr. Wagley reported that a letter had been received from the husband of a former patient of the responsible physician but that nothing in the letter could be considered as evidence of unethical or illegal procedures on the part of the physician. Dr. Walker has informed him that there are several other letters in the process of being distributed but the committee has not met again to consider these.

The Board of Directors met with the Delegates of the Baltimore City Medical Society who were to attend the semiannual meeting of the Board of Delegates of the Maryland and Chirurgical Faculty. The Board recommended that the Delegates support Resolution 2S/70 which calls for the Professional Medical Services of Med-Chi to gather and maintain current information concerning the usual and customary fees of physicians, and also suggested that information concerning the relative cost of treating patients be maintained.

The Board felt that the intent of Resolution 3S/70 was unclear and agreed with the recommendation of the Reference Committee that this be referred to the Med-Chi Legislative Committee for consideration and investigation.

The third matter discussed with the Delegates concerned the report of a special committee set up to consider the value of continuation of the MEDIC NETWORK. The committee submitted the recommendation that the Network be continued and that each active member of Med-Chi be assessed $5 each year for the purpose of financing MEDIC and other educational ventures. After some discussion, it was agreed to favor this recommendation even though the network is not used extensively by city physicians. It was also suggested that means be explored for generating more interest in the programs which are considered excellent in quality.

The next item on the agenda was the discussion of the scholarship fund. Dr. Classen stated that Read's Drug Company has offered to donate a sum of money to the Baltimore City Medical Society Scholarship Fund if such a fund is approved by the Society. In order to get this money, the Society would be expected to acknowledge its receipt to the physicians to whom Read's usually sends presents at Christmas. Several persons present felt that a letter to physicians informing them of a donation from Read's might be interpreted as an endorsement of Read's Drug Stores. Dr. Wagley pointed out that since the Society has not voted on the scholarship proposal yet, Nelson Warfield of Read's should be informed that money could not be accepted at this time for that specific purpose. It was agreed that Mr. Warfield would be contacted for more definite information as to the amount of money involved and exactly how he wished the acknowledgements sent.

Dr. Goldstein read the following proposed amendments to the BCMS Bylaws to be presented at the October 1970 meeting.

AMENDMENT 1

Amend Article IX, after Section 6, by inserting the following new Section 7 (the remaining section being automatically renumbered):

CAPS PORTION TO BE ADDED

SECTION 7. A FINANCE COMMITTEE SHALL BE COMPOSED OF THE TREASURER AND THREE MEMBERS, ONE OF WHOM SHALL BE APPOINTED ANNUALLY BY THE PRESIDENT FROM THE CURRENT MEMBERS OF THE BOARD OF DIRECTORS FOR A THREE YEAR TERM. IT

SHALL BE THE DUTY OF THIS COMMITTEE TO MEET DURING THE FIRST WEEK OF JANUARY AND AT SUCH OTHER TIMES AS SEEM REQUIRED, TO FRAME RECOMMENDATIONS FOR ACTION BY THE BOARD OF DIRECTORS AS TO THE DISPOSITION, BY INVESTMENT OR OTHERWISE, OF ANY ACCUMULATED EXCESS OF INCOME OVER EXPENDITURES.

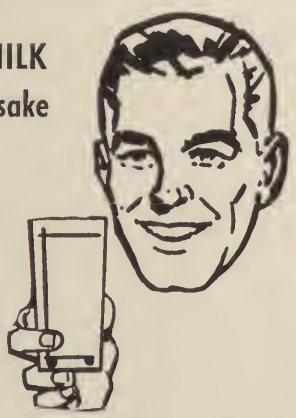
AMENDMENT 2

Amend Article V, Section 1.

CAPS PORTION TO BE ADDED

New Provision

Section 1. The officers of the Society shall be a president, a president-elect, a vice-president, a secretary, a treasurer, and six directors. These officers shall perform the duties prescribed by these Bylaws and the parliamentary authority of the Society. IT SHALL BE EXPECTED THAT THESE OFFICERS, AND THE DELEGATES AND ALTERNATES TO THE HOUSE OF DELEGATES OF THE MEDICAL AND CHIRURGICAL FACULTY OF THE STATE OF MARYLAND, WILL INCLUDE IN THE RESPONSIBILITIES OF THEIR OFFICE **ATTENDANCE AT ALL MEETINGS** OF THE SOCIETY.



Dr. Classen urged the Delegates and alternates to make every effort to attend the meetings of the Society so that a true representation of the Society could be present when important issues are presented and voted upon. The delegates and alternates were then thanked for attending and the Board resumed its regular meeting.

The Med-Chi Liaison Committee has written to each component requesting that the matter of physicians signing out and leaving a recorded message telling patients to go to hospital emergency rooms for treatment be considered. There were several questions as to whether or not this was abandonment of a patient. It was agreed to ask the Liaison Committee for a ruling from the Faculty attorney as to the legalities involved and to contact Carroll County Medical Society and Wicomico County Medical Society for information as to how they have handled the problem in their community.

The last item on the agenda was consideration of a Peer Review Committee for the Baltimore City Medical Society. Katherine Borkovich, MD, has been requested by the Board to chair the Baltimore City Medical Society Peer Review Committee but as of this meeting she had not responded to this request. Dr. Cocco stated that the task of Peer Review throughout the state would require that the component societies formulate active Peer Review Committees. It is possible that Baltimore city may need more than one such committee. These matters were discussed at a meeting of the Med-Chi Peer Review Committee on September 9.

The meeting was adjourned at 6:20 PM.

Hemophilia Control

A highly purified concentrate of antihemophilic factor (AHF), for the prevention or control of bleeding episodes in victims of hemophilia, has been developed by the American Red Cross under a research contract awarded by the National Blood Resource Program of the National Heart Institute.

The new concentrate contains some 40 to 100 times as much AHF as does an equal volume of whole blood or plasma. It promises to be a major advance in the medical management of hemophilia A, by far the most common of the hereditary bleeding diseases that, in the aggregate, afflict an estimated 100,000 Americans.

The concentrate is prepared from blood plasma by a polyethylene glycol precipitation technique developed by Alan Johnson, of the American Red Cross Laboratory at New York Medical Center, New York. The technique is relatively simple and is suitable for extracting the AHF from large batches of plasma. The AHF free plasma can subsequently be processed to yield albumin, gamma globulin, and other plasma proteins for important uses in research and clinical medicine.

Family Doctor Making More—Working More

A new survey shows that U.S. family physicians have increased their income since Medicare and Medicaid began in 1966, but only by slightly over 25% for the highest percentage-of-increase group. At the same time, this group, working an average of 59 hours a week in 1965, increased the number of hours worked a week by 15% and the number of patient visits by the same percentage.

The survey results reflect income and related practice data of 1,000 members of the American Academy of General Practice, the national association of family physicians. Respondents represent a random cross-section of the United States. They were requested not to sign the survey forms or give any identifying information, and advised that no attempt would be made to monitor postmarks or relate responses to the mailing list in any way.

The purpose of the survey was to find out how much family physicians had benefited financially from the two big federal health programs. A recent national publication had suggested there had been increases in earnings of as high as 71% since Medicare. This survey does show a rise in net earnings in all groups (categorized by hours worked per week). These percentage increases range from 5.3% for physicians working 41 to 45 hours a week, to 26.3% for the highest group in terms of percentage increase—physicians who work 66 to 70 hours a week.

Significantly, the survey shows that while number of hours worked a week and number of patient visits a week have gone up considerably for many of these physicians, the time spent for each patient visit has remained about the same. For example, the number of patients seen an hour is three and a fraction in all categories now, and was just about the same in 1965. This data indicates approximately 18 minutes for each patient visit in all categories.

The most significant general conclusion from the survey would appear to be that the more a physician works, the more he can earn, but not in direct ratio to additional hours worked.

This is illustrated by the net increase in earnings per patient visit since 1965. For all physicians working between 41 and 65 hours a week, this increase is stabilized at an average of about 44 cents. It drops off sharply to 30 cents in the 66 to 70 hour-per-week group, and plummets to a 14 cent increase per patient visit for the more than 70 hour-per-week group.

American Academy of General Practice

The Effectiveness of Vocational Evaluation in the Rehabilitation Process

CHARLES SMOLKIN, MEd, AGS
Chief, Vocational Rehabilitation Services
Department of Rehabilitation Medicine
Sinai Hospital
Baltimore

JUSTINA TWILLEY
Vocational Evaluator
Department of Rehabilitation Medicine
Sinai Hospital
Baltimore

B. STANLEY COHEN, MD
Chief
Department of Rehabilitation Medicine
Sinai Hospital
Baltimore

Vocational Evaluation was conceived at the Department of Rehabilitation Medicine of Sinai Hospital, Baltimore, on January 13, 1969, in conjunction with, and in addition to, the existing rehabilitation team (medical, social, psychological, speech and hearing, physical therapy and occupational therapy). The philosophy of the Vocational Evaluation program was that the patient-client would be given the primary responsibility in the exploration of new vocational areas. The client would then be the active participant having available to him the total rehabilitation team in case of physical, medical, psychological, or social barriers to the completion of the vocational process.

The Vocational Evaluation program has three plateaus. The first week of the program includes group psychological testing. The emphasis is placed on nonverbal tests, with the knowledge and understanding that all tests have limitations beyond the norm with a disabled population. No predictions are made directly from the tests. The tests are used as guidelines in selecting work-sample areas. The client's expressed interests are another primary factor in planning an individualized program of vocational exploration for each participant.

The second plane of Vocational Evaluation involves the exploration of appropriate work-sample areas. The TOWER system of work-samples published by the *Institute for the Crippled and Disabled* is the bulwark of this area. Other work-samples have been developed at Sinai Hospital and by Julian Nadolsky when he was the vocational evaluation director at the Baltimore League for Crippled Children and Adults.

Appropriate tryouts in hospital work areas represent the third level of Vocational Evaluation. The advantage of having a vocational program within a hospital complex is that a multitude of work areas exist (ie, laundry room, kitchen, print shop, store room, accounting department, central supply, and reception desks).

During the total process, major emphasis is placed on psychological variables. The client's self-concept and his attitude toward the requirements of work are evaluated. It is the belief of the authors that vocational success is dependent upon more than skill and intelligence.

For less than $30 thousand, 14 clients have been guided into competitive placement, two into sheltered employment, and 16 more are receiving additional

services before placement. More than 80 additional clients have completed the program and are included in the cost, but they have not been out of evaluation long enough to be considered in the follow-up data. However, the cost versus the productivity of this program is impressive.

The cooperation and support of the counselors of the Division of Vocational Rehabilitation of the State of Maryland has been important in the success of the program. The advice and guidance of John C. Kelly, liaison counselor of the Division at Sinai Hospital has, in particular, been most valuable.

Progress Report on Vocational Evaluation—January 1969 to December 1969

	Number of clients	Percentage of total
1. Handicap served		
Intellectual disabilities	18	16%
Physical disabilities	58	53%
Psychological and psychiatric disabilities	34	31%
TOTAL	110	100%
2. Referral service		
Baltimore city	75	68%
Baltimore County	31	28%
Outside metropolitan area	4	4%
TOTAL	110	100%

	Not followed	Followed	Successful	Unsuccessful
3. Disposition of recommendations				
Direct job placement	1	6	6	
Vocational training	1	5	3	
Continued education	1	2		
Workshop	7	5	2	1
On-the-job training	1	3	2	
Personal adjustment training	2	4	2	1
Psychological and psychiatric services	1	3		
Volunteer work		2		
Vocationally infeasible		3		
Work-study program		1	1	
TOTAL	14	34	16	2

Analysis of Program

A client must have completed Vocational Evaluation six months prior to follow-up. Vocational success is considered when a client has been employed successfully for a period of three months in a recommended or related area.

Forty-eight clients were eligible for follow-up as of December 1, 1969. Seventy-one percent (34) of the recommendations were followed.

Of the recommendations followed, conclusions can be drawn for 18 clients. Eighty-nine percent (16) of the clients are successfully employed in competitive or sheltered industry.

Summary of an Interesting Case

A 17-year-old man with an amputation below his right elbow, resulting from a farming accident, was referred for Vocational Evaluation in March 1969. He had been unable to function in school because he was ridiculed by his peer group about his prosthesis. He subsequently dropped out of school and refused to use his prosthesis.

During the evaluation process, it became obvious to this young man that he could become a much more productive worker by using his prosthesis. Therefore, he consented to wear it and learn to increase his competency in using it. Training was provided by a team occupational therapist with specialized training in upper extremity prosthetics. Because of this team approach, he was able to function adequately in the carpentry, machinery operation and electronics areas.

He was also given an on-the-job tryout with the hospital ground crew. Because of his rural farming background, he preferred this outdoor environment.

The rehabilitation counselor creatively combined these recommendations and placed the client as an outdoor carpenter's apprentice. For seven months, he has been working at this job earning $2.58 an hour. He is now a married man independently supporting himself and his wife.

The girth control pill

Tepanil® Ten-tab

(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic cardiovascular effects reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythema. Gastraintestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Baltimore City health department

Geriatric Evaluation Service Progress

In its first full year of operation, the City Health Department's Geriatric Service has amply demonstrated its value and need in the Baltimore community. From a total of 131 elderly persons age 65 or over for whom mental hospitalization was in the offing, some 93 of them, or 70%, were aided by the project and were able to continue in the community, either at home, or in general medical or other facilities.

According to Mrs. Mary Guth, project director, 51 elderly persons were given help through community resources so that they could be maintained at home. This followed a medical, psychiatric, and social evaluation, which every accepted referral undergoes.

Thirty other elderly people were admitted to nursing homes, and another four, who were considered management problems, were continued at the nursing homes. Six were admitted to general hospitals for medical reasons, including one admission to a psychiatric unit. Two persons were accepted at boarding homes.

Only 38 patients (or 29% of the total number of patients evaluated) had to be admitted to mental hospitals. Of these, 33 were admitted to state mental hospitals and five were admitted to private psychiatric hospitals.

Fifty-eight persons who did not meet the criteria for the geriatric service were provided with information and referral according to their needs.

Another evidence of community need, according to Mrs. Guth, is indicated by a change in the source of referral. When the project was initiated, referrals came only from the preadmission services of state mental hospitals. In recent months, as the project's services became better known, referrals were increasingly made by private physicians or other individuals, or by community agencies. The Geriatric Evaluation Service now processes about equal numbers of referrals from the mental hospitals and from the community.

The Geriatric Evaluation Service has a budget for the current fiscal year of $64,717, from funds received on an approximately 50-50 matching basis through Title III of the Older Americans Act and a Community Mental Health Demonstration Grant of the Maryland State Department of Mental Hygiene.

The city's successful pilot program suggests to city and state health administrators the need for a state policy and appropriate funding for mandatory evaluation of all geriatric patients for whom mental hospital admission is pending, a proposal now under consideration by the Secretary of Health and Mental Hygiene. However, the needs of the elderly are many and complex and the aging process further complicates their care. An effective geriatric service should not only evaluate the elderly person's social, physical, psychological, and financial problems, but be able to ameliorate them so that the aged member of our community can continue to function in society. Mrs. Guth and her small staff of two part-time professionals and a full-time secretary, with the help of many individuals and community agencies, have shown that it can be done.

The Geriatric Evaluation Service is located at the Good Samaritan Hospital. The staff includes Mrs. Guth, who doubles as a psychiatric social worker and is involved in direct services to patients; Miriam S. Van Gelder, MD, formerly Chief of the Bureau of Special Health Services, Medical Care, in the State Department of Health; Mrs. Pansy K. Schmidt, psychiatric social worker, formerly with the city's Psychiatric Day Center; and Mrs. Judy Nawrozki, secretary. Joy Joffe, MD, internist, psychiatrist, and specialist in geriatrics, serves as a consultant. Three new positions which have yet to be filled have been included in the new budget effective September 1. These are two full-time psychiatric social workers, one of whom may be a public health nurse preferably with psychiatric experience, and a part-time psychiatrist or other physician with an interest in geriatrics.

MIRIAM L. COHEN, MD, EDITOR

A Service of the Heart Association of Maryland

the heart page

Treatment of Hyperlipidemia

SIMEON MARGOLIS, MD
Department of Medicine
The Johns Hopkins University School of Medicine
Baltimore

The aim in the treatment of hyperlipidemia is the reduction of serum lipid levels in order to prevent premature vascular disease in Types II, III, and IV and acute pancreatitis in Types I, IV, and V. The problems in management include the determination of which patients require therapy and the choice of diet and drug measures.

Three factors are of prime importance in the selection of patients for therapeutic efforts to prevent coronary heart disease. The decision is based not only upon the degree of hyperlipidemia, but also upon the age of the patient and the presence or absence of other "risk factors". The younger the patient, the lower the threshold for the institution of treatment, because in young subjects: (1) the association is stronger between hyperlipidemia and coronary heart disease; (2) therapeutic measures more often lower lipid levels; and (3) reduction of serum cholesterol is more effective in preventing new cardiac events. In contrast, there is no evidence that control of serum lipids benefits patients older than 60.

Thus, when severe hyperlipidemia is present, treatment is advocated for all patients less than 60 years old. When modest elevations of serum lipids are found, however, no hard and fast rules can be given for the selection of patients for treatment. All children and young adults with elevated serum lipids should be treated, especially if there is a family history of hyperlipidemia or early coronary heart disease. In fact, it is reasonable to institute dietary restrictions, at least, in young subjects with such a family history (and perhaps those with significant hypertension) even if their serum cholesterol falls within the normal range for our population. This course of action can be justified by several studies which indicate that, even at relatively low cholesterol levels, the risk of coronary heart disease rises as the serum cholesterol concentration increases. In older patients, treatment is advised in the presence of more severe lipidemia, or when other "risk factors" are prominent or overt coronary heart disease is present.

Detection of secondary hyperlipidemia is essential, since therapy is directed against the underlying disease state in these patients. Accurate typing of the primary hyperlipidemias is important because proper treatment varies with the type of lipid abnormality. Accordingly, specific therapeutic measures will be considered separately for each type of hyperlipidemia. In all hyperlipidemic patients, however, dietary management is the keystone of therapy. Drugs are employed, usually in combination with dietary measures, only when the diet is not sufficiently effective alone or cannot be followed by the patient. A handbook for physicians, entitled *The Dietary Management of Hyperlipoproteinemia,* is available on request from the Office of Heart Information, National Institutes of Health, Bethesda, Md.

It is difficult to predict the effectiveness of dietary or pharmacologic agents in any given patient. Therapeutic measures usually succeed within six to eight weeks or not at all. If dietary measures fail over such a time period, patients should be given a spe-

cific drug for about two months. If serum lipids do not fall, the initial drug should be discontinued and another tried in a similar manner. Reduction in serum cholesterol may be achieved in some patients only through the combined use of several drugs and dietary measures. Since patients should not be maintained for a protracted period on an ineffective drug or combination of drugs, there is a clear need for adequate baseline lipid values before institution of therapy.

Type I: Patients with Type I disease have exhibited no increased risk of premature vascular disease, but they suffer from recurrent bouts of abdominal pain, probably due to pancreatitis. The goal of therapy, then, is to reduce dietary fat sufficiently to prevent episodes of abdominal pain. This can be accomplished by restricting fat intake to about 30 gm daily. The diet can be made more palatable by the addition of triglycerides which contain medium-chain length fatty acids. Except for avoidance of alcohol, there are no other restrictions in these patients. To date, pharmacologic agents have not reduced serum triglycerides in this disorder.

Type II: Dietary management involves reduction of cholesterol intake to less than 300 mg a day and the substitution of polyunsaturated (P) for saturated (S) fats to achieve (P/S) ratio of approximately two (see Table 1). Outlined below is a simple and effective dietary program. All meats (except the leanest), dairy products (except cottage cheese or skimmed milk), egg yolks, and most commercial sweet bakery goods are replaced by seafood, chicken, and turkey (especially without skins), nonhydrogenated vegetable oil margarines, shortenings, cooking and salad oils (labels must be read carefully). If eggs, brains, sweetbreads, butter, and fish roe are eliminated and meats, kidneys, liver, and shellfish are modestly reduced in amount, dietary cholesterol intake poses no problem.

Table 1: Dietary Treatment of Hyperlipidemia

Type of Hyperlipidemia	Total Calories	Distribution of calories		Restriction of particular fats	
		Fat	Carbohydrate	Cholesterol	Saturated Fats
I	—	25 to 35g	—	—	—
II	—	—	—	300 mg	P/S = 2
III	Reduce to and maintain ideal body weight	40% of calories	40% of calories Eliminate free sugar	300 mg	Reduce saturated fat intake
IV	Reduce to and maintain ideal body weight	40% of calories	40% of calories Eliminate free sugar	300 to 500 mg	Reduce saturated fat intake
V	Reduce to and maintain ideal body weight	25% to 30% of calories	50% of calories Eliminate free sugar	—	—

— Indicates no restriction

A reduction of 10% to 20% in serum cholesterol can be expected in most subjects within one month of such dietary modification. The diet is particularly effective in subjects with acquired hypercholesterolemia and in children who are heterozygous for Type II disease. In adults with familial Type II, dietary measures produce small reductions of serum cholesterol and must be combined with drug therapy. The drugs that have been used to treat hypercholesterolemia include cholestyramine, clofibrate, D-thyroxine, nicotinic acid, and sitosterols.

Cholestyramine, 16 to 32 gm daily, is presently the most effective agent for lowering serum cholesterol levels. However, many patients object to its taste and odor. In addition, constipation is a troublesome side effect and high doses may produce steatorrhea.

Although more effective in the treatment of hypertriglyceridemia, clofibrate *(Atromid-S)* lowers serum cholesterol by 10% to 15% in some patients, and by considerably more in an occasional patient with a Type II disorder.

D-thyroxine *(Choloxin)*, 4 to 8 mg daily, reduces serum cholesterol levels by an average of about 15%. Its therapeutic value may be outweighed by side effects which include diarrhea, nervousness, and angina pectoris. D-thyroxine is contraindicated in patients with angina pectoris, a history of myocardial infarction, or hypertension. This drug also potentiates the effects of oral anticoagulants. Accordingly, a cautious trial of D-thyroxine is recommended only after other measures prove ineffective.

Sitosterols *(Cytellin)*, plant sterols which are poorly absorbed and tend to inhibit cholesterol absorption, promote a modest reduction of serum cholesterol. This agent is essentially free of adverse effects, but its effectiveness is slight.

Intravenous infusion of low molecular weight dextran produces a dramatic fall in serum cholesterol which may persist for 6 to 14 days. Although it

has been used extensively in the Baltimore area, such treatment requires frequent infusions and cannot be recommended until its safety and long-term effectiveness are better documented. Finally, ileal bypass may be considered in patients whose marked hypercholesterolemia is unresponsive to the measures outlined above.

Type III: As indicated in Table 1, the main elements in dietary management are maintenance of ideal body weight, control of carbohydrate intake (especially free sugar and foods containing concentrated sweets), and restriction of dietary cholesterol. Clofibrate, 2 gm daily, is the drug of choice in this disorder. When combined with dietary measures, this agent is highly effective in lowering serum lipid levels in patients with Type III hyperlipidemia. In patients receiving warfarin anticoagulants, clofibrate may prolong the prothrombin time so that a reduction in the anticoagulant dose is usually necessary. The drug rarely produces side effects, but weight gain, acute myositis, mild nausea or diarrhea, or a skin rash may occur in a few patients.

Type IV: Dietary management is almost identical with that of Type III (see Table 1). Clofibrate is the most effective drug, but serum triglycerides respond less in Type IV than in Type III. Nicotinic acid decreases triglycerides in Type IV disease and also lowers serum cholesterol in some patients with Type II disorder. The daily dose is increased over several weeks from 1 gm to 3 to 6 gm. At this dose, nicotinic acid often has prominent side effects which include flushing, pruritus, gastrointestinal symptoms, abnormal liver function tests, hyperglycemia, and hyperuricemia.

Type V: Dietary measures (see Table 1) include maintenance of ideal weight, and restriction of fat intake to 25% to 30% of calories and of carbohydrate intake to 50% of total calories. More severe fat restriction may be required to prevent pancreatitis in some patients. Alcohol should be avoided since it may produce marked elevations in serum triglyceride levels. Clofibrate may reduce serum triglyceride levels in some patients with Type V. Successful control of serum triglycerides and prevention of acute pancreatitis was achieved in most women in a small series with the use of the progestational agent norethindrone acetate, 5 mg daily.

Many patients with Type IV have some degree of glucose intolerance. In these subjects, oral hypoglycemic agents or insulin may help to control the hypertriglyceridemia. When insulin deficiency is profound, Type I or Type V hyperlipidemia may occur. Insulin treatment will rapidly clear the chylomicronemia in such patients.

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, MARYLAND STATE MEDICAL JOURNAL, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a maximum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the JOURNAL. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with JOURNAL style.

Statements made or opinions expressed by any contributor in any article or feature published in the JOURNAL are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

Care of the Aged

NEIL SOLOMON, MD, PhD
Secretary of Health and Mental Hygiene

MATTHEW TAYBACK, ScD
Assistant Secretary of Health and Mental Hygiene and Scientific Affairs

Recently, in a licensed nursing home in Baltimore city, an explosive outbreak of salmonellosis resulted in gastrointestinal disease in 108 of 140 patients. Among the 108 ill patients, there were 25 deaths. All afflicted were elderly persons. This outbreak prompted us to consider some of the major issues concerned with the care of the aged which require urgent attention both at federal and local levels.

The medical and health care problems of the aged are prime issues for public concern. However, they have yet to be adequately recognized in terms of effective management. In Maryland, 13,000 beds are occupied by aged patients in nursing homes, while another 2,000 aged patients are housed in the state mental hospitals. In addition, not less than 1,000 chronic disease hospital beds are set aside for subacute and rehabilitative care of the disabled aged. Here, then, are 16,000 beds and associated facilities occupied by aged patients requiring long-term care.

By contrast, we have a total of approximately 12,000 beds in Maryland's general hospitals. It would not be an exaggeration to state that 30% of these beds are occupied by our aged citizens. Note, then, the overwhelming significance of the aged in the medical affairs of our community. Has this situation always existed and, if so, what is unique about it?

The preeminent position of the medical care problems of the aged is relatively new. The aging of the population has been going on for several decades. But it is only recently, and particularly since the establishment of the medicare program, that the public has become a dominant factor in meeting the urgent medical needs of the aged.

While the public concern with and commitment to medical problems of the aged has increased enormously, the concept of structuring this concern into an effective and efficient effort has received inadequate attention. For example, an additional 5,000 nursing home beds have been added in Maryland in the past six years. However, a home health service program to treat these additional patients has only expanded 40%. Other methods of caring for the aged have not been significantly developed.

The relationship among the resources provided by the physician and other community sources of care, the acute hospital, the chronic disease hospital, the mental hospital, and the nursing home has been left to chance. This is indeed a sad picture for our elderly citizens. The most expensive form of care, permanent institutionalization, is becoming the major investment in treating the aged.

With these concepts in mind, we in Maryland plan to recognize the medical and health problems of the aged with the same sense of urgency afforded mental health and environmental health problems. A distinctive agency to deal with the medical services for the aged will be created. This agency will be concerned with the:

(1) Management of the chronic disease hospitals within the jurisdiction of the state

(2) Development and enforcement of standards of care in nursing homes

Prepared for presentation to U.S. Senate Subcommittee on Long-Term Care, August 19, 1970, Washingon, D. C.

(3) Vigorous promotion of home health service programs and their use by practicing physicians

(4) Creation of options to permanent institutionalization such as day care and short-term care in nursing homes

(5) Establishment of regional geriatric screening centers where elderly patients proposed for admission to state mental hospitals or to nursing homes may be evaluated and referred for the most appropriate treatment

(6) Evaluation of services rendered and expenditures made under the medicare program

The personnel for the proposed agency are presently found in different units within our department. They will be organized to efficiently serve the aged. We will need additional staff to enforce standards of care in nursing homes and to be creative in seeking options to permanent institutionalization. We think that we can generate the staff and this form of programming at a state level.

However, there are several developments at the federal level which are still uncertain. Now before the Senate Finance Committee is HR 17550. Among the provisions of this bill, Section 225 would, under Medicaid (Title 19), reduce the federal matching share following 90 days of skilled nursing home care, and would drastically reduce the federal participation in the long-term care rendered in the state's mental hospitals. There is an unfortunate attitude prevailing in some federal circles that by a mixture of incentives and deterrents, unilaterally determined, a system of care can be contrived which is in the best interest of our people. What is proposed in Section 225 would be disastrous for forward thinking on problems of the care of the aged. The state would be called upon to pick up huge dollar obligations for long-term care abandoned by the federal government. In so doing, every possibility to undertake innovation and improvement would be ruined by the necessity to divert funds to replace federal failure to maintain a stable contractual relationship.

In this connection, we would also take issue with the social policy implications of recent legislation designed to categorize care in such a way that patients requiring nursing services with 24-hour nursing supervision come within the purview of medical care (Title 19). Patients requiring nursing services with less than 24-hour nursing supervision come within the purview of public assistance (welfare).

Further, we would submit that this nation cannot do justice to the medical care needs of its people by pursuing radical new departures every two years. Having launched medicaid in 1966, we are subjected to retrenchment in medically indigent coverage. We are asked to undertake an involved modification of long-term care by the insertion of the notion of intermediate care. We are now threatened with retrenchment in federal support of long-term care, while at the same time, we learn that an absolutely new program may be offered in fiscal 1972. Meanwhile, several years later, the initiation of national health insurance would appear a distinct likelihood.

We would suggest that the federal-state partnership set forth in Title 19 (medicaid) be permitted to represent the working apparatus to improve health services to the low-income population until a national uniform coverage is provided. Financial wizardry should be minimized. Professional competence in management at state levels should be maximized.

The philosophy of divide and conquer by developing independent health programs aimed at the economically disadvantaged, ie, Title V programs, OEO programs, Model Cities programs, family planning programs, etc, is a disservice. The medicaid program should be the means by which a system of care for the poor is created. In time, this system may hopefully be part of a nationwide national coverage for all of our citizens.

New Programs for the Mentally Retarded

In the past ten years, there has been a change of attitude among the citizenry of Maryland regarding the problem of mental retardation. Prior to that time, the retarded were isolated from the rest of society. They were housed in rurally located institutions and separated from the mainstream of community life. As long as their basic physical needs were met, the great majority of people were apathetic to the numerous problems created by institutionalism and the need for community programs.

However, isolation of the retarded in large institutions has only increased the cost of care and has deprived retardates of their chances for happiness and self-fulfillment. In addition, the institution has kept them from returning to the community. Generally, these large facilities have been overcrowded, costly to maintain, and lacking in programs. It is now recognized that two of the best ways to provide services for the mentally retarded are to keep as many retardates as possible in the community so that they remain an integral part of the family and society, and to drastically reduce the number of persons in residential institutions.

A Directorate of Mental Retardation was created for the purpose of unifying Maryland's programs for the retarded. The Directorate is responsible for developing, coordinating, and maintaining the programs. All services for the mentally retarded which were formerly administered under the Departments of Mental Hygiene and Health are now the responsibility of the Directorate of Mental Retardation. In addition, this new department will work closely with local and state organizations in making plans for the future.

An important part of the continuum is a good prevention program. At this time, Maryland is giving much attention to the development of such a program. Such measures as improved prenatal programs, inoculations against rubella, food programs for expectant mothers, genetic counseling for parents, and medical examinations utilizing amniocentesis will reduce the percentage of retarded individuals in the future. However, with the increasing population, the overall number of mentally retarded people will continue to rise.

Just as important as a prevention program is the continuing supportive services needed by the family. These services will help the family understand the retardate's development. The family physician, pediatrician, or local health nurse are usually the first people to be contacted when parents suspect their child is retarded. In cases where the parents do not suspect mental retardation, the responsibility of telling the parents and referring the child to the appropriate services may be handled by the local physician or the school. The Directorate of Mental Retardation, if contacted, can aid in the selection of the most appropriate resource for the child and in this way offer service to local individuals or communities.

Once the child's condition has been diagnosed and an evaluation completed, community programs must be available. These programs must meet the different ability levels and home situations of the retarded. The programs must be comprehensive enough to provide for the retardate's changing needs throughout his life.

Day care centers, which provide training for the young retardate, are being expanded every year. Through this program, the child is then able to remain in the home while attending a center to receive training in basic self-care skills such as dressing, toileting, and acceptable behavior. The family is given counseling so that they can help with the training at home.

The type of training offered by the day care centers is basically of two types. There are preschool programs for children ages three to six, focusing on self-help and social development. For those children six to sixteen, who do not fit into an established school program, training in socialization, recreation, and other activities are varied according to the retardates' abilities and needs.

Many young and older adults will continue to need services outside the home; therefore, Maryland is developing activity centers to meet these needs. To these centers, in addition to those who have grown up in day care centers, will come referrals not only from trainable classes but from residential programs.

In these programs, older retardates receive advanced training in basic self-help skills, social skills, and recreation programs. The retardate is taught to be a contributing part of the family. Prevocational programs are also offered in many activity centers so that the retardate can participate in a sheltered workshop. In short, the mentally retarded person is given the skills necessary for him to function in the home and community. If it is felt that he can function adequately in a work situation, the Department of Vocational Rehabilitation will offer work training and needed supportive services.

However, there are still those mentally retarded individuals who may need residential programs for short- or long-term care. Some may be referred because of medical problems; others may be referred because of the inability of their families to care for them.

Regional residential facilities are being constructed in Maryland. Since these centers will be near the retardates' homes, parents will be able to maintain close relationships with their children. The staff of the centers will counsel parents in the areas of care, feeding, and behavioral management. With the close proximity of the centers, it will be routine for the retardate to go home for weekends or short visits when the family and the center feels that it is appropriate. The available space can be used for short-term crisis intervention and thereby reduce the need for long-term care.

Some of the retardates who have lived in residential facilities gain enough self-care and social skills so that they no longer need the constant supervision that the residential center provides. Many others acquire vocational and social skill and are able to function in the community with minimal supervision. Halfway houses have proven to be quite successful for these people. Maryland is presently expanding its program of halfway houses and foster homes for the retarded. In this way, retardates are able to remain or return to the mainstream of community living.

Maryland has taken action which will benefit the mentally retarded. The establishment of a Directorate of Mental Retardation will provide the leadership necessary to develop programs for the mentally retarded and their families. It will also be responsible for providing or procuring services that will include prevention, parent counseling, day care, residential programs, and halfway houses.

The Care of the Mentally Subnormal

Maryland currently requires 1,098 hospital beds for the retarded in addition to available capacity to meet the state's estimated minimum need. Although construction at Rosewood, the opening of Henryton, and the transfer of 100 residents to Mt. Wilson has provided space for 930 patients since 1960, this has largely been balanced by the increased need resulting from Maryland's burgeoning population. The average size of the patient population is now 13.1% above rated bed capacity, a reduction from the 20.3% noted in 1960.

FISCAL YEAR	RATED BED CAPACITY*	AVERAGE SIZE OF PATIENT POPULATION	EXCESS PATIENTS	ESTIMATED BED NEED**	ADDITIONAL BEDS NEEDED
1960	1,873	2,254	381	3,017	1,144
1962	1,873	2,400	527	3,166	1,293
1964	2,073	2,616	543	3,353	1,280
1966	2,564	2,888	324	3,551	987
1968	2,624	3,089	465	3,692	1,068
1970	2,762	3,123	361	3,860	1,098

*** BASED ON AN AVERAGE OF 70 SQUARE FEET OF BED SPACE**
**** ONE BED FOR EVERY 1,000 ESTIMATED TOTAL STATE RESIDENTS AS RECOMMENDED BY THE AMERICAN ASSOCIATION ON MENTAL DEFICIENCY**

A new facility, opening soon near Silver Spring in the Washington metropolitan area, will have an initial capacity for 230 patients. Additional planned construction at Rosewood and in a number of smaller units in different sections of the state will provide space for approximately 700 patients. However, since the minimum bed need will increase to 4,002 by 1972, Maryland will still have an estimated deficiency of at least 310 beds when the current building program is completed.

The above data provide one indication of the need for expanded support for mental retardation programs. Other available indices* show that Maryland, in comparison with other states, ranked 23 in average expenditure for each patient, 30 in the number of beds for each 1,000 total residents, and 32 in the ratio of personnel to patients. On each of the above factors, Maryland was below the national average.

In order to meet the needs of Maryland's rapidly growing population most effectively, the department is centralizing administration of all services for the retarded. Its responsibility, in addition to maintenance and staffing of existing and planned facilities, should include: 1) research and preventive programs for reducing the incidence of mental retardation; 2) increased training and educational programs for the retarded to permit maximum development of their potential; and 3) establishment and expansion of closely coordinated community centered services such as day care centers, halfway houses, sheltered workshops, group care homes, small residential facilities, and other substitutes for hospitalization.

alcoholism section

The Maryland Alcoholism Program

MAXWELL N. WEISMAN, MD
Director, Alcoholism Control Division
State Department of Mental Hygiene
Baltimore

Dr. Weisman: The time is certainly ripe for a massive attack on alcoholism. It has come about through the work of the Senate Subcommittee on Labor and Public Welfare, the interest of Congress as a whole, and the concern of the courts. The focus that industry is beginning to place on uncovering its alcoholic employees and treating them as sick people, as well as the proliferation of community health and mental health centers throughout the country also serve to combat the problem. I cannot refrain from adding that I hope the other states will follow Maryland's lead in passing legislation similar to ours. I am indeed proud to be a Marylander in being able to point to our state's leadership in this area. I must, however, apologize for not having had time to prepare a written statement for submission to you, Senator, and the committee, and will beg your indulgence for speaking extemporaneously.

We in the state alcoholism programs throughout the nation feel strongly that the bill now pending before Congress will actually be a "Bill of Rights" for the sick and suffering alcoholics in our country. But we have often been promised beautiful programs in grandiose terms, without the opportunity to implement them effectively by realistic funding. I sincerely hope, therefore, that Congress will appropriate the money to make these dreams come true.

As one who has worked closely with treating sick patients, I know that the millions of alcoholics across the country must be tired of hearing professionals like myself hide behind the lack of funding as an excuse for our own ineptness in developing programs and our own deep lack of motivation.

I speak from sad experience. We were faced with a similar situation here in Maryland. Our Comprehensive Intoxication and Alcoholism Control Act was passed in 1968, and went into effect on July 1 of that year without a single cent appropriated toward the excellent program delineated in the law!

Without any funding during that first year, we went directly to the local health departments, to the grass roots where alcoholics live and work and get sick, and worked with them in developing the necessary programs.

In Baltimore city, in 1964, there were more than 15,000 arrests for drunkenness. In the first ten months of 1969, only slightly more than 3,000 alcoholics came in contact with the police and correctional agencies and only about 500 of them were charged with disorderly conduct. Of those remaining, one half were sent home by the police and the other half were brought to general hospitals for treatment because they were incapacitated.

Presented at a hearing before the Special Subcommittee on Alcoholism and Narcotics of the U.S. Senate's Committee on Labor and Public Welfare. The hearing was on the proposed "Comprehensive Alcohol Abuse and Alcoholism Prevention, Treatment and Rehabilitation Act of 1970". This alcoholism bill, introduced by Senator Harold Hughes of Iowa for himself and 48 fellow senators, calls for a comprehensive federal program for the prevention and treatment of alcohol abuse and alcoholism. The Senate has passed the bill unanimously and a similar one is now being considered by the House of Representatives, (HR18875) introduced by Rep. Staggers (W. Va.)

This was a significant and welcome relief for the police and law enforcement agencies. But because the lack of funds prevented the development of local services to treat alcoholics, there was an enormous increase in state hospital admissions of alcoholics. In the State of Maryland, more than 50% of the admissions to state hospitals are alcoholics. Alcoholism represents the largest single diagnosis and dramatically exceeds admissions for schizophrenia or any other diagnosis.

Our small staff of three professionals in the Division of Alcoholism Control focused on educating the community about alcoholism. This, too, resulted in enormously greater case finding and referral of alcoholics for treatment than had taken place before the law was passed. Unfortunately, adequate alternative facilities were not yet available in the community and admissions to state hospitals swelled. From the inner city, 66% of all admissions to state hospitals are for the diagnosis of alcoholism.

The communities certainly felt the pressure because in the second year the Maryland Legislature did appropriate a small sum for alcoholism control. As a result, services are now proliferating for alcoholics. Outpatient services, for example, quadrupled as of December 1969, compared to what they were in December 1968.

Fifty percent of the general hospitals in Maryland are now admitting alcoholics under that diagnosis, a phenomenon which had not existed before our law was passed.

Perhaps the greatest lesson we have learned in Maryland, from our need to develop services without funds, lay in the innovative staffing pattern we developed perforce and by design.

We are utilizing nonprofessional alcoholism counselors in addition to other, more traditional professional groups such as the clergy, the public health nurses, the general practitioners, the probation officers, and the social workers to staff alcoholism clinics.

In Hagerstown, the alcoholism clinic operates without a single expensive psychiatrist or physician. It is staffed by one public health nurse, one trained alcoholism counselor who is a recovered alcoholic, and a volunteer.

This one small clinic, within a year and a half, has 60 alcoholics on its rolls and I am sure that the results of this treatment are not inferior to that provided by other clinics where more expensive personnel are employed. In fact, my clinical impression is that it is quite effective.

What I think is indispensable is the appointment, in every local health department, of a full-time alcoholism coordinator who will be responsible for exploring and using local facilities that are already available for alcoholics. He will also be responsible for using existing services for the treatment of people who desperately need treatment and who have been neglected for so long.

Let me cite as an example one county in Maryland, St. Mary's, with a population of less than 45,000. Within one year, what resulted from the appointment of an alcoholism coordinator in the county health department is that every general practitioner there now treats alcoholics.

The alcoholism coordinator has made arrangements with these general practitioners not to turn alcoholics away, because the general hospital will now also routinely admit them for treatment in the regular medical services. Moreover, this hospital is staffed by the regular hospital personnel.

In the first three months of 1970, 38 patients were admitted to this hospital and ten were treated in the emergency room from which they were directly discharged.

The alcoholism coordinator visits the hospital daily and gets referrals from the nurses throughout the wards of those patients admitted as alcoholics, so that a case finding is immediately done. The coordinator can then counsel these alcoholics and their families. He has also been able to use members of Alcoholics Anonymous as "hospital sitters" with alcoholics. This lightens the burdens of the scarce nursing personnel, while, at the same time, transmitting some of the AA members' own expertise as alcoholics in handling other alcoholics.

Likewise, in that county, 215 alcoholics who had been discharged to the community from state hospitals were referred to the coordinator. They came from the courts, from the general hospitals, from the Department of Social Services, from public health nurses, from the clergy, and from the schools. In every case, this coordinator counseled not only the alcoholic, but when a family was available, the family as well.

The coordinator reports that more than 3,000 junior and senior high school students were involved in discussions about alcoholism. This was not simply education about the nature and effects of alcohol as part of the regular school curriculum. It went beyond this into discussions of alcoholism per se, and the development of responsible behavior in a drinking society.

In addition, this coordinator has organized single-day training programs for the professionals, and in that small county, more than 100 professionals have attended such day-long training programs. He has also conducted public, town hall forums about alcoholism with more than 250 in attendance. And I am informed that he is sending 16 of his county's residents to our week-long Institute of Alcohol Studies at Hood College in Frederick.

This man, himself, is a recovered alcoholic, and has been doing the kind of job we hope to see duplicated throughout the state in every other county. Already, in the City of Baltimore where the problem is greater, of course, a similar program is being introduced with a much larger staff of personnel.

I would like also to relate the experience of The Johns Hopkins Hospital, which had not acquired fame in the past for the treatment of alcoholics, although there were many alcoholics admitted throughout the hospital under other diagnoses. There was, however, no specialized focus on this illness anywhere in the hospital.

In a similar development at The Johns Hopkins Hospital, alcoholism counselors and an alcoholism nurse-coordinator were appointed to the staff. In the present fiscal year of 1970, 920 alcoholics were specifically referred to these counselors for treatment; 64% of them came from the emergency room, 34% came from the medical service, and 2% came from other services in the hospital.

Two thirds of all of these alcoholics accepted referral for follow-up care, 127 of them were sent to what we call a quarter-way house—really an extended care facility from The Johns Hopkins emergency room. Actually it is a Flynn Christian Fellowship Home, a private, nonprofit group in The Johns Hopkins vicinity which has contracted with the hospital so that 12 beds are set aside for referrals from the hospital. Those patients who are too sick to be sent out in the street, but are not sick enough to occupy a hospital bed, are referred to this home with the result that, to date, 127 of them have been treated.

The Department of Social Services pays $5 a day for the care of such patients in this quarter-way house, a sum which compares with the state hospital rate of $13 a day, and The Johns Hopkins Hospital bed cost of $92 a day.

From July 19, 1969 to December 31, 1969, the hospital estimates that close to $6,000 was saved through this program. There is also an Alcoholics Anonymous group which now meets in The Johns Hopkins Hospital.

A year ago, no such program existed at The Hopkins for the specific care of alcoholics suffering from acute intoxication. We are now duplicating this pioneer program at the University of Maryland Hospital, and in a short time we hope similar quarter-way houses will be set up in other general hospitals, including the Provident and the City Hospitals.

These are some of the lessons we have learned in Maryland which may be helpful in answering the question, "Who is to do the job set out in your program?"

Our experience points out the essential fact that state and local responsibility for the care of alcoholics must be assigned. When you assign such local responsibility, I feel it must be in the mainstream of American medicine and social welfare.

I would like to briefly outline some guidelines that we have been using in the State of Maryland. As law enforcement and correctional agencies are being phased out of the management program of alcoholics, there needs to be authorized personnel to pick up the alcoholics and to direct them into more appropriate channels.

These personnel, as I have said, should be in the mainstream of public health and social welfare agencies. I am only too well aware of the fact that psychiatry has in the past also neglected alcoholism, but at the same time it has been the principal light focusing on the problem as a disease entity. It was the father of American psychiatry, Benjamin Rush, who first called it a "disease" in 1785. It is listed in the *American Psychiatric Association Diagnostic Manual* as "alcoholism addiction". I think psychiatrists must continue to be involved, but we must also galvanize the vast health and social welfare personnel in our country as well.

Since the present generation of health personnel are not prepared to help alcoholics because they are relatively uninformed, even misinformed (I learned very little about alcoholism in the professional schools I attended), priority must be given to education so that these professionals can play their appropriate roles.

At one of the first meetings we held in Maryland, a social worker complained that no funds were available for her activity in the field of alcoholism. One of our local legislators refused to accept this criticism stating that the social worker was already being paid to help sick and troubled people, and that alcoholics came under that category. What was needed was to learn how to help these people as a prelude to accepting them.

It is a necessary priority then, I think, to educate the people who are already involved, and to introduce alcoholism content into the curricula of professional schools.

Since this is a public health problem, it seems to me that local leadership should be vested in the local health departments, and that emphasis should be given to alcoholism in this area of programming.

With the experience of community mental health centers and comprehensive health centers in decentralizing the treatment of illness back into the community, the treatment of alcoholics should likewise be decentralized. I feel that funding should be much more closely determined by the local and regional personnel than by more distant national areas.

The community mental health centers should make a full range of services available to alcoholics, preferably by the addition of alcoholism counselors on their staffs. Because of the valuable experience of AA and Alanon, and the fellowships generally, I think nonprofessional staffs should be added to every health department and agency.

While AA will continue to be the primary resource in this country to help alcoholics, I think that it is important for public health leadership to develop its own expertise to do the things in program development that Alcoholics Anonymous cannot, and perhaps should not, provide. These include: early case-

finding; early diagnosis; management of the drinking alcoholic who perhaps will continue to drink in spite of the proliferation of services; medical care, which Alcoholics Anonymous certainly cannot give; training of professional personnel; and research so that we may learn more about the mysteries of alcohol addiction.

All alcoholics are motivated to seek treatment. In my experience, I have never come across an alcoholic who is not hurting and who does not want help. I think it is time to motivate the professionals to take their rightful place in the treatment of alcoholism.

I think, too, that we professionals who work with alcoholics have an enormous advantage that no other illness I know of can lay claim to, ie, the existence of thousands of volunteers, many of whom are themselves recovered alcoholics or the wives and husbands of alcoholics, who are ready to place their knowledge and their devotion in the service of suffering humanity.

Senator Hughes: Thank you very much, Dr. Weisman. I am rather glad that you did not have a prepared statement. It was an eloquent presentation. I want to extend my congratulations to you for your program in Maryland and the enlightened approach to alcoholism in many of the cities of Maryland.

anxiety: the tyrant

Excessive anxiety can often dominate the patient made vulnerable by illness, surgery, prolonged emotional stress. It can induce or aggravate symptoms, disrupt medical management, divert energy the patient needs for recovery.
The antianxiety action of Librium® (chlordiazepoxide HCl)—used adjunctively or alone—has demonstrated clinical usefulness in virtually every field of medical practice where anxiety complicates the patient's condition.

for the patient ruled by anxiety

Librium® (chlordiazepoxide HCl) 5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.
Contraindications: Patients with known hypersensitivity to the drug.
Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.
Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.
Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

BETHESDA MD 20014

The bluest blue chip of them all.

Danny Sullivan never made the baseball team. But because he's had the right training, you'd be surprised at the number of jobs open to him.

The nicest part, of course, is that another handicapped person is getting the most out of his life.

However, there's something else good, too.

Vocational rehabilitation pays.

Every dollar spent to rehabilitate a person like him—someone with a physical or mental handicap—will increase his lifetime earnings by $35. (Thirty-five taxable dollars that he earns himself.)

Which is why vocational rehabilitation is good for everybody.

We call our program HURRAH. Actually, HURRAH stands for "Help Us Reach & Rehabilitate America's Handicapped."

When you realize there are five million handicapped people who can be helped by vocational rehabilitation, you can see what a big job is ahead.

If you want to know more about the job that vocational rehabilitation is doing, and the rich dividends it pays, write to HURRAH, Box 1200, Washington, D.C. 20013.

Ask for "Rehabilitation—A Blue Chip Investment." It's free.

Then if anyone ever asks you if rehabilitation is worth the cost, you'll know what we at HURRAH have found out:

From every angle, a human being is the bluest blue chip investment there is.

HURRAH. The State-Federal Program of Rehabilitation Services.

Help Us Reach & Rehabilitate America's Handicapped **HURRAH**

LACTINEX®

LACTINEX®

TABLETS & GRANULES

■ to help restore and stabilize the intestinal flora

■ for fever blisters and canker sores of herpetic origin

Introduced to help reestablish the normal physiology of the intestinal tract in gastrointestinal disturbances[1], particularly diarrheas (including those resulting from antibiotic therapy), Lactinex is also useful for reestablishing the flora following bowel surgery, infant colic, mucous colitis, foul-smelling stools, pruritus ani, flatulence and hives.[2,3,4,5,6]

Lactinex contains a viable mixed culture of both *Lactobacillus acidophilus* and *L. bulgaricus* with the naturally occurring metabolic products produced by these organisms.

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

HYNSON, WESTCOTT & DUNNING, INC.

Baltimore, Maryland 21201

A urinary tract infection was eliminated last week

Intestinal monilial overgrowth has appeared this week

For women who are diabetic or debilitated, oral antibiotic therapy often sets the stage for monilial overgrowth in the intestine.

When you anticipate such a problem, take action with DECLOSTATIN 300. It combines the broad-spectrum potency of demethylchlortetracycline with the antifungal effectiveness of nystatin—it helps avoid monilial take-over. Experience has shown DECLOSTATIN to be highly useful for many women patients; individual culture studies will show exactly where this usefulness may best be applied.

It doesn't let monilia begin where bacteria end. Declostatin® 300

Demethylchlortetracycline HCl 300 mg and
Nystatin 500,000 units Capsule-Shaped Tablets Lederle

Effectiveness: Because its antibacterial component is DECLOMYCIN® Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose-related. Transient, reversible, nephrogenic diabetes insipidus with excessive thirst and polyuria (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: One tablet b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

maryland state MEDICAL JOURNAL

VOLUME 19 DECEMBER 1970 NUMBER 12

CONTENTS:

The Need for Continuing Education, Robert J. Thomas, MD 64

"At the Frederick Memorial Hospital, a program recognizing the need for continuing education has been developed. This unique program seeks to afford intellectual stimulation to the medical community of Frederick."

Histoplasmosis, Henry V. Chase, MD 65

"The purpose of this article is to discuss histoplasmosis as it is found in Maryland, Virginia and, more recently, the District of Columbia. Some scientific studies made in these areas will be presented, along with some of the history of the disease. Some comments concerning diagnosis are included, as well as a few general remarks about the treatment of the disease."

Shigella and Salmonella Infections in Frederick County, Charles G. Spicknall, MD, FACP 71

"Salmonella and shigella infections have been the greatest problem in communicable diseases in Frederick County in the past three years. While no deaths have occurred, these diseases have been a major cause of illness."

Q Fever, Russell L. Guest, MD 73

"A review of the cases of rickettsial disease experienced at the Frederick Memorial Hospital during the period 1959 to 1969 was performed recently. The case records indicated that Rocky Mountain spotted fever was diagnosed in 13 cases and recovery was achieved in 12 of them. One patient died."

The Lymphocyte, Robert J. Furie, MD 75

"The biology of the lymphocyte has become one of the most exciting stories in contemporary medicine. For most of us, having been out of medical school for some years, the small lymphocyte is a cell in the 'white cell' series, about which we were taught little."

Postoperative Wound Infections, Robert J. Thomas, MD 77

"In the history of surgery, a major period of significant advance took place when an understanding of the role of bacteria in wound infections led to remedial practices. This period of success was achieved by the employment of strict practices aimed at reducing the opportunity for infection, from within or from without."

Exploratory Laparotomy in Fever of Unknown Origin, Rex Martin, MD 79

"It has been established that about 40% of patients with fever of unknown origin will eventually develop features which will permit a diagnosis to be made. About half of these problem cases will recover without having had a diagnosis established. Ten percent of this group will continue to be febrile, without a diagnosis being reached."

COMMISSION RULES AND REGULATIONS

The rules and regulations of the Commission on Medical Discipline are being republished. Inquiries regarding these matters should be addressed to the Commission or the Board at the above address.

CONFUSION IN MEDICAL DISCIPLINE

Some confusion exists concerning the responsibilities of the Commission on Medical Discipline.

In medical discipline cases, the local society or the Faculty must conduct the investigation. The members of the Commission then act as judges and consider and act on recommendations made to it by either the local medical society or the Faculty.

PROFESSIONAL CORPORATIONS

There is also some confusion about names applied to Professional Corporations as formed under Maryland statutes concerning such corporations.

The name of one or more of the individual incorporators must appear in the corporate name, followed by the initials "PA", or the words "Professional Corporation".

EXCERPT FROM REPORT

The state's Comprehensive Health Planning Agency, in a report dealing with Certification of Need for Health Services and Licensure, has stated:

"...the Health Services and Facilities Committee recommends that ways be studied to include the private solo practitioner in comprehensive health planning and future legislation."

THINGS TO PLAN FOR

Scheduled programs for coming months include:

January 2, 1971 - Woman's Auxiliary Tour of Hospital Ship HOPE and Reception

January 7, 1971 - 2:30 PM in the Belvedere Hotel. A Medicolegal Symposium will be held in conjunction with the mid-winter Maryland State Bar Associati Meeting. This will be in the form o a mock-trial, involving a back injur and should be of interest to all physicians.

January 14, 1971 - All day seminar dealing with the Whys, Hows and Wherefores of the Drug Abuse Syndrome. (If interested, call Faculty office as reservations are required).

March 31, 1971 - Meeting on Medical Emergency Services

VISITS TO COMPONENTS

The Executive Director has begun making annual visit to Component Medical Societies. Those Societies already visited for the 1970-71 year include Dorchest County, Anne Arundel County and the Maryland ENT Society.

COMPUTER BILLING

1971 dues bills will be in the mail early in December 1970. This year, they will be printed by a computer- if you find a mistake, please let us know so the appr priate corrections can be made.

John L. Sargeant
Executive Director

MAY 12, 13, 14, 1971

173rd Annual Meeting of the Medical and Chirurgical Faculty

at the

BALTIMORE CIVIC CENTER

The scientific sessions will include:

MEDICAL PEDIATRIC GRAND ROUNDS, conducted by **Marvin Cornblath, MD,** Professor and Head, Department of Pediatrics, University of Maryland School of Medicine

SURGICAL PEDIATRIC GRAND ROUNDS, conducted by **J. Alex Haller, Jr., MD,** Robert Garrett Professor of Pediatric Surgery, The Johns Hopkins University School of Medicine

PANEL-SYMPOSIUM on Treatment of the Alcoholic and the Family: Practical Aspects, conducted by **Martin L. Singewald, MD,** Chairman of the Committee on Medicine and Religion of the Medical and Chirurgical Faculty

PAPERS presented by the following nationally eminent speakers:

Alan F. Guttmacher, MD
President, Planned Parenthood
World Population

G. Rainey Williams, MD
Professor of Surgery and Chairman,
Department of Surgery, University
of Oklahoma Medical Center

George E. Schreiner, MD
Director, Nephrology Division,
Department of Medicine, Georgetown
University School of Medicine

Saul Krugman, MD
Professor and Chairman,
Department of Pediatrics
New York University

Lawrence K. Pickett, MD
Professor of Pediatric Surgery
and Pediatrics, Yale University
School of Medicine

Nicholas J. Pisacano, MD
Secretary, American Board of
Family Practice, Inc., University
of Kentucky Medical Center

Edward C. Rosenow, Jr., MD
Executive Director
American College of Physicians

Neil L. Chayet
Counsellor at Law
Boston, Massachusetts

SCIENTIFIC* AND TECHNICAL EXHIBITS will be on display at the Civic Center. Every physician should avail himself of the opportunity to see much of what is new in medicine.

OTHER ACTIVITIES scheduled for the Annual Meeting are:

ROUND TABLE LUNCHEON, Baltimore Civic Center

HOSPITALITY NIGHT, Baltimore Hilton Hotel

PRESIDENTIAL RECEPTION AND BANQUET, Blue Crest North
A dinner-dance with Rivers Chambers Orchestra

ART AND HOBBY EXHIBIT,* Baltimore Civic Center

HEALTH EVALUATION TESTS, Baltimore Civic Center

*Applications for **Scientific Exhibits** and the **Art and Hobby Exhibit** appear elsewhere in this Journal.

Committee on Program and Arrangements

PUBLISHED TO REPLACE A PREVIOUS ADVERTISEMENT WHICH THE FOOD AND DRUG ADMINISTRATION CONSIDERED MISLEADING

The Food and Drug Administration has requested that we bring to your attention a recent promotional campaign for Garamycin Injectable (gentamicin sulfate) which featured a nationwide *in-vitro* hospital survey involving a comparison of sensitivity patterns of Garamycin Injectable and seven other antibiotics.

The FDA considers the advertising misleading in several respects such as:

The *in-vitro* chart contained in the ads, which compared Garamycin Injectable with seven other antibiotics, implied that Garamycin Injectable is clinically more effective than the seven other compared antibiotics. THE FACTS ARE (1) THAT DIRECT EXTRAPOLATION OF NONCLINICAL FINDINGS TO CLINICAL EFFECTIVENESS IS UNWARRANTED, AND (2) THAT THE ADVERTISED *IN-VITRO* COMPARISONS DO NOT CONSTITUTE A VALID BASIS FOR SUGGESTING THAT GARAMYCIN INJECTABLE HAS GREATER CLINICAL EFFECTIVENESS THAN THE COMPARED ANTIBIOTICS.

The *in-vitro* chart and information contained under the ad heading, "Indications" presented *in-vitro* data results in such a way as to imply that the drug is indicated for Gram-positive bacteria, such as *Staphylococcus aureus.* GARAMYCIN INJECTABLE IS NOT APPROVED FOR INFECTIONS DUE TO ANY GRAM-POSITIVE ORGANISMS.

We emphasize that Garamycin Injectable is approved for use only in infections due to susceptible strains of gram-negative bacteria, including Pseudomonas aeruginosa, and species of indole-positive and indole-negative Proteus, Escherichia coli, and Klebsiella-Aerobacter.

Injectable Garamycin®

brand of gentamicin sulfate injection

Schering

Each cc. contains gentamicin sulfate equivalent to 40 mg. gentamicin

BRIEF SUMMARY

INDICATIONS GARAMYCIN Injectable is clinically effective in infections due to susceptible strains of gram-negative bacteria, including Pseudomonas aeruginosa, and species of indole-positive and indole-negative Proteus, Escherichia coli, and Klebsiella-Aerobacter. Bacteriologic studies should be conducted to identify the causative organism and to determine its sensitivity to gentamicin sulfate. Sensitivity discs of the drug are available for this purpose. If the susceptibility tests indicate that the causative organism is resistant to gentamicin sulfate, other appropriate antibiotic therapy should be instituted.

This drug should be limited to the treatment of serious infections caused by gram-negative bacteria, particularly Pseudomonas aeruginosa, Proteus and other susceptible organisms, with due regard for relative antibiotic toxicity. Therefore, the drug should be considered for use against gram-negative: 1. Bacteremia; 2. Infected surgical wounds; 3. Severe soft tissue infections, including burns complicated by sepsis; 4. Respiratory tract infections; and 5. Selected cases of urinary tract infection.

CONTRAINDICATIONS GARAMYCIN Injectable is contraindicated in individuals with a history of hypersensitivity or toxic reactions to gentamicin.

WARNINGS Patients receiving treatment with GARAMYCIN should be under close clinical observation because of the toxicity associated with the use of this drug. Ototoxicity, vestibular and auditory, can occur in patients, primarily those with pre-existing renal damage, treated with GARAMYCIN Injectable, usually for longer periods or with higher doses than recommended.

GARAMYCIN Injectable is potentially nephrotoxic, and this should be kept in mind when it is used in patients with pre-existing renal impairment. Kidney function diminished by infection of the upper urinary tract may, however, improve during effective treatment with GARAMYCIN Injectable.

Concurrent administration of potentially ototoxic drugs such as streptomycin and kanamycin or of potentially nephrotoxic drugs such as polymyxin, colistin, and kanamycin with gentamicin sulfate has not been shown to afford any clinical advantages and, moreover may result in additive toxicity. Monitoring of vestibular, cochlear, and renal function will provide guidance for therapy in such cases.

PRECAUTIONS In patients with impaired renal function in whom serious infection develops, serum concentrations of the drug may rise, with consequently increased risk of ototoxicity. In these patients or in those in whom recommended dosage or duration of therapy must be exceeded as a life-saving measure, routine studies of kidney function should be performed when possible. These may be supplemented by evaluation of the vestibular and auditory function and measurement of serum concentration of the drug when feasible. Serum concentration of gentamicin should be maintained below the range of 10-12 mcg./ml. to reduce risk of ototoxicity.

Ordinarily, treatment should not be given for more than 7 to 10 days or be repeated unless required for serious infection not responsive to other agents.

As with other antibiotics, treatment with GARAMYCIN Injectable may occasionally result in overgrowth of nonsensitive organisms. If superinfection occurs, appropriate therapy is indicated.

Safety for use in pregnancy or the potential for fetal ototoxicity or nephrotoxicity have not been established. Studies in pregnant animals have not revealed teratogenic or ototoxic effects in the fetus. GARAMYCIN Injectable should not be used in pregnant patients or in women of childbearing age unless its use is deemed advisable by the physician.

ADVERSE REACTIONS The overall incidence of ototoxicity considered related to treatment with GARAMYCIN Injectable was 2.8 per cent (16 of 565 patients). Contributory factors (two or more factors were relevant to most patients) were as follows: 10 had azotemia, 10 received a total of 1 gram or more of the drug, 7 had recently received other potentially ototoxic antibiotics (streptomycin or kanamycin), and 5 were over 60 years of age. Six also had decreased high-tone hearing acuity, which returned to or toward normal in the 4 patients retested.

Analysis of BUN data indicated that 4 (2%) of 172 patients showed increases in BUN that were probably related to treatment with GARAMYCIN Injectable. Of 20 increases probably or possibly related to treatment, 7 were reversible, 9 occurred in terminal patients, and 4 had no follow-up.

Other adverse reactions associated with treatment were one instance each of urticaria, decreased hematocrit, and reversible depression of granulocytes with normal bone marrow. Other rarely reported and possibly treatment-related adverse reactions were anemia, increased reticulocyte count, rash, purpura, drug fever, hypotension, convulsions, twitching, salivation, nausea, vomiting, increased transaminase activity (SGOT or SGPT), increased serum bilirubin, decreased serum calcium, and joint pain.

PACKAGING GARAMYCIN Injectable, 40 mg./cc., 2-cc. multiple-dose vials, for intramuscular administration.

count the many reasons WHY

the Credit Bureau is your best bet on collection problems

- Our collection department, using data processing, has the personnel and know-how to collect your past-due accounts in an ethical, efficient and effective manner.
- Over 2,000,000 reports in our files are of valuable assistance in effecting collection. Only the Credit Bureau has this advantage.
- Collections never die in the files of the Credit Bureau. Every account becomes part of a credit record for reporting to other businesses—a powerful incentive to prompt payment.
- Affiliation with 3500 other credit bureaus and collection agencies makes collections in all parts of the country fast and efficient.
- Our service costs you not one penny if no money is collected from your patient. Checks, minus commissions, are mailed to you monthly.

Did You Know?

- Workers who smoke as much as a pack of cigarettes a day spend a third more time away from their jobs because of illness than do people who have never smoked, government studies show.

- When you inhale a cigarette your blood pressure goes up. Your heart beats 15 to 25 times extra per minute.

- By switching from cigarettes to a pipe you can cut your risk of a heart attack to that of a non-smoker. But you increase the risk of cancer of your lips and tongue, but not your lungs.

- Smokers average 15% more days of illness in bed than those who have never smoked. For heavy smokers (more than two packs a day) the rate is 1½ times higher among males, and 2½ times higher for females.

- In 1900, per capita consumption of cigarettes was 54 annually. By 1968 it was 4,195.

- A greater risk of unsuccessful pregnancy is experienced by women who smoke.

- Life expectancy among young men is reduced by an average of eight years among heavy (over two packs a day) cigarette smokers and an average of four years among light (less than half a pack a day) smokers.

- Cigarette smoking is the most important cause of chronic bronchitis in the U.S.

- Your risk of a heart attack, even sudden death, are three times as great if you smoke 20 cigarettes a day as they are if you do not smoke—or smoke a pipe or cigar.

"Drug research gives me the tools that save lives."

A family doctor looks at new developments in the pharmaceutical industry. And he speculates on the future.

When I look back at some of my old records, I'm constantly reminded of the changes that have come about in medicine just during the past twenty-five years. Some of the diseases I treated and prayed over in the '40's are found mostly in medical history books now.

Thanks to drug research and development, we've made substantial gains in the control of cardiovascular disease, diabetes, malaria, mental illness, strep and staph infections, meningitis and a long list of ailments. It seems like only yesterday when a diagnosis of pneumonia was almost the kiss of death. Now, with modern medical techniques and drug therapy, we can offer some real help.

My records on polio, influenza and measles show an unbelievable trend for the better. New vaccines have reduced the toll of these age-old threats dramatically. And I see patients in pain from crippling arthritis helped with new medicinals unknown just a few years ago.

I hear questions about the three billion or so dollars spent by the drug industry in research during the past ten years . . . working on new and better drug products. It does seem like quite a bit of money to spend, and I realize some of it goes into dead ends. That's the problem with research, any research . . . you often don't know where you're going until you get there. I want all the tools I can get to help my patients. I want more drugs and more effective drugs. If they mean less pain, longer lives and more productive careers for those I treat . . . well, that's what really counts.

Another point of view . . .
Pharmaceutical Manufacturers Association, 1155 Fifteenth Street, N.W., Washington, D.C. 20005.

Roche announces

Efudex®

(fluorouracil) cream/solution

for the treatment of solar/actinic keratoses... a topical alternative to conventional therapy

Fluorouracil—the Roche contribution

In 1962, Roche Laboratories introduced Fluorouracil Roche® (5-fluorouracil). Early clinical work with this drug suggested that it possessed a selective cytotoxic activity when applied topically to certain kinds of lesions. Based on this work and years of clinical trials, a standardized form of topical fluorouracil can now be recommended for treatment of multiple solar or actinic keratoses.

Efudex®(fluorouracil)—a new alternative to conventional therapy

Efudex presents the physician with a topical alternative to surgery in the treatment of solar or actinic keratoses. It is effective, comparatively inexpensive and especially well-suited for treatment of multiple lesions. Important, too, is the highly desirable cosmetic result. Clinical experience demonstrates that treatment with Efudex results in an extremely low incidence of scarring.*

Highly effective on first and later applications

In clinical trials, depending on the dosage form and strength used, complete involution occurred in 77 to 88 per cent of lesions following treatment. The rate of recurrence was low, ranging from 1.7 to 5.6 per cent up to a year after completion of therapy. When lesions did recur or new ones appeared, repeated courses of Efudex therapy proved effective.*

1/22/68—Treatment with 5% 5-FU cream commences. Patient K.L. showing widespread but mild solar keratoses (also known as actinic keratoses).

/2/68—After 11 days of treatment. rythema is seen at site of keratoses. In ddition, numerous lesions not apparent rior to therapy have become manifest y sharply defined reactions. Intervening kin, also treated, shows no response to ierapy.

/19/69—One year after cessation of ierapy. Skin appears clear with no evi- ence of scarring. Examination reveals ck of recurrence or the formation of ew lesions.

Predictable sequence of therapeutic response

Two to four weeks constitutes a typical course of Efudex therapy. The response is usually characteristic and predictable. After three or four days of treatment, erythema begins to appear in the area of the keratoses. This is followed by an intense inflammatory response, scaling and occasionally moderate tenderness or pain. The height of the inflammatory reaction generally occurs two weeks after the start of therapy, and then begins to subside as treatment is stopped. Within two weeks of discontinuing medication, the inflammation is usually gone. A mild erythema may remain for two to three months before gradually receding.

Selective—with a high degree of safety

Despite the temporary unsightliness and discomfort of the inflammatory episode, Efudex is, in general, more readily tolerated than surgery. Clinical work shows the intense inflammatory response to be limited to the area of the lesion. Normal skin is not similarly affected. Another measure of Efudex safety: systemic absorption of topical fluorouracil was insignificant, indicating a low risk of systemic toxicity.*

Two strengths—two convenient dosage forms

Efudex is available as a 2% or 5% solution or as a 5% cream. It is applied twice daily by the patient with a nonmetal applicator or suitable glove.

Before prescribing Efudex, however, there are two important considerations. First, please consult the complete prescribing information for precautions, warnings and adverse reactions. Second, advise the patient that treated lesions should respond with the characteristic but transient inflammation. A positive sign that Efudex is working for them.

*Data on file, Hoffmann-La Roche Inc., Nutley, New Jersey.

2% and 5% Solutions; 5% Cream Applied twice daily—resolves solar or actinic keratoses.

new Efudex® (fluorouracil) cream/solution

For full prescribing information, please see the following page.

Roche introduces

Efudex®

(fluorouracil) cream/solution the new standardized topical for solar/actinic keratoses

Description: Efudex solutions and cream are topical preparations containing the fluorinated pyrimidine 5-fluorouracil, an antineoplastic antimetabolite.

Efudex Solution consists of 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris-(hydroxymethyl) aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.

Efudex Cream contains 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

Actions: There is evidence that the metabolism of fluorouracil in the anabolic pathway blocks the methylation reaction of deoxyuridylic acid to thymidylic acid. In this fashion fluorouracil interferes with the synthesis of deoxyribonucleic acid (DNA) and to a lesser extent inhibits the formation of ribonucleic acid (RNA). Since DNA and RNA are essential for cell division and growth, the effect of fluorouracil may be to create a thymine deficiency which provokes unbalanced growth and death of the cell. The effects of DNA and RNA deprivation are most marked on those cells which grow more rapidly and which take up fluorouracil at a more rapid pace. The catabolic metabolism of fluorouracil results in degradative products (*e.g.*, CO_2, urea, α-fluoro-β-alanine) which are inactive.

Studies in man with topical application of ^{14}C-labeled Efudex demonstrated insignificant absorption as measured by ^{14}C content of plasma, urine and respiratory CO_2.

Indications: Efudex is recommended for the topical treatment of multiple actinic or solar keratoses.

Contraindications: Efudex is contraindicated in patients with known hypersensitivity to any of its components.

Warnings: If an occlusive dressing is used, there may be an increase in the incidence of inflammatory reactions in the adjacent normal skin.

Prolonged exposure to ultraviolet rays should be avoided while under treatment with Efudex because the intensity of the reaction may be increased.

Usage in Pregnancy: Safety for use in pregnancy has not been established.

Precautions: If Efudex is applied with the fingers, the hands should be washed immediately afterward. Efudex should be applied with care near the eyes, nose and mouth. To rule out the presence of a frank neoplasm, a biopsy should be made of those areas failing to respond to treatment or recurring after treatment.

Adverse Reactions: The most frequently encountered local reactions were pain, pruritus, hyperpigmentation and burning at the site of application. Other local reactions included dermatitis, scarring, soreness and tenderness.

Also reported were insomnia, stomatitis, suppuration, scaling, swelling, irritability, medicinal taste, photosensitivity and lacrimation.

Laboratory abnormalities reported were leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.

Dosage and Administration: Efudex should be applied twice daily with a nonmetal applicator or suitable glove in an amount of the solution or cream sufficient to cover the lesion. When Efudex is applied to a lesion, a response occurs with the following sequence: erythema, usually followed by vesiculation, erosion, ulceration, necrosis and epithelization. The lower frequency and intensity of activity in adjacent normal skin indicate a selective cytotoxic property. Medication should be continued until the inflammatory reaction reaches the erosion, necrosis and ulceration stage, at which time use of the drug should be terminated. The usual duration of therapy is from 2 to 4 weeks. Complete healing of the lesion may not be evident for 1 to 2 months following cessation of Efudex therapy.

How Supplied: Efudex Solution, 10-ml drop dispensers—containing 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris(hydroxymethyl)aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.

Efudex Cream, 25-Gm tubes—containing 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

Clinical Studies: The effectiveness of the three preparations as determined by complete involution of solar keratoses was: 2% Solution, 77% of 282 lesions; 5% Solution, 88% of 202 lesions; and 5% Cream, 85% of 189 lesions. In those lesions with complete involution followed treatment, the rate of possible recurrences observed clinically at periods up to 12 months or more was: 2% Solution, 4.6% of 218 lesions; 5% Solution, 1.7% of 7[illegible] lesions; and 5% Cream, 5.6% of 160 lesions. Because of the toxic potential of fluorouracil, some physicians preferred to use the 2% solution when large areas were to be treated. Approximately 3[illegible] of the lesions required treatment for two weeks or less; approximately 78% required four weeks or less for adequate treatment.

Book Reviews

ESSENTIALS OF CLINICAL ENDOCRINOLOGY, Norman G. Schneeberg, MD; The C. V. Mosby Company, St. Louis, Missouri, 1970.

This book is designed for the individual who is untutored in endocrine matters and who seeks a didactic introduction or brief review of this subject. Clinical features are stressed, with particular emphasis on the practical aspects of therapy.

It is not planned as a reference manual or as a bibliographic repository. Dr. Schneeberg has called on many outstanding contributors in this work, which is well worth having in your library.

ATLAS OF NUCLEAR MEDICINE, Lung and Heart, Volume 2, Frank H. DeLand, MD; and Henry N. Wagner, Jr., MD; The W. B. Saunders Company, Philadelphia, Pennsylvania, 1970.

This volume contains discussions of cardiac as well as pulmonary diseases as studied with static images. Included also are images from the new procedure of nuclear angiography, which is proving increasingly useful for evaluating heart, lung, and vessel circulation.

This book should be of great interest to internists, and to those who are actively specializing in this area of radiology.

SYNOPSIS OF ANATOMY, Liberato J. A. DiDio, MD, PhD; The C. V. Mosby Company, St. Louis, Missouri, 1970.

The editor, along with the nine contributors to this publication, offer a more than adequate case presentation for synthesizing the important aspects of anatomy and streamlining these aspects into a fairly compact volume.

By so doing, they have conceived an informative, concise, and integrated text.

Put Your Trust In Skilled Hands.

These Are The Hands Of A Professional Occupational Therapist.

Around the clock care is given by our experienced team of registered nurses . . . physical and occupational therapists, licensed dieticians and administrators . . . At House In The Pines we provide Complete Care Programs and facilities for the aged, convalescent and the chronically ill. Physician's orders followed Implicitly.

COMPLETE CARE PROGRAM

- Around the clock professional nursing care.
- Physical and occupational therapy.
- Recreational facilities and programs.
- Well balanced, tasty meals . . . and special diets.
- Safe, fire-proof construction.
- Cheerful, home-like surroundings.

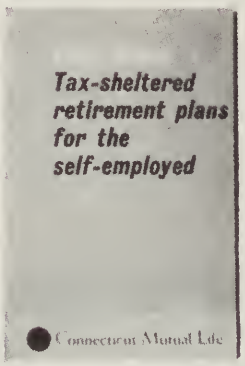
Participating fully in Medicare

Operated by— Medical Services Corporation

Should You Incorporate?

Maybe Yes. Maybe No.



The present I.R.S. position boils down to this: When you become an employee of your own professional corporation or association, a lot of good things can happen. For one thing, you may cut your income tax. For another, you can beef up your retirement investments with more tax-sheltered dollars.

After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the matter further with your attorney or tax accountant.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions. And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet, "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

M*I*S*H*M*A*S*H

1970 semiannual meeting fun night

Physicians of all specialties participated in some good-natured lampooning when the Woman's Auxiliary staged its annual entertainment during the Semiannual Meeting at Hotel Hershey this past September.

One of the highlights of the program, arranged by Vandy Bauer, was a skit entitled M*I*S*H-M*A*S*H, during which the physicians themselves, portraying their peers, literally brought down the house.

Another show-stopper was Dick Bauer in a Shelly Berman-type telephone conversation. Dick was monologuing Executive Director, Jack Sargeant, in hypothetical yet true-to-life conversations with the governor, committee chairmen, and the complaining public.

Other scene stealers were: Angela Linhardt at the piano; Vandy Bauer as a slightly addled woman's club program chairman; and Mrs. George S. Banning and Mrs. John O. Sharrett depicting the ambiguity of PTA messages sent home.

Basic to the performance of M*I*S*H*M*A*S*H, an original script written by Jeanne Sargeant, was a parade of specialists, acting and re-acting to ambivalent lyrics re-written to familiar music by Hilary Sargeant, Angela Linhardt, and John Graham. These songs, with their original words, were sung by a chorus of seven: Mrs. Connie Galton, Mrs. Harold Biehl, Mrs. Charles Bagley, Mrs. Martin Strobel, Mrs. Joanne Ptak, Miss Terry Bromwell, and Miss Hilary Sargeant.

The show got off to a rollicking start with a rendition of "Hey, Big Spender". This was dedicated to all physicians, since they are so regarded by the public. "So let me get right to the point, I don't pop my cork for any old MD. Hey, big spender, spend a little time with me."

Then Pete Peterson, as a radiologist, paraded to "I'll be seeing you in all the old familiar places that this negative encases . . ."

John De Hoff, as that friendly delivery boy, the obstetrician, was musically hailed with "By the time I get to Hopkins, she'll be ready. She'll find the note I left hanging on my door. She'll laugh when she reads the part that says I'm leaving, cause I've missed that girl so many times before. . ."

He was followed by Aaron Sollud as the gynecologist, to the musical accompaniment of "Believe me if all those endearing young charms. . ."

Talmadge Reeves was a smash as the pediatrician. He wore little boy shorts and was consoled by both a huge lollipop and a pacifier as the chorus sang, "On the Good Ship Lollipop."

At this point, the ubiquitous general practitioner broke up the audience in the first of three running appearances as he dashed through with his medical bag to the plaint of his patients: "If it takes forever, we will wait for you." Emanuel Schimunek was the only medico cast in his own specialty.

Next appearing as the glamor boy of medicine, the cardiologist, Elmer Linhardt embraced a huge cardboard heart as the chorus intoned: "I left my heart in Houston, Texas; from Baylor U. it calls to me to be where red and white corpuscles go flowing through my muscles. My morning booze will chase the blues so I don't care. . ."

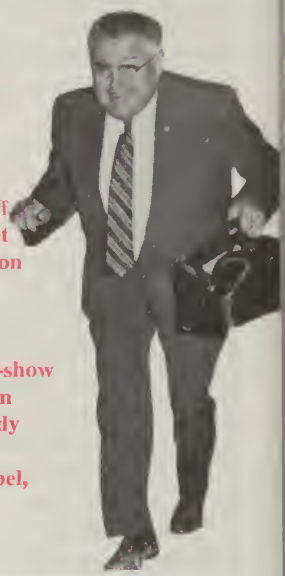
Ray Yow, with a mallet and a bottle of spirits, embodied the anesthesiologist to the tune of "Mr. Sandman," including the plaint, ". . . Mr. Sandman send me a dream, sodium pentathol to ease the pain."

After this, Joe Harrison, with ape mask and mirror, cavorted on stage to depict the plastic surgeon to the tune of "Baby Face".

"Dry Bones" brought the orthopod on stage in the person of Phil Briscoe, complete with skeleton. Then Charlie O'Donnell appeared with plunger, cable, and umbrella to depict the urologist as the chorus offered "Raindrops Keep Falling on my Head."

Andy Mitchell with catsup-stained T-shirt, cleaver, and knife was acclaimed as the surgeon with "Bloody Jerry is the man I love, Bloody Jerry is my surgeon, too, now ain't that too damn bad. . ."

The show came to a wild conclusion when John De Hoff, as the psychiatrist (What Kind of Nut Am I?), quivered on stage with all his hang-ups embodied in a security blanket to which Talmadge Reeves as the pediatrician lay loud vocal and physical claim.



Post show music was presented by Ferdinand Kaden in a free-wheeling-play-it-by-ear concert.

(Continued on next page)

Fun seemed to be the theme of this year's Semiannual Meeting Entertainment Night staged by the Woman's Auxiliary at Hotel Hershey. This page (top to bottom, left to right): Dick Bauer monologuing Jack Sargeant; lollipopped pediatrician Talmadge Reeves; pianist Angela Lindhardt; GP Emanuel Schimunek dashing across the stage; psychiatrist John De Hoff complete with security blanket; and (from left): anesthesiologist Ray Yow, Emanuel Schimunek, Elmer Lindhardt, plastic surgeon Joe Harrison, skit narrator John Graham, and gynecologist Aaron Sollud. Opposite page (top to bottom, left to right): urologist Charles O'Donnell; cardiologist Elmer Lindhardt, with cardboard heart; Ferdinand Kaden, who supplied the post-show music; Mrs. George Banning, Mrs. Vandy Bauer, and Mrs. John Sharrett; and chorus members (next to bespattered surgeon Andy Mitchell): Mrs. Connie Galton, Mrs. Harold Biehl, Mrs. Charles Bagley, Miss Hilary Sargeant, Mrs. Martin Strobel, Mrs. Jo Ann Ptak, and Miss Terry Bromwell

When it comes to medical offices, variety is the name of the game with us. However, it is a special variety which is highly selective of design and most importantly, insists on adequate proportions, comfort and durability. Visit our showrooms or call one of our decorators and put our variety and experience to work for you.

32 WEST ROAD TOWSON, MARYLAND 21204

The concert was just underway,
When to the conductor's dismay
Cramps and diarrhea,
Did so quickly appear,
The maestro no longer could stay.

Because diarrhea with cramping, nausea, and painful straining can strike at the most inopportune time, it takes a comprehensive agent to treat the total diarrheal syndrome and help get the patient back on the job. That's why so many physicians rely on Donnagel, especially during the fall and winter months when "flu" and viral gastroenteritis usually hit their peak.

Donnagel is much more than just a simple kaolin-pectin combination. It also contains the belladonna alkaloids to calm GI hypermotility and help relieve the distressing discomforts which so often accompany diarrhea. Certainly it's less expensive and more convenient than taking two medications. And the dosage is lower too. Available in the handy 4-oz. plastic bottle at pharmacies everywhere on your prescription or recommendation.

When diarrhea and its discomforts separate a man from his job . . .

Donnagel®

Each fluid ounce contains: Kaolin, 6 g.; Pectin, 142.8 mg.; Hyoscyamine sulfate, 0.1037 mg.; Atropine sulfate, 0.0194 mg.; Hyoscine hydrobromide, 0.0065 mg.; Sodium benzoate (preservative), 60 mg.; Alcohol, 3.8%.

Richmond, Va. 23220

Coughs are back.

clear the tract with the

Robitussin® Line

The coughing season is here again. Time to rely on the four Robitussins and Cough Calmers to help clear the lower respiratory tract. All contain glyceryl guaiacolate, the efficient expectorant that works systemically to help increase the output of lower respiratory tract fluid. The enhanced flow of less viscid secretions soothes the tracheobronchial mucosa, promotes ciliary action, and makes thick, inspissated mucus less viscid and easier to raise. Available on your prescription or recommendation.

For coughs of colds and "flu"

Robitussin®

Each 5 cc. contains:

Glyceryl guaiacolate	100.0 mg.
Alcohol, 3.5%	

For unproductive allergic coughs

Robitussin A-C®

Each 5 cc. contains:

Glyceryl guaiacolate	100.0 mg.
Pheniramine maleate	7.5 mg.
Codeine phosphate	10.0 mg.
(warning: may be habit forming)	
Alcohol, 3.5%	

Non-narcotic for 6-8 hr. cough control

Robitussin-DM®

Each 5 cc. contains:

Glyceryl guaiacolate	100.0 mg.
Dextromethorphan hydrobromide	15.0 mg.
Alcohol, 1.4%	

Clears sinuses and nasal stuffiness as it relieves cough

Robitussin-PE®

Each 5 cc. contains:

Glyceryl guaiacolate	100.0 mg.
Phenylephrine hydrochloride	10.0 mg.
Alcohol, 1.4%	

Robitussin-DM in solid form for "coughs on the go"

Cough Calmers™

Each Cough Calmer contains:

Glyceryl guaiacolate	50.0 mg.
Dextromethorphan hydrobromide	7.5 mg.

ARTHUR E. COCCO, MD
Journal Representative

Baltimore City Medical Society

Board of Directors Meets

The October 13, 1970 meeting of the Board of Directors was called to order by the acting chairman, Philip F. Wagley, MD, at 4:30 PM.

The minutes of the September 8 meeting were approved as distributed.

Mr. Ronald Elwell, Specialist, Family Life Education, Baltimore City Public Schools, discussed the present sex education program in the city schools. The Board, after lengthy discussion with Mr. Elwell, felt that the general membership of the Society should be informed of the activities taking place in the schools in this area. Mr. Elwell was invited to speak to the Society at the December 3 meeting and give an outline of the program.

The suggestion was also made that a committee be set up by the Society to investigate this program in greater detail and make recommendations concerning its content to the public school administration.

Richard L. London, MD, treasurer, presented the following report of the Finance Committee which was approved by the Board.

The Finance Committee recommends that:

(a) An audit of the amount paid to the Medical and Chirurgical Faculty for rent and services be requested from the Faculty's comptroller.

(b) $15,000 presently in a 4¾% interest account at the Savings Bank of Baltimore should be withdrawn and placed in a high-yield account.

(c) $10,000 presently in a 5% certificate account at First National Bank should be withdrawn at maturity and invested in Treasury bills.

(d) All interest should be placed in a savings account and, when an appropriate amount is accumulated, it should be invested in stock funds.

Copies of the Policy and Planning Committee Annual Report were distributed for the information of the Board and will be available to the membership at the December meeting of the Society.

The contract with Mr. William Evans to act as parliamentarian for the Society for the coming year was approved. It was mentioned that Mr. Evans performed in an outstanding manner in the past and the Society should extend its appreciation to him.

The Board discussed the merit of sending a representative to the luncheons of the Chamber of Commerce and agreed that unless the topic were of interest to the medical profession, no representative would be sent.

The Board declined to endorse the Loan Question appearing on the November 3 general election ballot which would support a Harbor Campus for the Community College of Baltimore.

No nomination for the Organization Achievement Award given yearly by the Health and Welfare Council was proposed.

Correspondence from Oakley H. Saunders, MD, informed the Board of problems he had encountered in establishing a Well-Baby Clinic for the Baltimore City Health Department in his office. Dr. Farber commented that these problems were being discussed with Dr. Saunders and it was expected that the major points of disagreement had been settled. However, Dr. Saunders also indicated that he would like to have the agreement publicized and the Board suggested that Dr. Saunders be invited to the next meeting to present his views.

Dates for the 1971 general meetings and Board of Directors meetings were approved. The dates are as follows:

Baltimore City Medical Society General Meetings

Thursday, January 7, 1971, 8:30 PM
Thursday, February 4, 1971, 8:30 PM
Thursday, March 4, 1971, 8:30 PM
Thursday, April 1, 1971, 8:30 PM
Thursday, October 7, 1971, 8:30 PM

Thursday, November 4, 1971, 8:30 PM
Thursday, December 2, 1971, 8:30 PM

Board of Directors Meetings

Tuesday, January 12, 1971, 4:30 PM
Tuesday, February 9, 1971, 4:30 PM
Tuesday, March 9, 1971, 4:30 PM
Tuesday, April 13, 1971, 4:30 PM
Tuesday, May 11, 1971, 4:30 PM
Tuesday, June 1, 1971, 4:30 PM
Tuesday, July 13, 1971, 4:30 PM
Tuesday, August 10, 1971, 4:30 PM
Tuesday, September 14, 1971, 4:30 PM
Tuesday, November 9, 1971, 4:30 PM
Tuesday, December 14, 1971, 4:30 PM

Dr. Wagley informed the Board that Dr. Classen was presently in the process of forming a Peer Review Committee and would have further information at the next meeting.

Due to insufficient information, the Board was unable to discuss the problem of physicians referring patients to emergency rooms for treatment in their absence. Further information will be available for the next Board meeting.

A letter of appreciation was noted from Mrs. Alexander Cochran, recipient of the Community Service Award.

There being no further business, the meeting was adjourned at 6:30 PM.

ART AND HOBBY EXHIBIT

Annual Meeting of the Medical and Chirurgical Faculty

MAY 12, 13, 14, 1971 Baltimore Civic Center

APPLICATION FOR ART AND HOBBY EXHIBIT

Fill in and mail to: Chairman, Art and Hobby Exhibit
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore 21201

1. Title of exhibit: .....
.....
2. Amount of space required—depth, width, and height: .....
3. Electrical or other requirements: .....
4. Name of exhibitor: .....
Please print
5. Address of exhibitor: .....
6. Telephone number of exhibitor: .....

An Art and Hobby Exhibit will be held during the 173rd Annual Meeting of the Medical and Chirurgical Faculty. Physicians, their wives and families are asked to help make this exhibit an outstanding one with many interests on display. Anything made by the exhibitor is eligible and entries will be accepted until all exhibit space is allotted.

Entries should be delivered to the Baltimore Civic Center, Baltimore, between 9:00 AM and 4:30 PM on Tuesday, May 11, 1971. They must be removed on Friday, May 14, between 1:30 and 4:30 PM. The Faculty cannot carry insurance on your exhibit, but utmost care will be taken of it. There will be a watchman on duty when the meeting is not in session. Probably the exhibitors' personal policies will cover the exhibit. All entries should be submitted as early as possible.

A Hobby Corner at the Semiannual Meeting of the Faculty in Hershey created a great deal of interest. LET'S MAKE IT A REAL "SHOW" FOR THE 1971 ANNUAL MEETING. SUBMIT YOUR ENTRIES NOW!

MRS. ROBERT W. GARIS, EDITOR

woman's auxiliary

Letter from the President

Dear Doctor—Yes, YOU,

I often wonder if you ever take time to scan the auxiliary page of your state journal. It is designed with you in mind. If your wife is a member of the auxiliary, she receives her newsletter, HYGEIA FILIAE. If your wife isn't a member yet, I hope you are letting her peek in the journal to find out what we, as physicians' wives, are doing for you, her husband.

You really have an abundance of women working to help you in community programs, to stimulate interest in preventive medical care, to assist in immunization programs, and to try to improve your public image and that of your colleagues. We also attempt to foster good will and fellowship between physicians' families. As you well know, when one marries a doctor, he or she becomes an integral part of the medical profession whether they like it or not, and our individual actions reflect on our fellow members of the medical profession.

The purpose of the auxiliary page in the journal is to acquaint you with our programs and progress in specific areas. I believe you might like to know that we have active committees working on AMAERF, Children and Youth, Community Service, Disaster Preparedness-Safety, Doctor's Day (to show everyone how proud we are of you), Health Careers, International Health Activities, Legislation, and Mental Health, plus other committees concerned with public relations and the Auxiliary to the Student American Medical Association.

We have the programs designed to assist you; we have the enthusiasm to carry these programs out. We need your understanding of our purpose, and your wife's support. As with all volunteer work, more hands lighten the load.

May I just mention that if you've been taking a hard look at proposed legislation, attitudes of the news media, problems of communication, just to list a few, I don't need to tell you that our almost 1,000 members (out of a possible 3,800) are needed to do for you what *must* be done to improve relationships in all areas.

I strongly urge your wife to join us if she isn't a member yet. We need her support, her shoulder, and her talent to accomplish our goal of serving your community.

I'm glad I've had this opportunity to visit with you. The ensuing issues will tell you more about some of our programs. Please take time to read them.

Most sincerely yours,
Margaret Yow, President

Annual Fall Conference News

Amid bubbling good humor, congeniality, and the greeting of old friends, registration of delegates to the 27th Annual Fall Conference of the Woman's Auxiliary to the AMA occupied Sunday afternoon of October 11, 1970, in the French Room foyer of the Drake Hotel in Chicago, Illinois. Delegates were separated into four regional divisions: Eastern, Northcentral, Southern, and Western. Get-acquainted dinners were held that evening with each regional division assigned to a different dining room. Likewise, each regional division was given a separate meeting room throughout the conference.

After opening exercises and assorted greetings on Monday morning, October 12, the conference opened with the keynote address by Ernest B. Howard, MD, executive vice-president of the American Medical Association. His theme was an attempt to answer the question of maintaining the quantity of medicine while giving quality care and the accessibility or availability, or both, of such care. His presentation of

the AMA's "medicredit", with its inclusion of a Peer Review Organization (PRO) as against Senator Kennedy's National Health Insurance bill was, indeed, thought-provoking. I hope our Med-Chi members will have the opportunity of listening to Mrs. Yow's tape of the speech. Dr. Howard maintained that physicians must have an acceptable PRO plan ready to go into operation or be subject to a Federal Review Board. Senator Bennett of Utah has already presented a bill for medical review boards which would exclude physicians entirely.

Dr. Howard touched on several other subjects causing concern to the AMA. Among them was public relations. The AMA is considering an institutionalized advertizing campaign throughout the country which would be wholly positive and noncontroversial. Beginning in January 1971, the AMA will sponsor an hour-long TV program with Art Linkletter as master of ceremonies.

From political economics, we switched to home economics. Effie O. Ellis, MD, special assistant for Health Services to the AMA, earnestly told the assembled delegates that "nutrition controls how we feel, how we act and how we look". She developed this theme in a discussion-type presentation with AMA's Director of Foods and Nutrition, Philip White, ScD. They discussed the part that malnutrition in pregnancy may play in mental retardation, on the necessity of caloric balance in any attempt to increase male longevity, and the part overweight in infancy may play in the later development of obesity.

The president and president-elect of WASAMA then thanked Auxiliary members for their courtesies and friendships and for pointing the direction toward achieving their goal.

The morning session concluded with a defensive driving presentation by Mr. Raymond Martinez, Director of Training for the National Safety Council Driver Improvement Program. When he had finished his lively and vigorous delivery, most listeners felt that they wanted to enroll in a defensive driving course as soon as possible.

The President of the American Medical Association, Walter C. Bornemeier, MD, was the guest speaker at Monday's luncheon. His "tongue-in-cheek" presentation on "Relations—Family and Public" was received with laughter by some, and bewilderment by others.

The Monday afternoon session was devoted to a useful demonstration of the technique of presenting an Auxiliary package program. The program used was "Smoking". The speech "To Smoke or Not To Smoke", which is included in the package and is designed for delivery by a physician, was given by Mr. M. T. Enright, Director of the AMA's Speakers Program Department.

The Monday program ended with a dinner sponsored by the AMA Public Affairs Division and AMPAC. Mrs. John M. Chenault, former National Auxiliary President and now a member of the AMPAC Board of Directors, introduced the guest speaker, the Honorable Philip Crane, (R.), U.S. Congressman from Illinois' 13th Congressional District.

Tuesday's session commenced with an "Early Bird" Parliamentary Session, conducted by Mrs. Herbert L. Mantz, Parliamentarian. She stressed five rules that a presiding officer must observe: order, courtesy, justice, right of the minority to be heard, and the will of the majority to prevail. She firmly stated that all presiding officers must remember that power is invested in the office, not in the person presiding, and that all rulings must be made only at meetings. Mimeographed sheets on "The ABC's of the Presiding Officer" were distributed. Mrs. Yow hopes to have one for each county president.

At the conclusion of the parliamentary briefing, the delegates attended miniworkshops for the rest of the morning. Workshop topics were: Children and Youth; Home-Centered Health Care; International Health; Mental Health; Safety-Disaster Preparedness; and Publicity and Public Relations.

The Tuesday luncheon included a "Miss AMAERF" pageant produced by Mrs. Howard Ellis, AMAERF Chairman. The music was provided by Mrs. Virgil Ray Forester. This merry bit of nonsense was received delightedly and was a good example of what county AMAERF committees can do to publicize this project.

The Wednesday session began with a tour of the American Medical Association's headquarters at 535 N. Dearborn Street, Chicago. We were properly impressed by the computers and amazing electronic devices and had a quick peep at the AMA library. The remainder of the morning was devoted to audiovisual presentations in the AMA's ninth floor auditorium. The films shown are available to the counties on request.

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

May 12, 13, 14, 1971
Baltimore Civic Center

More space is available than in former years. However, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

_____

5. Has exhibit been shown at other medical meetings? _____

_____

6. Name and title of exhibitor: _____

_____

7. Name of institution cooperating in the exhibit: _____

_____

8. Address of exhibitor: _____

_____

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, MARYLAND STATE MEDICAL JOURNAL, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a maximum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the JOURNAL. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with JOURNAL style.

Statements made or opinions expressed by any contributor in any article or feature published in the JOURNAL are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

The actions of the official Tincture and Extract of Belladonna result chiefly from their Atropine content . . . conclude Goodman and Gilman

THE PHARMACOLOGICAL BASIS OF THERAPEUTICS
3rd Edition, page 522

ANTROCOL®

Antrocol provides the prompt, predictable antisecretory action of the belladonna alkaloid, atropine, fortified with sedation and blended with Bensulfoid, contributing to even absorption.

Each tablet or capsule contains: Atropine sulfate, 0.324 mg.; Phenobarbital, 16 mg. (may be habit forming); Bensulfoid, 65 mg. (see white section PDR). The atropine content of Antrocol is the maximum amount the average patient can take at six hour intervals over long periods with comfort.

SUPPLIED
Tablet in bottles of 100, 500 and 5000
Capsule in bottles of 100, 500 and 1000

Caution: Federal law prohibits dispensing without prescription.

PRESCRIBING INFORMATION

Contraindicated in glaucoma. Use cautiously in prostatic hypertrophy. Side-effects of toxic dose of atropine: flushing, dryness of mouth, cycloplegia, tachycardia and urinary retention.

DOSAGE: One tablet or capsule after each meal to correct emotional stress and normalize gastric secretions. In treating peptic ulcer, doses at regular intervals up to eight (8) tablets or capsules per day to provide the proper gastric titer for healing. After ulcer has healed, one tablet or capsule after each meal to maintain a titer unfavorable to recurrence.

Clinical supply available to physicians.

Clinical Extension of a pure Smooth Muscle Relaxant

TROCINATE®

Brand THIPHENAMIL HCl

400 mg./100 mg. S/C tablets

Trocinate relaxes all smooth muscles. Its direct action (musculotropic) does not involve the autonomic nervous system and it is not mydriatic. It is metabolized by the body and climinated in the urine as harmless degradation products. Trocinate has a remarkable history of freedom from side-effects.

When a pure direct-acting smooth muscle relaxant is indicated, Trocinate is the drug of choice.

DIARRHEA (functional) . . . *the first 400 mg. tablet usually relieves the discomfort of diarrhea so promptly that it ceases to be a bother.*

DIVERTICULITIS—MUCOUS COLITIS . . . *the accompanying discomforts can be relieved by this direct smooth muscle relaxant.*

BLADDER SPASM . . . *relaxation is immediate. One or two tablets condition the bladder for cystoscopy in one hour.*

SPASTIC URETER . . . *the specific relaxing effect of Trocinate on the spastic ureter has been proven by animal studies and affirmed clinically. (J. Urol. 73:487-93)*

PRESCRIBING INFORMATION

WARNING: Do not give in advanced kidney or liver disease. PRECAUTIONS: Trocinate relaxes all smooth muscles. Large dosage or prolonged usage may cause feeling of weakness or can theoretically precipitate gall-bladder colic, due to relaxing the vascular and duct systems. Caution should be observed in patients with urinary bladder obstruction. DOSAGE: 400 mg. May be repeated in 4 hours. After relief, lengthen the dose frequency. (see side note)

NOTE: *The high therapeutic index of Trocinate permits its administration in dosage sufficient to relieve smooth muscle spasm promptly. 400 mg. dosage usually creates a therapeutic blood level. In reducing dosage after relief, lengthening the time between dosage rather than lessening the recommended dose is preferable. The prompt direct action allows a consciousness of the first suggestion of return of symptom . . . a guide to dose spacing and to determining when treatment is complete. A prescription for twelve or sixteen 400 mg. tablets will usually correct spasm and leave a few tablets for a reserve.*

MEDICAL NEWS

Arthur Rudolph Bergman, MD, of Takoma Park, has recently become a Fellow of the American College of Anesthesiologists.

* * *

Emerson Coleman Walden, MD, President of the Maryland Medical Association, was recently chosen president-elect of the National Medical Association at its 75th Anniversary Diamond Jubilee Convention in Atlanta.

Dr. Walden is a former chairman of the board of trustees and a member of the executive committee of the NMA.

* * *

The use of medication to calm overactive school children is strictly a medical matter, according to **Neil Solomon, MD, PhD,** Maryland's Secretary of Health and Mental Hygiene. Dr. Solomon stated that he was responding to a number of inquiries he has received regarding this practice.

According to Dr. Solomon, "Medical treatment is a matter for the personal relationship of the physician and the patient. Any other procedure for the administering of this or any similar drug would be contrary to Maryland law."

* * *

A team of physicians from The Johns Hopkins Hospital won first place for their scientific exhibits at the 75th Annual Meeting of the American Academy of Ophthalmology and Otolaryngology, held recently in Las Vegas.

Arnall Patz, MD, Stephen J. Ryan, MD, Edward Maumenee, MD, Krishnamurthy Sankaranaryanan, MD, and **Terry W. George, MD,** presented the exhibit, "Argon Laser Photocoagulation."

* * *

Members of the **American Academy of Pediatrics' Committee on Environmental Hazards** recently testified before the Senate and House Banking and Currency Committees in support of legislation to eliminate lead-based paint from housing so that the incidence of childhood lead poisoning might be reduced and ultimately abolished.

* * *

William M. Heller, PhD, Bethesda, was recently named the executive director and secretary of the United States Pharmacopeia Convention. This is a newly created post.

Dr. Heller

* * *

The American Academy of Pediatrics recently requested the formation of a **National Advisory Council on Children,** which would be responsible to the President of the United States. The Academy also called for the creation of a voluntary multidisciplinary national health service corps, and a national health insurance program to insure comprehensive coverage for all children.

* * *

Robert C. Abrams, MD, was the chairman and a participant in the James Lawrence Kernan Hospital's 75th anniversary session and banquet held recently.

Among the fourteen physicians presenting papers on modern surgery, treatment, and management of severe orthopedic cases were: **J. Scott Decker, MD, Baltimore; Liebe S. Diamond, MD, Baltimore; Robert E. Chambers, MD, Bethesda; George W. Wharton, MD, Baltimore; T. Hugh Morgan, MD, Baltimore; and W. Haddox Sothoron, MD, Baltimore.**

May 31, 1971, has been set by Neil Solomon, MD, PhD, Maryland's Secretary of Health and Mental Hygiene, as the target date for the completion of a state-wide massive rubella immunization. Half a million children, from ages 1 through 12, have not yet received this immunization.

Harry M. Meyer, Jr., MD, and Paul D. Parkman, MD, of the Division of Biologics Standards of the National Institutes of Health, Bethesda, the two physicians who developed the rubella vaccine, joined with Dr. Solomon recently at a press conference to discuss the efficacy of the vaccine and the progress on a national level of the rubella eradication program.

* * *

Communication between The Johns Hopkins' house staff, clinical fellows, and administration were strengthened recently when these three groups agreed to the formation of **The Johns Hopkins House Staff Society.** The Society was created to keep the house staff and fellows in-

formed of administrative policy decisions, and to give the house staff greater participation in those decisions.

Officers of the society are: Pat Brookhauser, MD, ENT, president; Sandy Wise, MD, urology, vice-president; Jeff Neill, MD, medicine, secretary; and Jess Thoene, MD, pediatrics, treasurer.

* * *

Stephen B. Hameroff, MD, Ricardo Garcia-Mullin, MD, and John Eckholdt, MD, all of Baltimore, authored an article entitled "Ocular Bobbing" in the October issue of the *Southern Medical Journal.*

* * *

Physicians are urged to request that their patients secure adequate immunization for their children against diphtheria. **Howard Garber, MD,** Chief of the Division of Communicable Diseases, State Health Department, and **Neil Solomon, MD, PhD,** Maryland's Secretary of Health and Mental Hygiene, stated that the outbreak of the disease in Texas has caused some concern here.

Maryland's percentages of DTP (Diphtheria, Tetanus, and Whooping Cough) vaccine administration, however, remain well above the national averages.

* * *

Jacob H. Conn, MD, Assistant Professor Emeritus of Psychiatry at The Johns Hopkins University School of Medicine, received the Gold Medal Award for his contributions to Scientific Hypnosis at the 22nd Annual Meeting of the Society for Clinical and Experimental Hypnosis, held in Philadelphia recently.

Some of Dr. Conn's achievements include developing the Play Interview treatment of fearful children as well as pioneering treatment for sex offenders and sociopaths. He has also authored 105 publications in the fields of psychotherapy, child psychiatry, and hypnosis.

* * *

Robert P. Madden, MD, Chief of the Far Ultraviolet Physics Section of the National Bureau of Standards, was the recipient of the 1970 Stratton Award, it has been announced.

Dr. Madden, who received his PhD from The Johns Hopkins University, was cited for "imaginative use of a high-energy accelerator to open a new and rewarding field of atomic structure research." He resides in Mt. Airy.

* * *

Robert W. Gibson, MD, Medical Director of Sheppard and Enoch Pratt Hospital, delivered the Annual Strecker Award Lecture at the Institute of the Pennsylvania Hospital recently.

At this time, too, Dr. Gibson received the Institute's 1970 Strecker Award in recognition of his concern for patient care and treatment.

* * *

Allan C. Barnes, MD, Baltimore, was elected a nonrotating member of the Executive Board of the Fellows of Obstetricians and Gynecologists at their recent World Congress held in New York.

Dr. Barnes is also a member of the Joint Study Group on the Training and Practice of Midwives and Maternity Nurses.

* * *

The Centurion Club of the Deafness Research Foundation recently announced its list of Maryland professional members. They include: **Cyrus L. Blanchard, MD; John E. Bordley, MD; G. H. Conner, MD; G. T. Nager, MD;** and **M. Lee Williams, MD.**

The Centurion Club's primary purpose is to raise funds to underwrite the administrative costs of the Deaf Research Foundation through annual membership dues from ENT specialists and their professional societies. Support from the medical profession allows other funds received by the Foundation to be used for research and related objectives. The **Maryland Ear, Nose and Throat Society** supports the club.

* * *

David E. Rogers, MD, Dean of the Medical Faculty of The Johns Hopkins University, will be an active participant in a two-day colloquium on the future role of university-based metropolitan hospitals to be held during New York Hospital's 200th anniversary next year.

* * *

The Maryland Society of Internal Medicine recently elected its new officers: They are: President, **Vernon M. Smith, MD;** President-elect, **Gordon Cader, MD;** and Secretary-Treasurer, **Wilmer K. Gallager, Jr., MD.**

Council members elected are: **Barnett Berman, MD; Katherine H. Borkovich, MD; Marvin H. Davis, MD; Thaddeus E. Prout, MD; Martin L. Singewald, MD; and William G. Speed, III, MD.**

* * *

Thomas E. Andreoli, MD, has been appointed director of the Division of Nephrology, Department of Medicine, School of Medicine at the University of Alabama. Dr. Andreoli had formerly served with the Gerontology Section of the National Institutes of Health at Baltimore City Hospitals.

The federal government has assumed the bulk of the personal health care bill for persons aged 65 and over since the inception of Medicare four years ago.

In fiscal year 1969, for example, the average annual medical bill for each aged person was $692, but the average older person's out-of-pocket outlay was only $163, according to Social Security Administration figures.

* * *

Theodore A. Hussey, a former executive in the U.S. Navy Surgeon General's office, has been named assistant director of planning by The Johns Hopkins Medical Institutions.

Mr. Hussey will help develop long-range plans for The Johns Hopkins Hospital School of Medicine and School of Hygiene and Public Health.

* * *

Mead Johnson Laboratories will sponsor a Cancer Chemotherapy Program in 1971.

The Program will consist of lectures to be given by outstanding medical authorities in the field of cancer chemotherapy. Fourteen physicians, all with hospital, university, or clinic affiliations, will deliver the lectures.

Mead Johnson Laboratories will make arrangements for speaker procurement and will defray expenses for honoraria, travel, and lodging. Medical organizations interested in obtaining one of the speakers should contact: Martin E. Vancil, MD, Associate Director, Medical Research Department, Mead Johnson & Company, Evansville, Indiana 47721.

* * *

Eli Lilly and Company is prepared to do anything within its power to help solve the problem of the use of empty gelatin capsules in the heroin trade, according to **Henry F. DeBoest,** vice-president of corporate affairs.

Testifying before the House of Representatives Select Committee on Crime, DeBoest said that the company has procedures aimed at ensuring that its output of empty capsules remains in legitimate channels.

Wholesalers had been asked to screen their orders from retailers in order to satisfy themselves that there was a legitimate need for the products. In addition, the company was screening orders from its wholesalers when quantities in their orders appeared unusual.

DeBoest pointed out that production of the number five small capsule, which reportedly was being used for packaging heroin, represented less than 1% of the company's total capsule production.

Children with diabetic blood relatives develop diabetes at a much higher rate than do children who do not have diabetic blood relatives, according to a report in the current issue of the *Disease Detection Newsletter.*

The report highlights the findings of a pilot project started at the University of Missouri's School of Medicine.

* * *

A stay at The Johns Hopkins Hospital is less frightening to sick children these days thanks to a coloring book that tells what to expect.

The coloring book, published with support from the Women's Board of the Hospital, is given free to all children admitted, and may also be purchased in the gift shop.

Written by **Mrs. Barbara Schuyler Hass,** former director of Child Life Development at Hopkins, the book is illustrated by Lun Harris of the Maryland Institute of Art.

The book's 45 pages are full of easily understandable advice for hospitalized youngsters. In addition, there is a hospital scene to color on every other page.

* * *

Additional federal funds for rubella vaccine, totaling nearly $269,000, have been assured Maryland for the coming fiscal year.

This extra financial assistance should enable the state to complete the important job of eradicating German measles, which the medical community began last year.

According to **Karl Green, MD,** chairman of the Steering Committee on Immunization Practices of the Medical and Chirurgical Faculty of Maryland, the state medical society fully endorses this type of program in order to insure the protection of those still susceptible to the disease.

* * *

The Diabetic Health Center for Children recently opened at **Happy Hills Hospital** here. The purpose of the center is to provide diabetic children and their families with a continual pro-

gram of education based on specific needs of each patient and family. The program will enroll private and indigent ambulatory patients who are not acutely ill, and will stress the proper methods of dietary care, insulin injection techniques, urine testing, and parental attitudes in the general care of the child with diabetes.

The program has the approval of the Maryland Diabetes Association and the State Health Department. It will be under the supervision of a full professional staff.

Referrals may be made to Robert B. Schultz, MD, Diabetic Health Center for Children, 1708 West Rogers Ave., Baltimore, Md. 21209.

A *Bibliography of Sports Medicine* has been published by the American Academy of Orthopaedic Surgeons.

Compiled by the Academy's Committee on Sports Medicine, the 96-page volume is identified as an introduction to the interdisciplinary literature for physicians and others handling athletes and athletic programs.

The book is available at $2 a copy with quantity discounts. Write: Publications Committee, American Academy of Orthopaedic Surgeons, 430 North Michigan Ave., Chicago, Ill. 60611.

* * *

The American Cancer Society has commended **Maryland Blue Cross and Maryland Blue Shield** for their public service advertising campaign in radio, TV, and newspapers aimed at creating public awareness of the need for periodic cancer checkups.

Edward F. Lewison, MD, past president of the Maryland Division of the American Cancer Society, and chief of the Breast Cancer Clinic at The Johns Hopkins Hospital, presented a special citation to Blue Cross officials. It cited the health insurance company for setting an example which could be followed by many advertisers in bringing important health problems to the attention of Maryland citizens.

The President of the American Cancer Society, **Jonathan Rhoads, MD,** joined Dr. Lewison in making the presentation.

Receiving a special citation from the American Cancer Society for their corporation's advertisements promoting cancer checkups are, from left, Thomas Sherlock, Senior Vice-President of Maryland Blue Cross and Denwood Kelly, President of Maryland Blue Shield. Presenting the special citation is Edward F. Lewison, MD, Past President of the Maryland Division of the American Cancer Society. Looking on is Jonathan Rhoads, MD, President of the national American Cancer Society, Inc.

Moses S. Koch, former president of Essex Community College, joined The Johns Hopkins Hospital staff recently as the hospital president's Consultant for Allied Health Education Planning.

Dr. Koch will review all existing Johns Hopkins programs in the allied health sciences. He will work with universities, junior colleges, and public schools to develop broader and better educational programs in medical technology, radiologic technology, nursing and other paramedical health professions.

The **Direct Relief Foundation** announces available information for those physicians who are interested in working in or visiting hospitals overseas.

Presently, work assignments are available in Central and South America, The Far East, South Asia, and Africa.

For information, write: Direct Relief Foundation, 27 East Canon Perdido St., Santa Barbara, Calif. 93101.

* * *

A recent monograph from the Institute of Rehabilitation of the New York University Medical Center entitled *Urological Nursing Procedures, Rehabilitation Monograph 43,* summarizes the latest techniques in the management of incontinent patients. The publication, aimed at both medical and paramedical personnel and at the patient himself, reflects ten years of research and clinical experience at the Institute of which **Howard A. Rusk, MD,** is the director.

Written by **John Whelan, RN,** nursing supervisor in urology, in cooperation with **Ellen Coffman, RN,** director of nursing, and **Rosario Donnarumma, MD, RN,** formerly assistant director of nursing education, the monograph includes explanation of various treatment procedures, appliances, and personal hygiene.

It may be purchased for $2 a copy from the Publication Office, Institute of Rehabilitation Medicine, 400 East 34th St., New York, N.Y. 10016. Make checks payable to New York University Medical Center.

* * *

As an initial step in tightening Maryland's regulation of nursing homes, and to provide additional guidance and assistance to nursing home operators, **Neil Solomon, MD, PhD,** Secretary of Health and Mental Hygiene, announced the appointment of **Ferdinand A. Korff** as Special Consultant on Food Hygiene.

Mr. Korff, who served from 1933 to 1965 as Director of the Bureau of Food Control of the Baltimore City Health Department, will undertake the studies of adequacy of food purchasing, preparation, and distribution procedures within nursing home facilities.

* * *

The continually increasing demand for health personnel on all levels, opportunities for career advancement, and the personal satisfaction of helping others are featured in **"Horizons Unlimited,"** a 28-minute color film available for loan from the State Department of Health and Mental Hygiene.

This film may be borrowed without charge from the Film Services, Maryland State Department of Health and Mental Hygiene, 301 West Preston Street, Baltimore. (Phone: 383-3010, ext. 8516.) Time should be allowed to preview and to arrange for a discussion leader.

* * *

The National League for Nursing has urged the Department of Defense to offer all registered nurses, regardless of their educational backgrounds, equal opportunity to become commissioned officers in the armed services.

At present, Department of Defense regulations limit nurse officer candidates to graduates of nursing education programs of at least 27 months in length. This eliminates from officer candidacy nurses who graduate from junior and community college nursing programs with an associate degree, and graduates of some hospital diploma nursing schools which have shortened their curriculums.

* * *

The Institute of International Education announces the opening of its annual competition for grants for graduate study or research abroad, and for professional training in the creative and performing arts.

The grants, which will be available for the academic year 1971-1972, are designed to promote mutual understanding between the people of the U.S. and other countries through the exchange of persons, knowledge, and skills. It is expected that there will be at least 554 awards available for this period.

For more information, write: Institute of International Education, 809 United Nations Plaza, New York, N.Y. 10017.

The Ortho Division of Chevron Chemical Company is advertising in a different kind of medium this fall because they have an unusual message.

The medium is the *Journal of the American Medical Association* and the product is concern. Through its ad, Ortho is offering free distribution of the U.S. government publication, "Directory, Poison Control Centers."

Write: Chevron Chemical Company, 200 Bush Street, San Francisco, Calif. 94104.

* * *

THE MONTH IN WASHINGTON

The American Medical Association challenged charges of widespread tax cheating by physicians and renewed its offer to cooperate with the government in cracking down on dishonest physicians.

In letters to Sen. Russell B. Long (D., La.), Chairman of the Senate Finance Committee, Walter C. Bornemeier, MD, President of the AMA, answered the tax-cheating charges, and Ernest B. Howard, MD, Executive Vice-President of the AMA, renewed the offer of cooperation. But Dr. Howard also said that mandatory reporting of unassigned fees by insurance agencies would be an ineffective and unfair way to try to uncover physicians cheating on their income taxes on payments for their services under medicare and medicaid.

The tax-cheating resulted from testimony given by Meade Whitaker, who then was tax legislative counsel for the Treasury Department, at a hearing of the Senate Finance Committee during its consideration of changes in the medicare and medicaid programs. He said that many providers of services under the two health care programs might have "substantial deficiencies" in their income tax returns.

In a letter to Sen. Long and Sen. Wallace F. Bennett (R., Utah), a ranking minority member of the finance committee, Dr. Bornemeier said that the charges had been widely distorted in the press and that these reports do the medical profession a serious injustice.

Whitaker testified that from an original list of returns from 11,000 physicians who received payments of $25,000 or more for services rendered under medicare and medicaid in 1968, 4,000 returns warranted a detailed audit by the IRS.

With preliminary audits completed on 3,000 of the 4,000 returns, there were indications that 1,500 of these showed "substantial deficiencies", the Treasury reported. "Substantial deficiencies later were defined as being underpayments of more than $100.

Dr. Bornemeier said that this testimony was being widely interpreted to mean either that one third of the medical profession was cheating (4,000 of 11,000 cases to be audited) or that one half of the profession was cheating (1,500 alleged offenders from 3,000 actual audits)

"Assuming the worst—that 1,500 doctors out of 11,000 are guilty of income tax irregularities—the correct proportion would be between 13% and 14% rather than 33% or 50%," Dr. Bornemeier said.

The AMA President called on the Treasury Department to be specific in their charges, since the interpretation by the press growing out of their testimony reflected on the profession as a whole.

"As of now," he continued, "there seem to be 1,500 cases where substantial deficiencies may exist. I think we should know what proportion of these cases simply represents cause for further examination and what proportion represents cases that may realistically be expected to end up with the fraud division of the IRS.

"I think we should know what proportion of the serious cases involve physicians. I suspect the figures given include osteopaths, dentists, pharmacists, and optometrists and others eligible to receive medicare-medicaid payments."

Dr. Bornemeier told Sen. Long that his request for documentation of these cases was not a defense for the dishonest physician or anyone else who attempts to falsify an income tax return.

"We are on record," the Chicago physician said, "as requesting examples of wrongdoing by doctors receiving payments under government health programs so that we may take action of our own."

Dr. Howard said that "the dishonest or incompetent physician hurts us just as much as he harms his government."

Dr. Howard also said that a recent statement by Sen. Long that the AMA had been "completely forthright and honorable, and sought to shield no one" is "exactly our position."

The AMA official also noted that Sen. Long, at a recent hearing of the finance committee, had referred correctly to previous requests by the AMA that it be given examples of suspected chicanery by physicians in government health programs "so that we might take our own action".

As for mandatory reporting of unassigned medical payments—those given to the patient rather than to the physician—Dr. Howard said such a requirement "would not provide the Internal Revenue Service with helpful and meaningful data". He urged rejection of such an amendment proposed by the Treasury Department. A joint House-Senate conference committee rejected it last year in considering tax reform legislation.

The Treasury Department proposed that Blue Cross-Blue Shield organizations, medicare and medicaid agencies, and other health insurance carriers be required to report unassigned payments for medical services.

Dr. Howard pointed out that millions of patients have more than one health insurance policy and may collect total benefits exceeding the physician's charge, and that some patients may not even use the insurance payment to compensate the physician. Physicians also would have to set up costly additional bookkeeping record procedures to list separately and in detail each charge to a patient in excess of $25, the AMA official said.

"The proposal of the Treasury Department would place physicians in a unique category under our tax laws," Dr. Howard said. "We know of no other provision in the tax laws which singles out one class of individual taxpayers, requiring payers to report to the IRS individual payments made to taxpayers as well as the annual aggregate amount of such payments.

"We believe . . . that the proposed . . . amendment is unfair and discriminatory and would do little to accomplish any goal for an improved system. Instead, as an additional cost burden, it would place further pressure on the cost of medical care."

* * *

President Nixon, at a bill-signing ceremony, praised the new Drug Abuse Act for providing "a forward looking program" for treatment of drug addiction as well as strengthening the government's law enforcement powers in the field.

The new law provides for the Department of Health, Education, and Welfare to run extensive programs for the treatment and rehabilitation of drug users and for antidrug education. It authorizes HEW's National Institute of Mental Health to spend $189 million over three years to build and staff treatment facilities, to support rehabilitation programs, and to increase antidrug education programs. Another $1 million is authorized for creation of a presidential commission of marijuana.

State comprehensive health plans getting federal aid must now include drug abuse programs, and an Administration spokesman suggested that all states model their drug control laws on the federal statute.

Before final passage, Congress modified the original legislation to meet many of the objections of the medical profession against a proposal that would have allotted most classification powers and research control to the Justice Department. The attorney general can declare drugs as dangerous but he is bound by HEW's medical and scientific evaluations.

The strengthened enforcement provisions are aimed at the drug pusher with lighter penalties for drug possession, particularly by minors. Federal first offense cases for drug users are lowered from felonies to misdemeanors. Under this provision, a person found guilty of possessing marijuana for the first time will not necessarily be subjected to an automatic stiff jail sentence. But to facilitate arrest of pushers, the controversial "no-knock" clause was retained.

Requirements as to records kept by physicians remain the same as under the old narcotics law except where the physician regularly dispenses a nonnarcotic drug and charges for it.

The new law broadens the former narcotics statute to include, with varying restrictions and controls, amphetamines, barbiturates, and other drugs ruled dangerous. At the start, controls will be drastically tightened over marketing the liquid form of

It's not too soon to make reservations for
Med-Chi's Annual Meeting
May 12, 13, 14, 1971
Call or write the Faculty office for information

amphetamines which can be taken by injection.

Companies producing or distributing a long list of commonly prescribed stimulants, depressants, and tranquilizers will be subject for the first time to federal registration requirements. The Narcotic Bureau also now has a new power to set production quotas for such nonnarcotic drugs.

C. Joseph Stetler, president of the Pharmaceutical Manufacturers Association, praised Congress and the Administration for enactment of the law:

"Drug abuse has become a frightening problem for millions of Americans. It is absolutely proper for the federal government to exercise this type of aggressive leadership to stem the use of physically and psychologically damaging illicit substances, to control the misuse of legitimate medicines produced for the health and welfare of citizens, and to support rehabilitative needs for victims of the drug problem."

Other health legislation recently enacted into law included:

—The Communicable Disease Control Act of 1970 which authorizes expenditure of $210 over the next three years for vaccination and other control programs against tuberculosis, venereal disease, German measles, measles, polio, diphtheria, tetanus, whooping cough, Rh disease, and other diseases judged by the Secretary of Health, Education, and Welfare to be major problems.

—The Regional Medical Programs and Comprehensive Planning and Services Act of 1970 extending the programs for three years with authorized spending of $545 million for RMP and $52 for CHP. Further appropriations totalling $961.5 million were made for project grants for areawide health planning; training, studies, and demonstrations; comprehensive public health services; and health services development. RMP is expanded to include kidney disease. The new law provides for a systems analysis of national health care plans and for a cost and coverage report on such legislation. A National Advisory Council on Comprehensive Health Planning Programs is created.

—The Health Training Improvement Act of 1970 which extends the allied health educational program for three years with aid to schools and students. Authorized appropriations total $308.5 million. The maximum yearly loan will be $1,500 and the maximum aggregate loan, $6,000, for any student. A forgiveness of up to 50% will be allowed if the student practices in a shortage area or for a nonprofit organization after graduation.

—The Developmental Disabilities Services and Facilities Construction Amendments of 1970 extending the mental retardation facilities construction program for three years and expanding it to include grants for planning, provision of services, and construction and operation of facilities for persons with developmental disabilities. Authorized appropriations total $295 million.

Campbell's Soups... wide variety...for limited appetites

Many people lose interest in food as they grow older. Some of them are fussy eaters—with only a few favorite foods. Others become indifferent to foods—because planning and preparing meals becomes a chore. Here Campbell's Soups can help —for these four very good reasons:

Appeal With a variety of tastes, textures, aromas, and colors, Campbell's Soups can add interest and appetite appeal. And they're easy to eat—ingredients are tender, bite-size. Even patients on special diets will find soups they can enjoy among the more than 50 different varieties available.

Nourishment Campbell's Soups contain selected meats and sea foods, best garden vegetables—carefully processed to help retain their natural flavors and nutritive values.

Convenience Within 4 minutes a bowl of delicious soup is heated and ready to eat.

Economy Campbell's Soups are inexpensive—an important consideration to those whose budgets are limited.

Recommend Campbell's Soups . . . and, of course, enjoy them yourself. Remember, *there's a soup for almost every patient and diet . . . and for every meal.*

THE STOPPER

LOMOTIL®

tablets/liquid

Each tablet and each 5 cc. of liquid contain:
diphenoxylate hydrochloride .....2.5 mg.
(Warning: May be habit forming)
atropine sulfate .....0.025 mg.

first aid in diarrhea of acute gastroenteritis

PROMPT ANTIDIARRHEAL ACTION

Roentgenographic studies demonstrate that the motility-lowering activity of Lomotil is concentrated in the first three hours and continues for at least six hours.

Clinical investigators have found ample confirmation of these determinations. Lomotil has reduced diarrheal urgency in many patients within one hour.

OPTIMAL ANTIDIARRHEAL CONTROL

Numerous investigators have remarked on the high degree of effectiveness of Lomotil in a variety of diarrheal disorders. Lomotil has given good to excellent relief of symptoms in many patients who had failed to respond to other measures.

UNSURPASSED ANTIDIARRHEAL ACCEPTANCE

Patients prefer Lomotil for its convenience, its prompt control of diarrhea and its relief of cramping and urgency. Physicians specify Lomotil for its dependable action and its relative freedom from side effects when taken as directed.

Warnings: Lomotil should be used with caution in patients taking barbiturates and, if not contraindicated, in patients with cirrhosis, advanced liver disease or impaired liver function.

Precautions: Lomotil is a federally exempt narcotic with theoretically possible addictive potential at high dosage; this is not ordinarily a clinical problem. Use Lomotil with considerable caution in patients receiving addicting drugs. Recommended dosages should not be exceeded, and medication should be kept out of reach of children. Signs of accidental overdosage may include severe respiratory depression, flushing, lethargy or coma, hypotonic reflexes, nystagmus, pinpoint pupils, tachycardia; continuous observation is necessary. The subtherapeutic amount of atropine sulfate is added to discourage deliberate overdosage.

Adverse Reactions: Side effects reported with Lomotil therapy include nausea, sedation, dizziness, vomiting, pruritus, restlessness, abdominal discomfort, headache, angioneurotic edema, giant urticaria, lethargy, anorexia, numbness of the extremities, atropine effects, swelling of the gums, euphoria, depression and malaise.

Overdosage: The medication should be kept out of reach of children since accidental overdosage may cause severe, even fatal, respiratory depression.

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are as follows:

Children:

3-6 mo. . . ½ tsp.* t.i.d. (3 mg.)
6-12 mo. . . ½ tsp. q.i.d. (4 mg.)
1-2 yr. . . . ½ tsp. 5 times daily (5 mg.)
2-5 yr. . . . 1 tsp. t.i.d. (6 mg.)
5-8 yr. . . . 1 tsp. q.i.d. (8 mg.)
8-12 yr. . . 1 tsp. 5 times daily (10 mg.)
Adults: . . . 2 tsp. 5 times daily (20 mg.) or 2 tablets q.i.d.

*Based on 4 cc. per teaspoonful.

Use of Lomotil is not recommended in infants less than 3 months of age.

Maintenance dosage may be as low as one-fourth the initial daily dosage.

in cardiac edema

Dyazide®

Trademark

Each capsule contains 50 mg. of Dyrenium® (brand of triamterene) and 25 mg. of hydrochlorothiazide.

gets the water out

spares the potassium

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.

Indications: Edema associated with congestive heart failure, cirrhosis of the liver, the nephrotic syndrome, late pregnancy; also steroid-induced and idiopathic edema, and edema resistant to other diuretic therapy. 'Dyazide' is also indicated in the treatment of mild to moderate hypertension.

Contraindications: Pre-existing elevated serum potassium. Hypersensitivity to either component. Continued use in progressive renal or hepatic dysfunction or developing hyperkalemia.

Warnings: **Do not use dietary potassium supplements or potassium salts unless hypokalemia develops or dietary potassium intake is markedly impaired.** Enteric-coated potassium salts may cause small bowel stenosis with or without ulceration. Hyperkalemia (>5.4 mEq/L) has been reported in 4% of patients under 60 years, in 12% of patients over 60 years, and in less than 8% of patients overall. Rarely, cases have been associated with cardiac irregularities. Accordingly, **check serum potassium during therapy, particularly in patients with suspected or confirmed renal insufficiency (e.g., certain elderly or diabetics). If hyperkalemia develops, substitute a thiazide alone. If spironolactone is used concomitantly with 'Dyazide', check serum potassium frequently**—they can both cause potassium retention and sometimes hyperkalemia. Two deaths have been reported in patients on such combined therapy (in one, recommended dosage was exceeded; in the other, serum electrolytes were not properly monitored). Observe regularly for possible blood dyscrasias, liver damage or other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving Dyrenium (triamterene, SK&F). Rarely, leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with the thiazides. Watch for signs of impending coma in acutely ill cirrhotics. Thiazides are reported to cross the placental barrier and appear in breast milk. This may result in fetal or neonatal hyperbilirubinemia, thrombocytopenia, altered carbohydrate metabolism and possibly other adverse reactions that have occurred in the adult. When used during pregnancy or in women who might bear children, weigh potential benefits against possible hazards to fetus.

Precautions: Do periodic serum electrolyte and BUN determinations. Do periodic hematologic studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in postsympathectomy patients. The following may occur: hyperuricemia and gout, reversible nitrogen retention, decreasing alkali reserve with possible metabolic acidosis, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), digitalis intoxication (in hypokalemia). Use cautiously in surgical patients. Concomitant use with antihypertensive agents may result in an additive hypotensive effect.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis; rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting (may indicate electrolyte imbalance), diarrhea, constipation, other gastrointestinal disturbances. Rarely, necrotizing vasculitis, paresthesias, icterus, pancreatitis, and xanthopsia have occurred with thiazides alone.

Supplied: Bottles of 100 capsules.

Introduction: The Need for Continuing Education

At the Frederick Memorial Hospital, a program recognizing the need for continuing education has been developed. This unique program seeks to afford intellectual stimulation to the medical community of Frederick.

ROBERT J. THOMAS, MD,
Department of Surgery
Frederick Memorial Hospital

The practice of medicine is a demanding intellectual taskmaster. The termination of formal training is but the beginning of a life-long program of continuing medical education. Nowhere is the need and urgency of such a continuing habit so accentuated as the medical environment of a small community. Hospital practice without house staff imposes a heavier physical burden on the practicing physician and denies him, at the same time, the intellectual stimulation afforded by the presence of house staff.

Faced with the reality of the situation, each location engineers its solution. At the Frederick Memorial Hospital, the program contrived is quite unique. Developed over many years of trial, it has succeeded in meeting the need for continuing education.

The heart of the program is a Postgraduate Education Committee which steers the entire program, with representation from all of the services. A system or subject is selected for staff review and study two years in advance. Topics are selected and speakers procured for a monthly meeting. This speaker from a medical center is payed an honorarium and the talk is transmitted over the MEDIC Network. It has become a tradition to precede the talk with a buffet luncheon.

The monthly talks begin in September of each year. During the preceding summer months, at each department meeting, films are programmed on the subject to be under study that year. This conditioning process prepares the staff for the year's topic.

The department meetings for the following ten months are organized to permit quarterly death conferences or perinatal mortality conferences, CPC's, and half-hour presentations by members of the staff on subjects centered on the main theme of the year, and pertinent to their department preoccupation.

The articles appearing in this issue are portions of talks presented by members of the staff in the course of this programming.

At the risk of sounding vain, our program seems to work for us. The aim of the program is the involvement of every member of the staff. The commodity that makes it possible is their enthusiasm and sympathy. The staff is particularly grateful to the administrator, Mr. Charles A. Markel. His dependable sympathy and support have helped us in many ways.

The purpose of this article is to discuss histoplasmosis as it is found in Maryland, Virginia and, more recently, the District of Columbia. I concern myself not only with a presentation of some scientific studies made in these areas, but attempt to acquaint you with some of the history of the disease that should be of interest to those who practice in the area covered by MEDIC. Some comments concerning diagnosis are included and, finally, a few general remarks are offered about the treatment of the disease.

Histoplasmosis

HENRY V. CHASE, MD
Department of Medicine
Frederick Memorial Hospital

Histoplasmosis, a highly infectious but noncontagious disease, is found throughout most of the world but it appears to be most prevalent in the United States. It is estimated that there are over 30 million persons in the United States who have had the disease and an average of 500,000 individuals are infected annually. Most of the basic research and clinical reports have been made on patients observed in this country.

Formerly, the endemic area was thought to be limited to the Mississippi River Basin but it is now known that the incidence is just as high in most of the area drained by the Potomac River. The endemic area extends into Maryland, Virginia, and parts of southern Pennsylvania.

Although the area in which we live is on the periphery of high endemicity, it was the center of many early, important, historical events.

The Discoverer

Samuel Taylor Darling, MD, discovered and described histoplasmosis at the very onset of his career. He was graduated from the College of Physicians and Surgeons of Maryland in 1903 with the honor medal for highest rank in a class of over 70. This school was one of seven in Baltimore at that time. After the Flexner report of 1910, his school merged with the University of Maryland School of Medicine.

After graduation, Darling spent two years as resident pathologist at the Baltimore City Hospitals. After competing his training, he joined the United States Public Health Service and requested duty in Panama where the canal was then being built.

Within four months after reaching the Canal Zone, he discovered the disease while doing routine autopsies on laborers who had died and were found to have had greatly enlarged or "Columbian" spleens. The first case report was published in 1906 by the AMA. Since the organisms appeared to be large, encapsulated plasmodium, engulfed by histocytes, he named the parasite "Histoplasma capsulata". His first patient was a young carpenter who was a native Martinque.

Two other fatal cases were found during the following year and, in 1907, Darling returned to his alma mater and reported on what he thought was the first series of a New World type of Kalaazar. His paper was given at Mercy Hospital in January 1907 and was published in the April 1907 issue of the *Maryland State Medical Journal.*

Darling returned to Panama where he was Director of Laboratories at the Ancon Hospital until 1915, but failed to discover another case of histoplasmosis there. He attributed this to the vast improvement in sanitary conditions achieved during the construction of the canal. During later years, Darling returned to Baltimore frequently and his family lived there and in Virginia while he traveled for long periods in Africa and Asia.

From 1917 to 1920, he and his family lived in Sao Paulo, Brazil, where he established and directed a school of hygiene under the Brazilian government and the Rockefeller Foundation.

Again, in 1920, he returned to Baltimore, but this time, he was seriously ill and was admitted to The Johns Hopkins Hospital. For several months he was under the close observation of Walter Dandy, MD, and finally, a benign brain tumor was surgically removed and he regained his health. During almost two years of convalescence, he worked at The Johns Hopkins School of Hygiene. During this time, he received an honorary degree of ScD from the University of Maryland.

His reputation as an international authority on malaria prompted the Rockefeller Foundation to ask him to establish a field laboratory at Leesburg, Georgia, for the investigation of malaria and malaria control. In 1925, he agreed to serve as a member of a Malaria Commission for the League of Nations and while traveling outside of Beirut, Lebanon, Darling was killed in an automobile accident. The Lebanese government erected a monument at the site of the accident to the memory of Dr. Darling and two other members of the commission who were also killed.

Although he considered himself a pathologist and is best known for his discovery of histoplasmosis, Darling is looked upon primarily as a medical zoologist. During a relatively short medical life span of 20 years, interrupted by prolonged and disabling illness, he managed to publish 103 articles and made significant original contributions to the field of medical parasitology, especially about malaria and hookworm disease.

Two decades after Darling's original report, the first case of histoplasmosis in America was observed in Minnesota. However, his well-known prophecy did not actually come true until 1938 when Hactel and Wright diagnosed the disease in a tavern keeper from Baltimore County, who was admitted to St. Joseph Hospital and died of disseminated disease. The diagnosis was established post-mortem by isolation of the fungus from a lymph node and blood.

First Epidemic

In 1949, one of the first epidemics of acute pulmonary histoplasmosis recognized in this country was studied at the University Hospital by Woodward. A farm family from Taneytown, Maryland contracted an acute pulmonary infection while cleaning manure out of their barn. The fungus was repeatedly cultured from specimens collected in and about the barn.

All of those infected by this epidemic recovered and their chest X-rays eventually showed numerous

calcifications. During World War II, many healthy, normal young men and women were rejected for service in the armed forces because these calcifications were thought to be evidence of healed miliary tuberculosis.

Prior to this, as pointed out by Comstock in a recent editorial, the association of histoplasmosis with pulmonary calcifications may well have had its beginning at the Hagerstown Tuberculosis Conference. In 1938, leading authorities in the field of tuberculosis met for a week in Hagerstown and discussed discrepancies in tuberculin testing and pulmonary calcifications. Tests in Williamson County, Tennessee, and Washington County, Maryland had established the fact that pulmonary calcifications were frequently found among persons who did not react to tuberculin. Palmer, a member of the conference, later showed by extensive skin testing surveys on student nurses, that infection with *Histoplasma capsulatum* was the most common cause of pulmonary calcifications in the United States.

Skin Tests

The use of the histoplasmin skin test has contributed much knowledge about the occurrence of the disease. Christie, in 1945, tested 181 children in an orphanage outside of Nashville and found 133, or 74%, to be positive to histoplasmin. He was the first to show that the disease frequently existed as a mild, asymptomatic infection and later caused the development of pulmonary calcifications in negative tuberculin reactors. Shortly thereafter, Palmer, as already mentioned, tested 10,000 student nurses and was able to map out the geographic distribution of histoplasmosis in the U. S. However, only 502 of those nurses tested were from Maryland and 31% were positive reactors. The number of nurses tested from Virginia and the District of Columbia was not given. At the same time, Emmons and his co-workers studied a rural community in Loudon County, Virginia, which is just across the Potomac River, and found that 83% of 476 residents had a positive histoplasmin skin reaction.

No other large scale skin test surveys were done in this area until 1957 when Edwards, Peeples, and Burger tested a group of high school students in Montgomery County, Maryland. The prevalence of histoplasmin sensitivity varied from 14% to 63% depending upon the location of the schools within the county. Seventy percent of life-time residents in the rural northwestern section bordering Frederick County were found to be positive. These data suggested that a study of adjacent Frederick County might be informative and, in the spring of 1961, second and sixth grade students of all the elementary schools in Frederick County were tested with histoplasmin. Of 1,924 students tested, 35% were found to be positive. Twenty-six percent of the second grade students and 42% of the sixth graders were positive. These data compare closely with those of Baybutt who carried out similar studies on 3,801 school children in Talbot County on the eastern shore. Thirty-nine percent were found to react to the antigen and, as expected, the percentage increased as the age of the student rose. Twenty-two percent of the first graders were positive and there was a gradual rise to 60% in the 12th grade students. Our studies in Maryland compare with those done in the well known, highly endemic areas bordering the Ohio and Mississippi river valleys. The studies done in Loudon County, Virginia compare closely with those done in Tennessee, while the results of the surveys done in Maryland are the same as those obtained in Ohio and Missouri. Thus, we feel that data has been accumulated to indicate that the Middle Atlantic states east of the Appalachians are highly endemic for histoplasmosis.

A more convenient skin test, the Tine histoplasmin test, is now available. It has many advantages over the usual Mantoux intracutaneous test, but a recent study comparing the two tests in Frederick County shows that the Tine test may fail to recognize a significantly large percent of those subjects who react positively to the histoplasmin Mantoux test. The results of a study that was done on 1,341 persons who were either patients at the Frederick Memorial Hospital or employees at Fort Detrick showed that 28% of those who were positive to the Mantoux failed to react to the Tine test. Approximately 4% gave a false positive result, that is, the Mantoux was negative, but the Tine was found to be positive. A recent report of the AMA by Froman gave more encouraging results but there was still a lack of agreement in 10.3% of those who were positive to the Mantoux and yet negative for the Tine test. The antigen impregnated on the four small prongs of the Tine test unit is relatively crude. The test would be more accurate if a refined antigen was used. There have been recent reports on studies designed to isolate the specific antigen that is related to histoplasmin sensitivity. Isolation of such an antigen has apparently been accomplished and there are indications that new and more precise tests will soon be available.

The fungus is bimorphic, that is, there is a yeast or parasitic phase seen in animals and a filamentous or saprophytic phase present in soil. Darling observed the parasitic or yeast form being engulfed by histocytes or monocytes and invading the reticuloendothelial system. He incorrectly surmised that the organism was a plasmodium. But in 1912, a Brazilian pathologist, DaRocha Lima, while studying Darling's original slides, correctly identified the organism as a fungus by comparing it to cryptococcus. Three decades later, DeMonbreun, a pathologist at the Nashville General Hospital, was able to artificially culture Histoplasma from a fatal case that had been diagnosed for the first time ante mortem.

Christie used a crude extract of DeMonbreun's culture in his first skin test survey in the orphanage.

Shortly thereafter, Chester Emmons, MD, of the National Institutes of Health, while searching for the fungus in man and animals both in Virginia and nearby Maryland, first showed that rats and mice could be naturally infected with the disease. Because of important public health implications, he began to test soil samples obtained in and about rat burrows. From December 1946 to December 1948, 387 soil samples from various farm sites in Loudon County, Virginia were cultured and, finally, two were found to be positive for Histoplasma. The two positive specimens were collected from a mound of earth at the entrance of a rat burrow which happened to be beneath a chicken house. At the time, he was unaware of the association of bird droppings with the presence of the fungus in soil. He was able not only to isolate H. capsulatum by culture but demonstrated the tuberculate spores in the soil, when examined directly under the microscope.

Isolating the Organism

It was not until 1957 that the true incidence of the disease in this area was appreciated. Emmons and Campbell collected over 50 proven cases of histoplasmosis that had occurred in Maryland, Virginia, and the District of Columbia and were able to isolate the organism from 22 premises in this area. In the fall of 1960, Emmons isolated the fungus from ten of ten specimens of soil collected in a small park in downtown Washington. This area was directly across from a large department store. On a windy day, many people were surely exposed to the park dust. Emmons was also able to collect positive soil specimens from another downtown Washington park, adjacent to the busy Union Train Station.

We have cultured the organism from a site in the Middletown Valley where a farmer contracted the disease while cleaning out an old abandoned silo. Attempts to find the fungus in various parks throughout the city of Frederick have been unsuccessful. Several years ago, after it was found that the fungus existed in downtown Washington, an attempt was made to isolate the organism in several large cities along the eastern seaboard. During this survey, Dr. Emmons and I collected specimens from various parks in Baltimore where it was known that starlings and grackles frequently roosted. Specimens were also collected from several downtown buildings and from the parks in Mt. Vernon Place. Over 100 specimens were taken but none were positive.

It is well known that the fungus is associated with the droppings of various birds, but the birds are not infected by the fungus and do not harbor the organism. A bird's temperature averages 105 F and this environment is probably incompatible with the growth of the fungus. However, it thrives in soil that has been mixed with bird droppings. Recently, the bat has been suspected as a possible vector in the spread of the disease. Being a mammal, its body temperature allows it to harbor the fungus. Since the original report in 1962 when the fungus was isolated from a bat captured in Panama, there have been numerous articles supporting the concept that the bat is closely associated with the peculiar micro distribution of the fungus in endemic areas. However, data from a recent report from Florida does not support this concept. Histoplasmosis is practically nonexistent in that state and there is a high incidence of the disease in bats that infest numerous caves in the north-central section.

The fungus has been isolated from feather pillows and this could conceivably be a source of infection in infants who have not been exposed to dust or soil contaminated by bird droppings.

Inhalation of spores or mycelial fragments usually causes a mild, benign and transient pulmonary infection which is rarely recognized and the diagnosis is usually made in retrospect. If the number of spores inhaled is large, an acute pneumonitis develops. Frequently, a diagnosis of viral pneumonia is made. Rarely in children and even more rarely in adults, the infection becomes widely disseminated with extensive invasion of the reticuloendothelial system. Frequently this type is seen in patients with a debilitating disease such as leukemia or lymphoma and in persons on large doses of steroids or other immunosuppressive therapy. A small number of primary pulmonary infections may progress into a chronic, cavitary type that is difficult to distinguish from pulmonary tuberculosis.

When the fungus is widely disseminated, various complications may develop and present as the major clinical picture, such as Addison's disease, acute pericarditis, meningitis, or endocarditis. Active disseminated disease and chronic pulmonary infection both require specific treatment or they are invariably fatal. Solitary or multiple ulcerations may occur in the oropharynx and in various parts of the intestinal tract. The iliocecal area is a favorite site and, at times, the granulomatous lesions are mistaken for carcinoma. A recent case observed here illustrates the point that a chronic anorectal fistula with recurrent abscess may rarely be due to histoplasmosis.

Here in Frederick County, a study is being conducted to correlate histoplasmosis with a peculiar form of chronic peripheral uveitis. The association of the condition with this particular fungus infection has been presumed, but not established, and it is hoped that the results of this excellent survey will give some of the answers to an unsettled and important problem.

Diagnosis

A high index of suspicion is vital in making a

diagnosis of this disease. A history of exposure to dust is a clue that usually requires detailed questioning by the physician. At times it is obvious, such as a recent cleaning of a chicken house or an abandoned silo, or a visit to a cave. But many times there is no known exposure to dust that may contain the spores of the fungus.

Physical examination is not helpful unless one finds a suggestive sign such as erythema nodosum or an unusual mucous membrane lesion which, on smear, biopsy, or culture may help to establish the diagnosis.

Chest X-rays are nonspecific—there are no pathognomonic signs. In acute, severe pulmonary infections there may be a miliary or diffuse nodular infiltration that resembles a typical pneumonia. Occasionally the patient looks well, has a mild cough, but may have extensive X-ray signs.

An attempt to culture the fungus in an acute pulmonary infection is rarely successful. However, when disseminated or chronic infection is suspected, an aggressive approach is indicated. Sputum is frequently cultured, but only in the chronic cavitary type is it found with any consistency. As in tuberculosis, bronchial washings and gastric washings should be obtained if necessary. Urine, stool, bone marrow, and blood are frequently productive sources for culture of the fungus. The marrow may be examined directly by routine as well as special stains. Scalene nodes and liver biopsy are other accessible sources of material for direct examination and culture. As mentioned, one should not overlook the opportunity to take a smear or scraping from a suspicious mucous membrane lesion. By using a Wright or Giemsa stain, the organism may be found.

Occasionally, the yeast phase in tissues is easily demonstrated on routine H & E stains but usually special silver stains are necessary. A control or known positive biopsy should be run simultaneously with each specimen, as these special stains require very precise technique.

H. capsulatum is probably the most difficult of the systemic fungi to grow. Growth takes longer and the fungus is most fastidious. Early subculture of suspicious colonies should be done frequently in order to avoid overgrowth by contaminants.

Culture of soil collected from a possible source of infection, many times, is helpful in confirming the diagnosis. This is a time-consuming procedure requiring about five weeks. The white mouse is exquisitely sensitive to the fungus and is used to isolate it from soil, as well as from clinical material. Ajello has shown that only one tuberculate spore is necessary to cause an infection in the albino mouse.

The type of media used is not as important as is an interested and experienced microbiologist who will take the necessary care to collect and prepare the specimens properly.

Serologic tests for histoplasmosis have many shortcomings and they are due, in part, to the crudeness of the antigens. Also, antibody response to acute fungus infections is generally slower than it is in bacterial infections and demonstration of the antigen is not as precise. Apparently, patients suffering from histoplasmosis may be immunologically responsive to all the antigens, to some of them, or to none. A lack of response does not exclude the diagnosis, especially when only a single specimen has been tested and when the clinical picture strongly suggests the disease.

Tests

Of the various tests available, the latex fixation and complement fixation tests are used most widely.

The latex fixation test is readily available in most laboratories and is easily performed. It becomes positive early in the course of an acute infection—as early as the 10th to 14th day after exposure. This is usually the time it takes for clinical symptoms to become manifest. In mild, primary cases, it is usually positive, but since the agglutinins or precipitins are transitory, the test is seldom positive in chronic, slowly progressive cases. False positive reactions detract somewhat from the utility of commercially available latex tests.

The complement fixation of CF test should be performed in conjunction with the latex fixation test. CF antibody response is usually observed after the 14th day in the course of the disease and elevated titres persist for several additional weeks or months. Then, in self-limited infections, rapidly decrease to residual levels of 1:8 or 1:16. These residual levels may remain unchanged for from three to five years or may become negative in as little as six months.

Both antigens, namely histoplasmin and the whole yeast phase antigen, should be used in the CF test to provide maximal diagnostic coverage. Serums from culturally confirmed cases of histoplasmosis may react to only one of these antigens. The whole yeast antigen is usually more reactive in acute cases while the histoplasmin titre rises in chronic, residual lesions with cavitation or fibrosis. In following a patient, persistent elevation of the histoplasmin antigen should alert one to the possibility of chronic infection.

Serologic tests have no diagnostic value in patients with a single pulmonary nodule that requires differentiation from carcinoma. It is highly presumptuous to establish a diagnosis of active histoplasmosis on CF titres of less than 1:32.

The histoplasmin skin test should be used with discrimination or not at all on persons who are subsequently to be serologically tested to establish the diagnosis of acute histoplasmosis. As with the tuberculin, it is frequently negative during the early acute phase and, if used in previous histoplasmin-positive patients, it will confuse the interpretation of

serologie titres. In patients who were previously negative to this antigen, stimulation by histoplasmin will not raise the titre signifieantly but, in a patient who has already been sensitized, there may be a rise in the CF titre to as high as 1:256 and the results of paired sera are misleading. One should always draw paired sera speeimens at least a week or two apart before applying the skin test.

Cross-reactions with blastomycosis and coccidiomyeosis are frequent and many times, in the initial sera specimen, the titre for the blastomyees antigen is higher than the histoplasmin or yeast phase antigen for histoplasmosis. This is usually elarified by paired sera as the titre of the eross-reacting antigen (in this ease blastomyces) falls, while there is a significant rise in the titre of the offending fungus (histoplasma). Coccidiomycosis is usually no problem as the cross-reaeting titre is usually lower and remains low. The titre of the blastomyces antigen is higher than either of the antigens for histoplasmosis in the initial specimen. As eaeh specimen is obtained, there is a fall in the cross-reacting antigen and a gradual rise in the titre of the antigens of the fungus that is the cause of the disease.

Treatment

Preventive treatment is of value and ineludes the use of masks or other proteetive apparatus when exposure to known hazardous dust is unavoidable. Before cleaning chieken houses, old atties, or abandoned silos, one should wet down the area while wearing a mask. A known area eontaminated by the fungus can be treated with 3% formalin as was done in Mason City, Iowa where, before treatment, 65% of soil specimens were positive for the fungus and one year after treatment, all specimens were negative.

The majority of patients with histoplasmosis require only symptomatic and supportive therapy, ineluding the majority of those with severe, aeute pulmonary disease. However, disseminated or chronie infections need speeifie treatment. We have seen severe, acute, bilateral pulmonary involvement reeover eompletely without specifie therapy. Whereas recently, a patient with diffuse miliary infiltration went on to develop widely disseminated disease several months after it appeared that the lungs had eleared almost entirely.

Sulfa therapy is effective against the organism both in vitro and in experimental animals. Christie uses triple sulfa in children with serious disease. In South America, Negroni reports that it is 50% effeetive when used in the treatment of the disease. However, most authorities who treat significant numbers of patients with deep mycotic infections report poor results with sulfa therapy.

A recent, careful cooperative study by the Veterans Administration and armed forees hospitals showed that a eombination of sulfa and amphotericin B was no more effeetive than amphoteriein alone in the treatment of ehronie eavitary histoplasmosis.

Amphotericin B, the first really effective broad spectrum antifungal agent for the treatment of systemie myeosis, was isolated in 1955 by Gold from Streptomyees nodosum recovered from a soil sample taken along the Orinoco River in Venezuela. Streptomycin and nystatin were originally isolated from other strains of Streptomyees.

Marketed under the trade name of *Fungizone*, the antibiotie is fungistatie and not fungieidal at elinically obtainable concentrations. It is effective only when given intravenously or intratheeally as it is poorly absorbed from the GI tract or from intramuscular sites.

Unpleasant side effeets invariably develop with its use but there is a wide individual variation as to the degree and frequeney of these reaetions. Chills, fever, nausea, vomiting, and anorexia occur to some degree in most patients. The severity of side effeets ean be modified by giving a small dose of steroids prior to the four- to six-hour infusion.

Although only a small amount of the drug is exereted through the kidney (roughly 5%), it causes serious renal toxieity—mainly reversible. But permanent parenehymal damage is frequently demonstrated by renal biopsy or at autopsy. Regular determinations of serum urea nitrogen and ereatinine are mandatory. Anemia and hypokalemia are frequent eomplications but they disappear after therapy.

Since the drug is used so infrequently in the average, general hospital, details of dosage need not be given but when one embarks on a course of treatment with this drug, he must be prepared for a long and arduous task, both on the part of the patient and the physician. The usual course of treatment for disseminated or cavitary pulmonary histoplasmosis is three months and relapse occasionally oceurs which requires treatment.

Bennett, at the NIH, has reeently shown that double dose alternate day therapy gives blood levels which are as good as those obtained with daily treatment. This halves the number of infusions, the time spent by both physieian and patient, the ineidence of thrombophlebitis of arm veins, and the occurrence of side effects.

Summary

The ineidence of histoplasmosis is as high in this area as in the midwest.

Many early historieal events assoeiated with the disease have taken plaee in Maryland and nearby Virginia. Since the diagnosis of the disease still depends on a high index of suspicion, it is appropriate, even after 63 years, to quote Darling's prophecy recorded in the Alumni Bulletin of the School of Physicians and Surgeons—"The disease is bound to appear in Baltimore some day. I hope it does not catch you napping."

Salmonella and shigella infections have presented the greatest problem in communicable diseases in Frederick County in the past three years. While no deaths have occurred, these diseases have been a major cause of illness.

Shigella and Salmonella Infections in Frederick County

CHARLES G. SPICKNALL, MD, FACP
Deputy State Health Officer
Department of Medicine
Frederick Memorial Hospital

Two cases of typhoid fever have been reported in the city of Frederick during the past three years. One patient was a 66-year-old woman whose 74-year-old husband gave a history of typhoid fever many years before. Multiple cultures of the husband's stools showed typhoid organisms. There were many cross connections in the plumbing of the old house where the couple lived. No other cases of typhoid occurred in this area of the city.

The second case was a 13-year-old boy and occurred almost one year after the first. Extensive epidemiological investigation failed to reveal the source of his illness, but cross connections were also found in the house where he lived, which was in a different section of the city from that of the couple in the first case.

Both plumbing violations were corrected.

It is interesting to note that both patients were residents of the city of Frederick, which has a municipal water and sewerage system.

The treatment of the 74-year-old typhoid carrier was discussed with his physician. Because of the patient's age and cardiac disease, it was decided that no attempt should be made to eradicate the carrier state. In a recent study of the treatment of 60 typhoid carriers by Dinbar and his associates, it was found that ampicillin offered a good chance of success in patients without biliary disease if large doses and prolonged therapy are used. In biliary carriers with stones, the combined surgical-antibiotic method of treatment gave much better results than either therapeutic measures.

The U. S. Public Health Service has recently changed its recommendations for typhoid vaccine for overseas travel. The vaccine is no longer recommended if the traveler stays in the usual "tourist accommodations".

Causes of Salmonella

Most of the salmonella infections, other than typhoid fever, have occurred as sporadic infections for which no cause could be found. Two major outbreaks have occurred. In one outbreak, over 100 students and faculty members in a college became ill with gastroenteritis probably as the result of eating contaminated ship-rounds of beef. At the time of investigation, there was none of the beef available for examination. Salmonella St. Paul was isolated from the stools of four patients.

Three of eleven persons who lived in a rural house that had been converted to a three apartment building became ill. Salmonella typhimurium was isolated from the stools of these patients. The water supply came from a spring which was found to be heavily contaminated. Chlorination of the water supply eliminated the contamination and no further infections occurred.

The sources of salmonella infections are food, water, domestic animals (dogs particularly, and cats to a lesser extent), fowl, and turtles.

Chronic carriers of salmonella organisms other than typhoid are rare. Antibiotics have been found to prolong the excretion of salmonella and the clinical value of antibiotics in amelioration of symptoms of uncomplicated, Salmonella gastroenteritis is questionable. Antibiotics also favor the development of resistant strains, making these infections potentially more dangerous.

Shigella Incidence

The incidence of shigella as compared to salmonella infections has been interesting and puzzling. Table I shows that for each year since 1965, the number of salmonella cases has not varied very much. For the three years 1967 to 1969, however, the incidence of shigella infections was much greater than in 1966 and 1970. It is also interesting to note that all the cases of bacillary dysentery were caused by *Shigella sonnei*. In 1969, a waterborne outbreak of shigella dysentery accounted for some of the cases.

Table 1: Shigella and Salmonella Infections Frederick County 1966-1970

	Shigella	Salmonella
1966	**1**	**16**
1967	**16**	**8**
1968	**23**	**15**
1969	**38**	**13**
1970 (to October 1)	**2**	**11**

Between December 12, 1968 and January 12, 1969, 21 cases of *Shigella sonnei* occurred. There was no increased incidence of these infections in the rest of the state. An epidemiologic study of these cases demonstrated no common source, although there was evidence of transmission of the organism from one family member to another in different families.

In May and June, 1969, 54 of 114 residents in 26 dwellings of a housing development developed febrile gastroenteritis. *Shigella sonnei* was isolated from 9 of 17 patients in four households. Except for a common water supply, no factors could be found to account for the outbreak. The developer had not installed a chlorinator for the water supply even though he had been informed by letter he was required to do so. The plans he had submitted and which were approved by the Health Department included a chlorinator. The outbreak ceased promptly after a chlorinator was installed (as indicated in Figure 1).

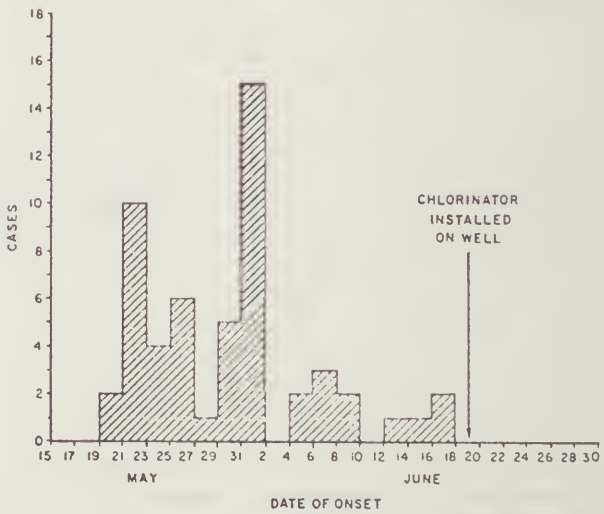

Figure 1: Febrile Gastroenteritis by Date of Onset in Frederick County, Maryland, May 15-June 30, 1969.

Most of the shigella infections in the United States in recent years have been caused by *Shigella sonnei* or *flexneri*. Infection with *Shigella dysenteriae* or *boydii* is rare in the United States and suggests foreign acquisition of the disease.

In the United States, shigellosis occurs principally in mental institutions, on Indian reservations, and in lower economic groups. Shigella infections are transmitted by food or water, flies, direct contact, and objects soiled with feces.

Ampicillin is the drug of choice in the treatment of shigellosis and a tetracycline is an alternative drug. Antibiotic therapy may not be essential in most cases since the disease is usually mild and self-limited.

Both salmonella and shigella infections continue to be Frederick County's major health problems. Both are puzzling and interesting diseases. Perhaps time and study will help us to eradicate them.

Q Fever

RUSSELL L. GUEST, MD
Department of Pediatrics
Frederick Memorial Hospital

A review of the cases of rickettsial disease experienced at the Frederick Memorial Hospital during the period of 1959 to 1969 was performed recently. The case records indicated that Rocky Mountain spotted fever was diagnosed in 13 cases and recovery was achieved in 12 of them. One patient died.

This experience demonstrated that no other rickettsial disease of man was diagnosed during that period. This negative finding seems quite unusual. Frederick County is a farm area in which milk production and cattle raising are dominant features of the economy. In the Milwaukee, Wisconsin milkshed, 73% of the cattle are infected with Q fever, though only 3.4% of humans in the area have complement fixation antibodies. Apparently, skin testing is more sensitive, since 98% of dairy workers react.

In September 1969, the *New York Times* carried an article on biological weapons. It pointed out that potential agents for biological warfare are chosen from four kinds of microorganisms: bacterial diseases, such as plague and anthrax; viral diseases, such as yellow fever and encephalitis; anticrop fungal disease such as rice blast and potato blight; and rickettsial disease such as Q fever and Rocky Mountain spotted fever.

Fort Detrick, in Frederick, Maryland, is America's center for research and development of biological warfare agents. Detrick personnel have played a key role in developing at least four strains of known disease for military use. These diseases are anthrax, tularemia, psittacosis, and Q fever.

A close look at Q fever might provide a valuable

resource for physicians practicing in this geographic area.

For many years, Q fever was classified in the genus *Rickettsia.* About 25 years ago, a separate genus, *Coxiella,* was created for Q fever, since it presented so many differences from the genus *Rickettsia*: ie, it is filterable, very resistant to physical and chemical agents; it does not evoke agglutinins against Proteus X strains; it does not produce a cutaneous rash; it does not elicit a "toxic" reaction in experimental animals; it is not inhibited by the antibiotic thiocymetin; and it does not require an arthropod vector to maintain itself successfully in nature.

Recognizing Q Fever

Historically, Q fever was first recognized as an entity in Brisbane, Australia about 35 years ago. Slaughterhouse workers manifesting a febrile illness of epidemic proportion were found to have the offending microorganism in their blood and urine.

An obligate, intracellular, parasitic microorganism, C. burneti produces in humans an acute systemic illness. Ushered in with sudden onset, it is accompanied by malaise, chills, fever, myalgia, and most characteristically, severe headache.

C. burneti was found to occur in almost all domestic and wild animals, birds, insects, flies, ticks, lice and mites. Domestic cattle, sheep and goats have been incriminated as the reservoir of human Q fever. Curiously, in these animals reservoirs, the infection is not apparent. Apparently healthy animals shed enormous numbers of coxiella in the milk, urine, feces, and placenta.

Cases of Q fever have been traced to contaminated clothing, to dusty straw, and to soil contaminated with animal droppings. The available evidence suggests that the organisms gain entry to the human through the conjunctivae, by the ingestion of raw milk or, in the majority of cases, by inhalation.

Q Fever Epidemics

Two properties possessed by C. burneti are of importance in the establishing of Q fever epidemics. The first factor is the extreme resistance of the organism to the hardships of the environment. This enables the organism to endure for months on objects such as clothing, farm implements, trucks, or simply in the dirt and dust of the countryside. The second factor is the small size of the infectious dose. The infectious dose for man is one organism and with larger doses, each organism acts independently in the initiation of infection.

When first recognized as an entity, Q fever was little suspected of being capable of causing an epidemic or having a world-wide distribution. Time proved otherwise. World War II set the stage for epidemics of generous proportions in German occupation troops in Italy, the Ukraine, the Crimea, Bulgaria, and Greece. British troops experienced outbreaks of the disease in Greece and Italy.

In the United States, outbreaks have occurred in Southern California, Texas, and Chicago.

Since World War II, epidemics have been recognized in Italy, Germany, Switzerland, USSR, the Balkans: some 51 countries on five continents. When the disease breaks out, the epidemics are quite large. For example, in the California epidemic, more than 50,000 people were found to be infected.

Following an incubation period of 18 to 21 days. the disease manifests with high fever, chills, severe frontal headache, general malaise, anorexia, and myalgia. Severe retro-orbital or eye pain is a common complaint. Patients manifest a relative bradycardia, hepatomegaly, splenomegaly, and pneumonia. There is suprisingly little in the way of physical findings on examination of the chest. The disease is rarely fatal, and complications are rare. The disease may assume a chronic form in persons over 40 years of age. In contrast to rickettsial disease, hepatitis and subacute endocarditis are encountered in Q fever.

The disease should be suspected in any patient who has been in direct or indirect contact with livestock. The diagnosis may be established in isolation of the organism from the blood or by a significant rise in specific antibodies. Serologic methods are the procedures of choice. Agglutinins tests appear more sensitive than complement fixation tests. Agglutinins appear early in the illness and are demonstrable in about 50% of patients within the first week. The percentage of positives rises to 100% within four weeks after onset. In contrast, complement fixation antibody is encountered only rarely during the first week of illness, but rises to about 90% by the end of the fourth week.

Treatment

The tetracycline group of drugs has been found to be effective in relieving the disease symptoms if administered in the first three or four days of the illness. Chloramphenicol is not as successful as the tetracyclines. These drugs are not as effective in the treatment of Q fever as they are in the treatment of rickettsial diseases.

Person-to-person infection with C. burneti has been reported, but appears to be an unusual occurrence.

Vaccines against Q fever have been prepared and appear to offer protection. A high incidence of local reaction to the vaccine diminishes its usefulness. Vaccination of high risk individuals might be a profitable pursuit. The vaccination of cattle does not appear economically feasible.

Located as we are in Frederick, knowledge of this disorder may clarify an otherwise puzzling clinical problem.

The biology of the lymphocyte has become one of the most exciting stories in contemporary medicine. For most of us, having been out of medical school for some years, the small lymphocyte is a cell in the "white cell" series, about which we were taught little. From differential white cell counts we recognized that the lymphocyte accounted for between one fourth to one third of the normal adult white cell differential count. We were aware that this cell type was seen frequently in association with chronic processes in tissue sections.

THE LYMPHOCYTE

ROBERT J. FURIE, MD
Department of Pathology
Frederick Memorial Hospital

We were also always aware that the lymphocyte was a cellular component of blood, the major cell type of the lymph nodes, spleen, and Peyer's patches; and was distributed diffusely throughout the bone marrow and intestinal mucosa. The cell was described as about eight micra in diameter, endowed

with very little cytoplasm, devoid of an apparatus for protein synthesis, and neither phagocytic nor chemotactic. It was also said to lack the mechanism and ability for cell division. Not a very strong list of attributes, it would seem.

The Lymphocyte and Immunity

The lymphocyte, we now learn, is virtually linked to immunity.

Immunity is an everyday word, ordinarily applied to the elaborate set of responses by which the body defends itself against invading microorganisms or foreign tissues. Antibody production in response to antigen stimulus has been known since the late 19th century. The production of immunity is classically considered to be the synthesis of gamma globulin antibodies, capable of uniting with antigens, to render them noninjurious either by precipitation or by some other means of inactivation.

However, it is now appreciated that this description is an oversimplification. Immunity comprises more than the formation of circulating (humoral) gamma globulin antibodies.

Three patterns of immunity are recognized: (1) the production of circulating gamma globulin antibodies which result in immediate immune reactions; (2) poorly understood antibodies as seen in hay fever; and (3) cell-based immunity or sensitivity known as delayed immunity responsible for such reactions as the tuberculin reaction.

The involvement of the small lymphocyte in these immune processes is a fascinating story. Once felt to be a homogeneous cell population, lymphocytes are now known to be anatomically and functionally heterogenous. These undistinguished cells actually represent cells which look alike but have a different heritage and destiny.

The cell type involved in the immune reaction is the lymphocyte. The manner in which this is achieved is better understood through a review of what happens when a small lymphocyte is challenged. This small lymphocyte, which lacked the power to divide and which was manifestly inert, springs to life. These small cells enlarge and begin to exhibit reticular chromatin. Prominent nucleoli then appear and large amounts of intensely basophilic vacuolated cytoplasm is evident. These enlarged, transformed cells replicate their DNA and go on to mitosis. These "transformed" lymphocytes may change into the morphology of a plasma cell which produces circulating (humoral) antibody; or they may mature into the small lymphocyte characteristic of the cell type seen in delayed hypersensitivity, the fixed type of tissue reaction of which the tuberculin reaction is prototype.

Not all lymphocytes are capable of displaying the tissue type of immune reaction. Those lymphocytes which are competent to perform this function are thought to be derived from the thymus gland. Those lymphocytes which transform into globulin-producing plasma cells (which manufacture circulating antibodies) are derived from other central lymphoid organs such as the intestinal lymph nodes of man.

The Transformation of Lymphocytes

There are several "triggers" for the transformation of lymphocytes just described. They transform (1) when they meet an antigen to which they have been previously exposed and sensitized; (2) when they encounter tissues from another individual with whom they are not tissue compatible; (3) when these lymphocytes are treated with various antisera produced against their surface constituents; and (4) when they are exposed to certain nonspecific agents such as bacterial toxins, phytohemagglutinins, etc.

After each stimulus, these small, dormant lymphocytes are capable of arousing an inflammatory response in the tissues in which they are located, and to which they have been previously indifferent. From mechanisms within the cells, which are triggered by the encounters with the stimuli, these transformed lymphocytes release substances into the surrounding medium which may have a number of effects.

These effects may be to: (1) kill previously intact sister cells; (2) inhibit the migration of macrophages; (3) call forth other leucocytes; (4) cause vascular permeability; and (5) transfer to other previously inert lymphocytes the capacity to become similarly transformed after further encounter with suitable antigens.

Such transformed cells are, therefore, fully equipped to do battle with unwelcomed cells when they are introduced by the transplantation surgeon, or are the result of somatic mutation as in the case of cancer cells, or are recognized as foreign because of damage inflicted by acute inflammation. In the process, this system—apparently designed for surveillance and elimination of undesired pathogens or cells—can also produce factors which injure normal cells in the vicinity of the conflict.

After the need for the transformed lymphocytes has terminated, it would be ideal if some regulatory mechanism would stop the proliferation and activity of these lymphocytes. In those cases where this "shut-off" mechanism does not operate effectively, chronic inflammatory processes ensue, which might be typified by rheumatoid arthritis, graft rejection, and autoimmunity. It is of some interest that those agents (such as cortisone, chloroquine, and some immunosuppressive drugs) which inhibit the response of normal lymphocytes to "transforming" agents not only suppress delayed hypersensitivity but inhibit the mechanisms of surveillance and rejection.

Obviously, this is but the beginning. Much more will be learned about this cell type—the lymphocyte.

Postoperative Wound Infections

ROBERT J. THOMAS, MD
Department of Surgery
Frederick Memorial Hospital

In the history of surgery, a major period of significant advance took place when an understanding of the role of bacteria in wound infections led to remedial practices. This period of success was achieved by the employment of strict practices aimed at reducing the opportunity for infection, from within or from without.

It might be said that this era of surgical success, in large part due to the control of postoperative infection, continued until the days of the introduction of antibiotics. Overconfident of the effectiveness of antibiotics, surgeons became more and more careless in the practice of the simple principles upon which a generation of surgical success had been built.

Aseptic technique, a time-proven method, was abridged. The preparation of the patient, the cleansing of the operative area, the details which had made success possible in the past, were abridged, bypassed, and ignored. The use of adequate masks was disparaged. Reliance on "cold" solutions for sterilization was introduced in preference to steam autoclaving. Cross-contamination of dressing carts and wounds was tolerated. Wounds were exposed to the air without appropriate dressings. Surgeons, nurses, and technicians were reluctant to scrub their hands and forearms adequately. Punctured gloves were not changed.

The rise of antibiotic "prophylaxis" led to a sense of false security which, coupled with false reasoning, led to overconfidence. The very drugs the patient needed to receive in treatment of the postoperative infection were useless. The offending organisms had long since become resistant to those antibiotics. The hospital environment created resistant strains of microorganisms through the abusive employment of prophylactic antibiotics.

Truly, then, what are the facts? What information is valid for the adequate treatment of patients?

While the opportunities for postoperative infection to gain a foothold are many, it is the current consensus that several general, broad truths can be expressed.

Sources of Infection

Obviously, postoperative infections can arise from so-called exogenous sources, ie, the surgical team or operating personnel, the patient's skin and the equipment, instruments, and materials used in the operating room.

It is equally obvious that there may be endogenous sources of these postoperative infections, ie, skin, patient's upper or lower respiratory tract, gastrointestinal tract, regional lympathics, and the blood stream.

Extensive studies have been carried out in an attempt to identify the major problem sources of microorganisms in postoperative infection. While

just about every source can cause postoperative infection, the experience in the studies indicate that direct contact from either exogenous or endogenous sources tops the list. Environment air and endogenous bacteremic sites are not a frequent source. One fact stands out consistently—people seem to be the basis for most sources of contamination.

The message inherent in the conclusions of these studies is that people who follow careful, reasonable practices will prevent a great many postoperative infections.

Since the hospital expects bacterial contamination as a by-product of treating sepsis, every effort should be made to keep the contamination to a minimum through the practices of cleanliness, isolation, and design.

The operating room and its immediate environment must receive the most detailed attention to diminish the intensity of possible contamination. While it is inevitable that patients going to the operating room are grossly contaminated, every conceivable practice must be analyzed to reduce that level of contamination. Too often expediency is the guiding light with the price of postoperative sepsis the result.

Reducing Contamination

Methods of sterilization must receive conscious review and, where possible, sterilization by steam must be the method of choice.

Those responsible for making and enforcing the rules in a surgical department must recognize the validity of the concept that most postoperative infections result from contact contamination. Most of this problem revolves about people who comprise the surgical team who, either by contact or aerosol, infect the patient. Inadequate scrubbing, punctured gloves, and infections of the skin (apparent or inapparent) lead to the postoperative sepsis.

Aseptic technique must be established and maintained strictly in the operating room. No breaks in technique should be tolerated.

Persons who are known to have infections with staphylococci must be excluded from the operating room, the recovery room, and from the intensive care areas.

It goes without saying that all unnecessary persons must be excluded from the operating room. Persons not trained adequately in aseptic technique must not be allowed to work in the operating room.

A constant vigil must be maintained so that the instruments and supplies used in the operating room are effectively sterilized.

Materials that are particularly difficult to sterilize, such as ointments, powders, etc, must receive special and continued attention.

Worthy of special note are those instruments such as cystoscopes, resectoscopes, endoscopes, etc, which cannot be sterilized with steam. The methods available to render them sterile are so uncertain that a constant vigilance is needed to insure the efficiency of the methods.

All street clothes should be removed and operating-room attire put on before entering the operating room. Obviously, those surgeons who parade about the hospital in their "scrub" suits should be brought to account with admonition. They should be instructed to change clothes before re-entering the operating suite. No exceptions should be allowed. The wearing of proper masks, worn properly, should be routine and mandatory.

Team Effort Needed

All personnel involved in the surgical team effort should be required to scrub their hands and forearms preoperatively. Meticulous attention to this time-honored, reliable practice should be given with no deviation from established rules being permitted. Re-scrubbing between cases must be insisted upon. Punctured gloves must be changed immediately.

The operative area must be prepared and draped in acceptable fashion. The skin surface must be prepared properly, allowing the skilled person time for the procedure. Shaving should not be done in the operating room. Diligent scrubbing, liberal use of soap and water, and the chemical disinfection of the skin must receive as much deliberate and devoted attention as the washing of the surgeon's hands. The draping of the operative area should be done purposively, carefully, and expertly.

The patient may be a source of the contamination. This is particularly true in operations of the lung and gastrointestinal tract associated with the transection of a hollow viscus. Every effort should be made to isolate the contamination through surgical technique, rather than to rely on antibiotic therapy.

The stocking of the dressing cart and the changing of dressings afford a good opportunity for cross-infection unless measures are enforced to prevent their occurrence. No detail should be allowed to escape effective remedy.

The indiscriminate use of antibiotics has already been referred to on several occasions. The advice against such practice is founded on solid evidence. Similarly, the prophylactic use of antibiotics, except in rare and specific circumstances, has no merit and should be avoided.

Lastly, housekeeping is part of the team effort. No detail of design or dusting is unimportant. Not only the intent to reduce contamination must be wholesome: the methods employed must be completely reviewed for their efficiency.

There is no room for complacency. If postoperative infections are to be maintained at an acceptable minimum, everyone involved must play a conscious alert role.

It has been established that about 40% of patients with fever of unknown origin will eventually develop features which will permit a diagnosis to be made. About one half of these problem cases will recover without having had a diagnosis established. Ten percent of this group of patients will continue to be febrile, without a diagnosis being reached.

Exploratory Laparotomy in Fever of Unknown Origin

REX R. MARTIN, MD
Department of Medicine
Frederick Memorial Hospital

An analysis of the experience of others in the management of fever of obscure origin is a profitable, practical exercise. By study of their data, a productive course of action may be fabricated.

Yale Study

About 15 years ago, at Yale, 100 consecutive patients with the problem of fever of obscure etiology were studied. The following table shows the diagnostic categories into which the patients were grouped.

A. Infections—34

TBC—11
Liver and Biliary Tract—7
Endocarditis—5
Abdominal Abscess—4
Pyelonephritis—3
Brucellosis—1
GC Arthritis—1
Malaria—1
Cirrhosis with Bacteremia—1

B. Hypersensitivity States—4

Granulomatous Hepatitis—2
Erythema Multiforme—1
Drug Fever—1

C. Facitious Fever—3

D. Undiagnosed—7

E. New Growths—19

Carcinomatosis—7
Localized Tumor—2
Lymphoma, Leukemia—8
Unclassified—2

F. Collagen Disease—15

Rheumatic Fever—6
SLE—5
Cranial Arteritis—2
Unclassified—2

G. Miscellaneous Disease—16

Pulmonary Embolism—3
Benign Nonspecific Pericarditis—2
Sarcoidosis—2
Periodic Disease—5
Weber-Christian—1
Thyroiditis—1
Myelofibrosis—1
Ruptured Spleen—1

One third of these patients died. Of those who recovered, 38% were judged to have done so only because the exact diagnosis was made. Appropriate, specific therapy hinged on the correct diagnosis. This experience underlines the need to exhaust every reasonable means to establish the correct diagnosis in such patients.

An important point may be learned from an analysis of the autopsy diagnosis in this series of 100 patients.

Causes of FUO Discovered at Autopsy

Monocytic Leukemia—2
Miliary TBC—1
Liver Abscess—1
Subphrenic Abscess—1
Ascending Cholangitis—1
Bacterial Endocarditis—1
Multiple Pulmonary Emboli—1

The point to be gained is that serious infection may be most difficult to diagnose and thus delay treatment or result in improper treatment.

Frequently, in managing a patient with fever of obscure cause, there comes a time when, despite one's best diagnostic efforts, the etiology of the patient's fever remains obscure. At that point, a difficult decision must be made. Should the patient be treated

blindly? Or should the final step be taken—exploratory laparotomy? Since there are divergent opinions on the value of abdominal exploration in these cases, particularly in those instances in which there is little or no evidence pointing to intra-abdominal disease, a review of the experience of others has merit.

Mayo Clinic Report

A report from the Mayo Clinic, involving an analysis of 70 such patients, appears to be the largest series to date. In their groups, 30 of the 70 patients had no subjective or objective indication of intra-abdominal disease.

Mayo Clinic Experience

Malignant Disease	**21**
Specific Infection	**15**
Indeterminate Disease	**14**
Miscellaneous	**6**
Nothing Found	**14**
	70

From this tabulation, it is apparent that positive information was established in 80% of the cases. In only 20% was nothing found. A definite diagnosis was established in 60% of the cases. The morbidity and mortality due to the operative procedures were said to be negligible.

The Johns Hopkins Series

In the fall of 1969, a group at The Johns Hopkins Hospital reported a series of 28 patients with fever of unknown origin who were subjected to abdominal exploratory laparotomy. These patients were studied intensively for at least three weeks prior to operations. In all instances, the studies failed to establish a precise diagnosis.

Exploratory laparotomies were performed on 28 patients. As a result of the surgical procedure, the cause of the fever was established in 16 out of the 28 patients, or 57%. This tabulation further reveals that in all but one instance, the cause of the fever could be treated. And, in fact, the fever subsided with appropriate treatment.

Findings at Laparotomy

Malignant Disease—3
Infection—6
Collagen Vascular Disease—4
Sarcoid—2
Regional Enteritis—1

There were no postoperative deaths and no significant complications occurred as a result of the operations.

It is of some interest to pursue the causes of fever that were established later in those cases in which no diagnosis was possible at the time of abdominal exploration.

Subsequent Course of Negative Laparotomies

Diagnosis Never Established—7
Diagnosis Established—5
Brucellosis—1
Reticulum Cell Sarcoma—Knee—1
Stone—Common Bile Duct—1
Maxillary Sinusitis—1
Factitious Fever—1

Of 12 cases not diagnosed at laparotomy, seven remained undiagnosed, even after the passage of considerable time.

Exploratory laparotomy should not be performed until all other pertinent diagnostic studies have been completed. The diagnostic approach must include not only various laboratory, X-ray, and other special procedures but also, and above all else, a searching clinical observation during which the patient is thoughtfully requestioned and reexamined.

Fever of Unknown Origin

Fever alone is no cause for haste. The art of clinical management of fever of unknown origin is knowing when to terminate such observation. Against haste is the fact that some 20% of such patients eventually recover spontaneously without any specific treatment. And, we are all much too familiar with the sad experience of observing adverse clinical course following a surgical procedure. In general, the less objective clinical evidence there is of some intra-abdominal abnormality, the longer should be the period of observation. Physical and psychiatric strain on the patient must be considered. From the physical standpoint, the key question is whether any of the organ systems are being importantly affected in a deleterious manner. Clearly, progressive alterations call for immediate decisions.

At the time of operation, a midline incision is used. The liver should be biopsied whether it is manifestly diseased or not. All organs should be closely examined. If any abnormalities are found, the involved tissue should be removed for histologic examination. It is desirable to divide the specimen for histologic and microbiologic study.

In the diagnosis of fever of unknown origin, after a period of meticulous and unrewarding study and observation, an exploratory laparotomy should be considered. In cases where abdominal symptoms are present, exploratory laparotomy is likely to produce information of specific therapeutic value. When no evidence of intra-abdominal disease manifests, one should prolong the period of observation and search the abdomen only if there is progressive deterioration of the patient's status.

Fever of unknown origin continues to present a challenging problem to the clinician. When fever is the primary evidence of illness over a period of time exceeding three weeks, a sound approach to diagnosis is imperative.

MINUTES OF THE BUSINESS SESSION

Semiannual Session, House of Delegates
(270th Meeting)
Medical and Chirurgical Faculty of the State of Maryland
Friday, September 11, 1970
Hotel Hershey, Hershey, Pennsylvania

The 270th meeting of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was called to order at 9:40 AM, Friday, September 11, 1970, at the Hotel Hershey, Hershey, Pa., the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance: An asterisk indicates an alternate delegate.

Doctors: Manning W. Alden, Council; *Faye W. Allen, Anne Arundel County; Robert G. Angle, Montgomery County; Charles Bagley, III, Wicomico County; Timothy D. Baker, Baltimore City; George S. Banning, Jr., Prince George's County; Richard D. Bauer, Past President; Emidio A. Bianco, Baltimore County; M. McKendree Boyer, Past President; Henry A. Briele, Council; D. Delmas Caples, Baltimore County; Douglas G. Carroll, Baltimore City; Katharine A. Chapman, Montgomery County; John T. Chissell, Council; John N. Classen, Baltimore City; Archie R. Cohen, Washington County; Kenneth Cruze, Montgomery County; William B. Culwell, Carroll County; Richard Y. Dalrymple, Council; Worth B. Daniels, Jr., Baltimore City; H. Vincent Davis, Cecil County; Melvin B. Davis, Baltimore County; John B. De Hoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; John M. Dennis, Council; J. Sheldon Eastland, Past President; Wolcott L. Etienne, Council; George G. Finney, Jr., Baltimore City; Vincent J. Fiocco, Carroll County; Elliott R. Fishel, Baltimore City; Russell S. Fisher, Council; Gina M. Glick, Allegany; Robert B. Goldstein, Council; George H. Greenstein, Baltimore City; Paul F. Guerin, Council; *J. Roy Guyther, St. Mary's County; William B. Hagan, Council; Louis E. Harmon, Baltimore City; John C. Harvey, Council; Philip W. Heuman, Harford County; Claude D. Hill, Baltimore City; *Charles Earl Hill, Baltimore County; *John C. Hyle, Baltimore County; J. Parran Jarboe, Council; Ferd E. Kadan, Baltimore County; William H. Kammer, Baltimore County; Seruch T. Kimble, Council; *John M. Krager, Baltimore County; *Justinas Kudirka, Howard County; Henry P. Laughlin, Council; Herbert H. Leighton, Garrett County; Charles H. Ligon, Council; Elmer G. Linhardt, Board of Medical Examiners; Charles B. Marek, Baltimore City; Francis C. Mayle, Jr., Montgomery County; Karl F. Mech, Council; B. Martin Middleton, Council; Donald W. Mintzer, Baltimore City; Andrew C. Mitchell, Wicomico County; Marvin I. Mones, Montgomery County; Frederick E. Musser, Prince George's County; Chas. F. O'Donnell, Council; *J. Allan Offen, Montgomery County; Hilary T. O'Herlihy, Anne Arundel County; William A. Pillsbury, Council; *Frank E. Poole, Wicomico County; Thaddeus E. Prout, Baltimore City; *Belden R. Reap, Montgomery County; J. Morris Reese, Past President; Thomas Reid, Frederick County; Antonio M. Rivera, Anne Arundel County; Martin A. Robbins, Baltimore City; Donald J. Roop, Council; Edwin Ruzicka, Talbot County; Peter Santucci, Montgomery County; John F. Schaefer, Council; Emanuel A. Schimunek, Council; *John O. Sharrett, Baltimore City; Margaret L. Sherrard, Baltimore County; Arthur G. Siwinski, Council; Gordon M. Smith, Mont-

gomery County; *John R. Smith, Queen Anne's County; Roland T. Smoot, Baltimore City; Aaron C. Sollod, Baltimore City; William G. Speed, III, Council; George R. Spence, Montgomery County; Martin E. Strobel, Baltimore County; Robert J. Thomas, Council; Chris P. Tountas, Baltimore City; Francis J. Townsend, Jr., Worcester County; John B. Umhau, Montgomery County; *Baltasar B. Velez, Baltimore County; Thomas E. Van Metre, Jr., Baltimore City; Hugh W. Ward, Calvert County; Chas. E. Wright, Frederick County; *N. Louise Young, Baltimore City; Raymond M. Yow, Council.

Present also were staff personnel.

INVOCATION

Karl F. Mech, MD, Treasurer of the Faculty, delivered the invocation.

ANNOUNCEMENTS

The President made announcements dealing with the conduct of business at the session.

INTRODUCTION OF NEW MEMBERS

The President introduced the following new members of the House of Delegates:

Robert B. Goldstein, MD, Baltimore City (Council)
Charles H. Ligon, MD, Sandy Spring, Second Vice-President (Council)
Emanuel A. Schimunek, MD, Baltimore City, First Vice-President (Council)
Daniel I. Welliver, MD, Westminster, Third Vice-President (Council)

MINUTES OF ANNUAL SESSION

The minutes of the House of Delegates of the April 1, 1970 and April 3, 1970 sessions, having been distributed to all members and having been approved by the Executive Committee, were presented to the House for information.

EMERITUS MEMBERSHIP

On motion of the Council Chairman, the following members who had received the recommendation of their respective societies and the Council, were elected to Emeritus Membership in the Faculty:

Irene B. Barrett, MD, now of Littleton, Colo. (Montgomery County)
Robert B. Mitchell, MD, Baltimore City

REPORT OF THE COUNCIL

Dr. Alden, Council Chairman, presented the following report to the House of Delegates in connection with referral from the Annual Session. The report was received for information.

The Medicare Newsletter quoted at the House of Delegates Session on Friday, April 3, 1970, does not place an "arbitrary restriction" on the number of visits a physician may make on a patient, but reads as follows:

"Please be sure to include current medical diagnosis. Medicare regulations stipulate that payments be made only where there is clear medical necessity for the services being performed. As a general guide when requesting payments for visits in excess of four a month, be sure that the diagnosis given reflects the acute condition being treated."

1971 SEMIANNUAL HOUSE SESSION

Dr. Alden, Council Chairman, on behalf of the Council, offered a motion to hold the Semiannual House Session in Puerto Rico, where the scientific programs are to be held.

After debate, this motion was lost.

1969 AUDIT REPORT

Karl F. Mech, MD, Treasurer, presented the Auditor's statement for the year 1969. There being no objection, the auditor's statement was approved.

INFORMATION 1969 COMMITTEE REPORTS

The following 1969 Committee Reports were distributed in writing for the information of the meeting and an opportunity was afforded at this time to raise any questions.

Report of the Delegates to the American Medical Association—Robert L. Campbell, MD, J. Sheldon Eastland, MD, Russell S. Fisher, MD, December 1969 Clinical Meeting
Executive Director—Mr. John Sargeant
Library and History Committee and Finney Fund Committee—Paul F. Guerin, MD, and D. C. W. Finney, MD
Curator—Edwin David Weinberg, MD
Medical Annals—Leslie E. Daugherty, MD
Committee on Program and Arrangements—DeWitt E. DeLawter, MD
Committee on Contractual Arrangements—J. Howard Franz, MD, *Chairman*
Editorial Board, *Maryland State Medical Journal*—C. Thomas Flotte, MD
Committee on Emotional Health—Exall L. Kimbro, MD
Finance Committee—Karl F. Mech, MD
Maryland Medical Service, Board of Trustees—J. Sheldon Eastland, MD, *Chairman*
Med-Chi Insurance Trust—Paul F. Guerin, MD
Medical Emergency Disaster Service Committee—No committee appointed 1969/70
Committee on Postgraduate Education, Preventive Medicine and Public Health—John Whitridge, MD
Membership Committee—No committee appointed 1969/70—Committee abolished September 5, 1969
Public Relations Committee—Richard A. Young, MD
Mediation Committee—Lewis P. Gundry, MD
Secretary—William A. Pillsbury, MD

Policy and Planning Committee—Arthur T. Keefe, Jr., MD

Woman's Auxiliary to the Medical and Chirurgical Faculty—Mrs. Wallace H. Sadowsky

SPECIAL COMMITTEE ON MEDIC NETWORK

Thaddeus E. Prout, MD, on behalf of the Special Committee on the MEDIC Network, offered the following motion for consideration of the House which, after discussion, was adopted as follows:

Resolved, That the MEDIC Network be and it hereby is, declared an integral part of the effort of the Faculty in continuing medical education; and

Resolved, That notice be given to all delegates at least 60 days before the annual session of the Faculty to be held in 1971 of a proposal to impose an assessment on all active members in the amount of $5 per year for an indefinite period under the provisions of the Bylaws of the Faculty in Article III, Section 6; and

Resolved, That a study be made to obtain additional financing from other sources which may be applied to the total effort of the Faculty in the field of continuing medical education.

HOSPITAL ASSESSMENT DEFEATED

Dr. Prout, on behalf of the Special Committee on the MEDIC Network, offered the following motion for consideration of the House which, after debate, was DEFEATED:

Resolved, That member MEDIC Hospitals be assessed by a modest annual charge, based on bed capacity, as follows:

NUMBER OF BEDS	ANNUAL ASSESSMENT
Less than—99	$ 50
100-199	100
200-299	200
300-399	300
400-499	400
500 plus	500

SUBCOMMITTEE NAME CHANGE

Dr. Prout offered, on behalf of the Subcommittee, that the MEDIC Subcommittee name be changed to Subcommittee on Continuing Medical Education. This being an administrative matter, the House endorsed this proposal.

REFERENCE COMMITTEE REPORT RESOLUTION 1S/70 WITHDRAWN

Dr. Leighton, on behalf of the Reference Committee, requested permission for the Baltimore County Medical Association to withdraw Resolution 1S/70. There being no objection, the resolution was withdrawn.

RESOLUTION 2S/70 ADOPTED

Dr. Leighton, on behalf of the Reference Committee, moved the adoption of Resolution 2S/70 which, after debate, was adopted as follows:

Subject: Instructing the Professional Medical Services Committee to Establish Valid Data on a Minimum Three-Year Basis Concerning Current Charges for Physicians' Services Based on Usual, Customary and Reasonable Fees

Whereas, It is the established policy of the Medical and Chirurgical Faculty of the State of Maryland that reimbursement to physicians be on the basis of Usual, Customary and Reasonable fees, and

Whereas, This policy is frustrated by the unavailability of accurate information regarding such fees to third party agents, such as insurance carriers, federal and state government reimbursement parties, and

Whereas, These organizations will continue to use outdated fee schedules and other inaccurate and inadequate data unless the medical profession can supply them with valid data for physicians' services; now, therefore, be it

Resolved, That the House of Delegates instruct the Professional Medical Services Committee to establish valid data concerning current charges for physicians' services based on Usual, Customary and Reasonable fees charged private patients throughout the State of Maryland; and be it further

Resolved, That this Committee be required to review, revise and present to the Society such data at intervals not to exceed every three years.

RESOLUTION 3S/70 REFERRED TO LEGISLATIVE COMMITTEE

Dr. Leighton, on behalf of the Reference Committee, moved that Resolution 3S/70 be referred to the Legislative Committee, and, after debate, it was so referred:

Subject: Investigation and Possible Action Regarding Legislation to Assess Nonmembers of Professional Organizations Payment for Services Provided by Professional Organizations

Whereas, Part of the responsibilities of the Medical and Chirurgical Faculty of Maryland is disciplining all physicians in Maryland; handling of complaints against physicians; determining the propriety of fees charged by physicians; determining ethical policies to be followed by physicians; determining the adequacy of quantity and quality of care provided by physicians; conducting studies affecting the health of the people of Maryland, such as drug abuse, multiphasic screening, preschool hearing and vision testing, immunization projects; developing codes of cooperation with allied and related professional groups; and developing legislative activities related to medicine and health; and

Whereas, These responsibilities also apply to other professional associations such as the Maryland State Dental Association, the Maryland State Pharmaceutical Association, the Maryland State Nurses Association, the Maryland Licensed Practical Nurses Association, the Maryland State Bar Association, to mention only a few; and

Whereas, The provision of these services and activities, which indirectly benefit the public, should not be borne solely by those professionals who hold membership in the Professional Organizations providing these services; now, therefore, be it

Resolved, That the Legislative Committee of the Medical and Chirurgical Faculty of the State of Maryland

contact those professional groups involved to ascertain their interest in developing legislation that would require the appropriate professional licensing boards to collect from nonmember professionals sums to cover the discharge of these responsibilities in lieu of membership dues paid to the professional organization involved; and be it further

Resolved, That the Legislative Committee, if it ascertains that cooperation is forthcoming, draft suitable legislation to accomplish this purpose, with 50% of the receipts to be paid to the state professional association of the discipline involved and the balance paid to the local association where the professional concerned maintains his office or in which he practices, after suitable deduction of administrative expenses involved in such collection activities.

PRESS RELEASE ON ALLEGED MEDICAID SURPLUS

Manning W. Alden, MD, Council Chairman, offered the following motion to the House which, after discussion, was adopted as follows:

That the House of Delegates authorize a press release to educate the public with respect to the doctor's role in the existence of any surplus that may exist in the Medicaid program.

ANNOUNCEMENTS

Several announcements were made by various House members and the President.

There being no further business, the House adjourned *sine die* at 11:30 AM.

WILLIAM A. PILLSBURY, MD, SECRETARY

REPORTS

To The House of Delegates, Semiannual Meeting, Friday, September 11, 1970

PRELIMINARY REPORT OF AD HOC COMMITTEE TO INVESTIGATE ALL FACETS OF MEDIC

Mr. President and Members of the House of Delegates:

An initial meeting of this Ad Hoc Committee was held on Wednesday, June 24, 1970. At this meeting, the charge to the Committee, which reads

> "that the President of the Faculty appoint an Ad Hoc Committee to investigate all facets of the MEDIC Network and render a report to the House of Delegates at the 1970 Semiannual Meeting"

was considered. As appointed by the Faculty President, three of the Committee members were pro MEDIC and three against.

Two questions were posed to the Committee: (1) Is the MEDIC network of sufficient value to continue it? (2) If so, where should financial support be obtained?

Following the posing of these two questions it was concluded that MEDIC should be continued, improved in any way possible, and the number of replays increased. The Committee considered alternative methods of financial support. In other areas of the country where similar programs are in operation, assessments are made on participating hospitals and in other areas it is financed through the Regional Medical Program. It was noted that the MEDIC Network is used by hospitals for emergency as well as regular meetings, by Civil Defense, the School Health Council, etc. It was felt the hospitals would receive more benefit from the network if it were used by nurses and other paramedical groups.

It was also concluded that the network must be operated on a more permanent basis than currently, which is from year to year.

The following recommendation is, therefore, made to the House of Delegates:

That the members of the Ad Hoc Committee, present at the meeting on June 24, 1970, constituting a majority, are unanimously in favor of continuing the MEDIC Network; that the network is considered an integral part of the Faculty's effort in continuing medical education; that there be an annual assessment on active Faculty members, placed on the dues bill, for continuing medical education, including MEDIC as well as other educational programs of the Faculty (an assessment of $5 per year per active member of the Faculty would adequately support MEDIC); and that this assessment need not preclude attempts to obtain financial support from other sources, which can be applied to the total effort of continuing medical education.

A more detailed report will be submitted by August 15, 1970, after further figures have been obtained and recommendations for obtaining the necessary financing established.

Respectfully submitted,

JOHN WHITRIDGE, JR., MD, *Chairman*

COPY

REGIONAL MEDICAL PROGRAM FOR MARYLAND

Heart Disease-Cancer-Stroke

July 6, 1970

Frederick J. Heldrich, Jr., MD
Medical Subcommittee
Medical and Chirurgical Faculty
State Department of Health
301 West Preston Street
Baltimore, Maryland 21201

Dear Fred:

In a letter to you dated April 10, 1970, Dr. Peeples attached a copy of a letter sent to all of the 38 participating institutions in MEDIC and indicated that he would apprise you of forthcoming results.

As of July 1, 1970, we have had only 16 replies. The consensus is that attendance by physicians at MEDIC has been disappointingly poor. Some attributed this to the inconvenient hour that the program is presented. Most of the replies stated that the subject matter was good and that the physicians who attended found it scientific, informative, and up-to-date. Several hospitals commented that these presentations are being profitably used in graduate nurse teaching.

A general feeling is that, in a hospital, a Director of Medical Education or someone in a similar role must give continuous imaginative attention to MEDIC type programs to make them successful. Some expressed the opinion that the funds being used for MEDIC may be more effectively used in live television transmission or TV taping for distribution throughout the counties.

I regret that we were unable to get a greater response to our inquiry. However, I believe that the information we did receive represents a cross section of the views of most institutions to the MEDIC program.

Sincerely,

(SGD) ED

Edward Davens, MD
Coordinator

FINAL REPORT OF AD HOC COMMITTEE TO INVESTIGATE ALL FACETS OF MEDIC

AUGUST 15, 1970

Mr. President and Members of the House of Delegates:

As set forth in the preliminary report of this Committee on July 1, 1970, the following recommendation was made regarding the continuation of the MEDIC Network:

That the members of the Ad Hoc Committee, present at the meeting on June 24, 1970, constituting a majority, are unanimously in favor of continuing the MEDIC Network; that the network is considered an integral part of the Faculty's effort in continuing medical education; that there be an annual assessment on active Faculty members, placed on the dues bill, for continuing medical education, including MEDIC as well as other educational programs of the Faculty (an assessment of $5 per year per active member of the Faculty would adequately support MEDIC); and that this assessment need not preclude attempts to obtain financial support from other sources, which can be applied to the total effort on continuing medical education.

MEDIC has been funded by the Faculty through May 1971 and plans for the programs have been completed. It is the consensus of the Committee that MEDIC is one of the best efforts the Faculty has made in the area of continuing medical education and that it deserves Faculty support both philosophically and financially. It is felt that MEDIC is most successful in those hospitals where a physician has demonstrated his personal interest and has done his best to make it possible for local physicians to participate.

A second recommendation is made by this Committee:

That member MEDIC hospitals be assessed a modest annual charge based on bed capacity.

This recommendation was made by physicians who come from MEDIC hospitals. A suggested assessment that will apply to each MEDIC hospital is attached. The formula used to establish this assessment would be applied to any hospital joining at any time. The Faculty would continue to fund that portion of the MEDIC expense that is not covered by the proposed assessment. This assessment would be in addition to the cost for equipment rental which is presently paid by each member hospital.

The Preliminary Report of July 1, 1970, includes MEDIC attendance figures and MEDIC expense. Attached to the current report is a summary of the votes of the member hospitals regarding the assessment to be paid by hospitals in the MEDIC Network.

As a result of this study, the following resolutions are submitted for action by the House of Delegates:

1. **Resolved, That the MEDIC Network be, and it hereby is, declared an integral part of the effort of the Faculty in continuing medical education; and**

   Resolved, That notice be given to all Delegates at least sixty days before the Annual session of the Faculty to be held in 1971 of a proposal to impose an assessment on all active members in the amount of $5.00 per year for an indefinite period under the provisions of the Bylaws of the Faculty in Article III, Section 6; and

   Resolved, That a study be made to obtain additional financing from other sources which may be applied to the total effort of the Faculty in the field of continuing medical education.

2. **Resolved, That member MEDIC hospitals be assessed by a modest annual charge, based on bed capacity, as follows:**

NUMBER OF BEDS	ANNUAL ASSESSMENT
Less than 99	$50
100-199	100
200-299	200
300-399	300
400-499	400
500 plus	500

Respectfully submitted,

JOHN WHITRIDGE, JR., MD, *Chairman*
*ROBERT T. ADKINS, MD
D. THOMAS CRAWFORD, MD
ROBERT W. FARR, MD
JOHN C. HYLE, MD
THADDEUS E. PROUT, MD
R. LANE WROTH, MD

** Abstained from voting on this report as was unable to attend committee meeting due to illness.*

SUMMARY OF VOTES REGARDING MEDIC FROM MEMBER HOSPITALS*

ANNUAL ASSESSMENT

HOSPITAL	NUMBER OF BEDS	ANNUAL ASSESSMENT	FOR	AGAINST

31. Union Memorial	414	400	x	
32. Veterans Administration-Loch Raven	291	200		
33. Washington County	371	300		

** Replies have not been received from several MEDIC Representatives due to lack of time. It is expected this summary will be completed by the meeting of the House of Delegates in September.*
*** This affirmative vote is made only if a single assessment is made; eg, either assess the individual physician through the Med-Chi or assess the participating hospital, but not both.*

REFERENCE COMMITTEE

Mr. President and Members of the House of Delegates:

The Reference Committee met on Thursday, July 30, 1970, at 8 AM in the Faculty building to discuss the three resolutions introduced for consideration by the House of Delegates.

As is customary, all members of the Faculty were notified by postal card on July 22 of the resolutions to be considered. All Delegates and Component Society officers received complete copies of the resolutions mailed under date of July 23.

In accordance with Robert's Rules of Order (Revised), the Reference Committee's motions will be submitted on the resolution itself and the action taken will be on the resolution itself and not on the report.

Resolution 1S/70 was withdrawn by the Baltimore County Medical Association and, therefore, no action is required on this resolution.

Resolution 2S/70

Submitted on: July 16, 1970

Introduced by: Professional Medical Services Committee

Subject: Instructing the Professional Medical Services Committee to Establish Valid Data on a Minimum Three-Year Basis Concerning Current Charges for Physicians' Services Based on Usual, Customary and Reasonable Fees

Whereas, It is the established policy of the Medical and Chirurgical Faculty of the State of Maryland that reimbursement to physicians be on the basis of Usual, Customary and Reasonable fees, and

Whereas, This policy is frustrated by the unavailability of accurate information regarding such fees to third party agents, such as insurance carriers, federal and state government reimbursement parties, and

Whereas, These organizations will continue to use outdated fee schedules and other inaccurate and inadequate data unless the medical profession can supply them with valid data for physicians' services; now, therefore, be it

Resolved, That the House of Delegates instruct the Professional Medical Services Committee to establish valid data concerning current charges for physicians' services based on Usual, Customary and Reasonable fees charged private patients throughout the State of Maryland; and be it further

Resolved, That this Committee be required to review, revise and present to the Society such data at intervals not to exceed every three years.

Faculty policy was established by the House of Delegates at the Semiannual Session in 1965 and at the Semiannual Session in 1966. In four different resolutions adopted by the House of Delegates, it went on record as favoring payment to physicians for professional services on the basis of "Usual, Customary and Reasonable Fees," (for hospitalized medical care patients; Workmen's Compensation cases; all recipients of services under Medicaid; and also urging Blue Shield to establish a new plan to provide for payment of fees on this basis, with this new plan supplementing "to the greatest extent possible" all other plans with fixed fee schedules).

The sponsors of this resolution have emphasized that this resolution does not alter or modify Faculty policy as outlined above.

As is indicated in the Whereas portion of this resolution, third party payors have considerable difficulty in determining what a physician's Usual, Customary and Reasonable fee is. As a result, there is a tendency to use outdated schedules referring to them as "the latest information available".

This subject was discussed on a national level at the AMA House of Delegates session in June, in Chicago. At that time, the AMA House adopted a resolution that contained the following information:

Resolved, That state medical associations be urged to establish bureaus or departments of economic research, development and planning to study, develop and disseminate data concerning the economic aspects of medical practice . . .

It is to be emphasized that the collection of "data" by the Professional Medical Services Committee would not constitute a "fee schedule," and that every effort would be made to emphasize and reemphasize that physicians should charge and be paid on the basis of their "Usual, Customary and Reasonable" fee.

Passage of this resolution merely implies the collecting of data concerning "Usual, Customary and Reasonable Fees" as of this time. With this understanding, the Reference Committee *recommends that Resolution 2S/70 be adopted.*

Resolution 3S/70

Submitted on: July 17, 1970

Introduced by: Wicomico County Medical Society

Subject: Investigation and Possible Action Regarding Legislation to Assess Nonmembers of Professional Organizations Payment For Services Provided by Professional Organizations

Whereas, Part of the responsibilities of the Medical and Chirurgical Faculty of Maryland is disciplining all physicians in Maryland; handling of complaints against physicians; determining the propriety of fees charged by physicians; determining ethical policies to be followed by physicians; determining the adequacy of quantity and quality of care provided by physicians; conducting studies affecting the health of the people of Maryland, such as drug abuse, multiphasic screening, preschool hearing and vision testing, immunization projects; developing codes of cooperation with allied and related professional groups; and developing legislative activities related to medicine and health; and

Whereas, These responsibilities also apply to other professional associations such as the Maryland State Dental Association; the Maryland State Pharmaceutical Association; the Maryland State Nurses Association; the Maryland Licensed Practical Nurses Association; the Maryland State Bar Association, to mention only a few; and

Whereas, The provision of these services and activities, which indirectly benefit the public, should not be borne solely by those professionals who hold membership in the Professional Organizations providing these services; now, therefore, be it

Resolved, That the Legislative Committee of the Medical and Chirurgical Faculty of the State of Maryland contact those professional groups involved to ascertain their interest in developing legislation that would require the appropriate professional licensing boards to collect from nonmember professionals sums to cover the discharge of these responsibilities in lieu of membership dues paid to the professional organization involved; and be it further

Resolved, That the Legislative Committee, if it ascertains that cooperation is forthcoming, draft suitable legislation to accomplish this purpose, with 50% of the receipts to be paid to the state professional association of the discipline involved and the balance paid to the local association where the professional concerned maintains his office or in which he practices, after suitable deduction of administrative expenses involved in such collection activities.

This resolution includes a partial listing of those services and activities of the Faculty from which all physicians in the State of Maryland benefit. While the wording may be difficult to understand, it does nothing more than to instruct the Legislative Committee of the Faculty to consult with other professional groups (Dental Association, Nurses Association, Pharmaceutical Association and other health or health-related professionals) to ascertain their feelings in this regard.

If such groups are in accord with this principle, it would be explored further with the licensure boards concerned, as well as with the Secretary of Health and Mental Hygiene, under whose jurisdiction all such licensure boards function.

If accord is gained after these consultations, the Legislative Committee would then develop legislation that would accomplish these objectives. Presumably, such other professional groups would support such legislation if their governing bodies approved of the principle.

The Reference Committee concurs in the exploration of this proposal, though it is obvious that voluntary broad membership participation or even compulsory Med-Chi membership would be preferable and easier to enforce than compulsory billing of nonmembers.

Any policy decision would have to be approved by either the Council or the House of Delegates when that stage of the discussion is reached. The Reference Committee, therefore, recommends that Resolution 3S/70 be referred to the Legislative Committee for a study of this and alternate approaches to this problem.

The Reference Committee would again like to make a plea to individual members of the Faculty to attend the open hearings on resolutions and to express their viewpoints. The custom in the past has been that only a small percentage of the total membership is on hand to hear the discussion that takes place. It would be of great assistance to the committee to hear as many views as possible on resolutions that involve Faculty policy.

Respectfully submitted,

HERBERT H. LEIGHTON, MD, Oakland, *Chairman*

MARVIN I. MONES, MD, Silver Spring
WILLIAM H. MOSBERG, MD, Baltimore
RAYMOND M. YOW, MD, Salisbury

Semiannual Meeting—1970

Left: At the podium, Faculty President Dr. Henry A. Briele conducts the business session of the Semiannual Meeting held on Friday, September 11 in Hershey, Pennsylvania. Faculty VIPs also participating were (from left): John Sargeant, Executive Director; Dr. William A. Pillsbury, Secretary; and William J. Evans, Parliamentarian.

Right: No kidding! Golf can be hard work. Relaxing between rounds of the Faculty's golf tournament are (from left): Dr. U. G. Bourne, Jr., and Dr. Louis E. Harmon.

Left: It was easy to forget business and concentrate on pleasure at Saturday evening's cocktail party. Dr. Karl F. Mech (second from left) and Mrs. Mech (seated) seem to be enjoying the conversation and festivities as Mrs. Genevieve Ritchie of the Faculty staff looks on. Behind Dr. Mech are Dr. Archie Cohen and Dr. Joseph Taler.

your medical faculty at work

by John Sargeant

Executive Director

The Executive Committee met on Thursday, October 29, 1970, and took the following actions:

1. Approved the minutes of the House of Delegates session held in Hershey, Pa., Friday, September 11, 1970.
2. Authorized appointment of William A. Pillsbury, MD, Timonium, to be the Faculty representative on the Maryland Hospital Education and Research Foundation.
3. Authorized the Executive Director to further explore with the Maryland Chapter of the American Academy of Pediatrics the possibility of providing administrative and financial services for that organization on a cost basis. A report will be made to the Executive Committee on this matter.
4. Received word that a problem between the Judiciary and one of the Faculty's components was resolved satisfactorily.
5. Designated various nominees to Maryland Hospital Service, Inc. (Blue Cross) for appointment to Physician's Review Committees, to replace members whose terms are expiring. The lists from which the nominees were selected had been solicited from medical staffs at all general hospitals in the state.
6. Took formal action authorizing sale by auction of duplicate copies of books and out-of-scope copies of books from the library holdings (does not apply to rare books). This had been discussed and approved at previous Council sessions, but no formal motion had been adopted.
7. Agreed to defer legal action in connection with the use of the term "Chiropractic Physician" until this matter could be further explored.
8. Referred the recommendation from the "Blue Ribbon Committee" named by the Secretary of Health and Mental Hygiene in connection with the Salmonella outbreak in Baltimore, to the Nursing Home Liaison Subcommittee for implementation and report to the Council.
9. Referred to the same subcommittee for investigation and report a question posed by the statewide Health Facilities Association of Maryland about the use of medical directors to provide medical care, along with other duties, to all nursing-home patients.
10. Declined to provide the detailed information requested by the Finance Committe of Baltimore City Medical Society about the charges made by the Faculty for services provided that group. The details requested included: salaries of Faculty employees and a percentage of the time that such employees devoted to Baltimore City Medical Society activity. The same data that has been provided in recent years will be provided this year, with an assessment as to how these costs were reached.

The Council met on Thursday, October 29, 1970, in special session to discuss various federal and state activities in connection with delivery of health care services. Invited to join this special session was the entire Board of the Maryland Blue Shield Plan, Inc. After a lengthy discussion and debate, the Council took the following actions:

1. Directed the staff to prepare and to mail to all members a summary of the material already received by Council members, together with an explanatory covering letter.
2. Authorized the appointment of a Special Committee to investigate and to make recommendations to the Council for mechanisms which would best serve the public in the delivery of health care.

Health Outlay: $300 A Person

Total health spending will average out to more than $300 for every man, woman, and child in the United States in 1970.

And hospital services will account for almost one third of the outlay.

An analysis of Consumer Price Index tables indicates that hospital costs have climbed faster than any other health service since the end of World War II.

Health care services, in turn, have increased faster than any other type of personal expense.

From 1945 through the first half of 1970, the cost of medical care has tripled, according to CPI data.

At the same time, the cost of all items in the market basket has doubled.

The nation's health care bill for the fiscal year ending June 1969 according to government figures totaled $60.3 billion, up from $48.2 billion just two years earlier.

The major increase was a 34% rise in hospital costs for the two years.

Last year these costs were up 13%. During the first half of 1970 they were up 6.2% and they had climbed nearly 700% since 1945.

Over the same 25 years, total insurance benefits from health insurance companies increased over 2,400%.

There are also more Americans receiving insurance benefits.

Last year 175 million persons were covered by private hospital expense insurance.

Back in 1945, some 32 million Americans had this form of protection, with 11 million covered by insurance companies.

Two reasons for the increase in insurance protection are the more frequent utilization being made of hospitals, and rising hospital costs.

While inpatient costs now average $81.66 a day, American Hospital Association studies point to this increase to $119.50 by 1973; and other estimates show that this will go much higher.

These increases have been attributed mainly to the higher salaries now being paid hospital employees as well as the increase in the number of these employees to care for an individual patient.

Other factors are the introduction of expensive equipment, and Medicare, which increased the demand for hospital beds, according to medical authorities.

tuberculosis

Skeletal Tuberculosis

Skeletal tuberculosis occurs in approximately 1% of all patients with tuberculosis. Even if diagnosis is made after skeletal TB is moderately advanced, good joint function oftentimes can be expected from drug treatment alone.

Like pulmonary tuberculosis, skeletal tuberculosis has markedly decreased. In fact, it has become so uncommon that clinicians have become unaccustomed to think about it, even in patients with a previous history of tuberculosis or exposure to it.

Oftentimes diagnosis is delayed for many years. This is unfortunate since it leads to intractable bone and joint damage resulting in a marked loss of function. Therefore, a review of skeletal tuberculosis appears to be in order.

Due largely to modern effective chemotherapy, skeletal TB has been practically eliminated in children. So the discussion which follows deals primarily with adult disease.

Causes of Skeletal TB

Most skeletal TB probably results from the blood transport of tubercle bacilli from a focus of tuberculosis in an area or organ such as the lung, early in the course of the initial infection. In some instances though, the bacilli may be transported through the lymphatic system. One study suggests that most Pott's disease results from lymphatic dissemination of bacilli to the spine. Skeletal involvement may be the only manifestation of systemic disease.

The basic lesion is almost always a combination of osteomyelitis and arthritis. Invasion of the joint space may be either direct, via the blood stream or indirect from lesions in epiphyseal bone eroding into the joint space.

Initially, an inflammatory reaction develops in the synovium which, in turn, provokes granulation tissue. An effusion develops in which fibrin may precipitate, forming the so-called rice bodies. This pannus of granulation tissue then begins to erode and destroy cartilage and eventually cancellous bone. Ultimately, it leads to progressive demineralization and caseation necrosis.

TB infection does not produce the proteolytic enzymes which destroy cartilage so extensively and so abruptly in pyogenic arthritis. In skeletal TB, cartilage is destroyed peripherally at first. Joint space may be preserved for a considerable time.

In far advanced disease, para-osseous abscesses (the so-called cold abscesses) usually develop eventually, and these abscesses involve joint tissue.

Ultimately, erosion with sinus-tract formation may develop.

The healing process in bone and lung are similar. Fibrous tissue forms; usually it causes fibrous and possibly osseous ankylosis.

Clinical Aspects

In adults, skeletal TB usually occurs in the joints most subject to trauma. One study of 230 cases

Paul T. Davidson, MD, Isaac Horowitz, MD, The American Journal of Medicine, *January 1970, Vol. 48.*

revealed that over 70% of the lesions occurred in the spinal column, hip, knee, or sacroiliac joints.

However, any bone in the body can be involved. For instance, TB of the ribs occurs in approximately 5% of all cases of bone and joint TB. In fact, it is the most common inflammatory process involving the ribs. In older patients it may be seen in unusual locations, such as sternoclavicular joints.

Any monoarticular arthritis, particularly with a destructive lesion, is suspect. Patients with multiple osteolytic lesions should always alert the clinician to possible multiple skeletal involvement or even widespread dissemination of TB in the bone.

Early Diagnosis

If skeletal TB is properly diagnosed and treated early enough, good joint function will result.

TB should always be considered in patients who complain of skeletal pain, as pain is the most common complaint. There may be joint swelling and limitation of motion. A "cold" abscess is another clue.

The purified protein derivative tuberculin skin test remains one of the most valuable diagnostic tools and should be a routine part of the evaluation of any destructive arthritis or bone lesion, particularly spinal or monoarticular arthritis.

Recovery of bacilli in smear and culture of joint fluid or "cold" abscess aspirates confirms diagnosis. If necessary, a biopsy specimen of tissue should be obtained for examination and culture, preferably at an early date. A pathology report of granulation tissue with caseation necrosis compatible with tuberculosis is sufficient indication to begin therapy.

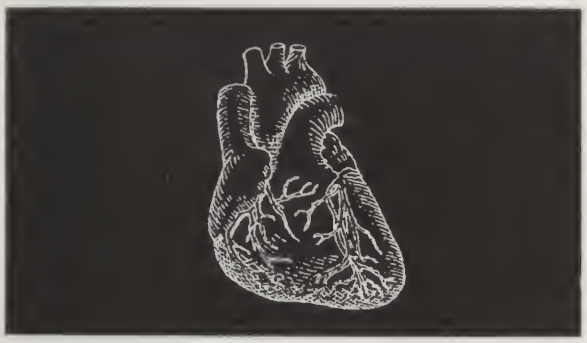
Good roentgenograms are invaluable in helping to establish the diagnosis and to follow the progress of the disease during therapy. Early lesions are easily missed since soft tissue swelling may be the only abnormality. Later, in long bones, small localized areas of osteoporosis occur subchondrally, often associated with a surrounding ring of sclerosis. Subsequently, varying degrees of cortical and cartilage destruction take place which in months or years can result in complete destruction of the joint space.

Changes in the spine are first noted as a slight narrowing of the intervertebral space. Later the adjacent vertebral bodies develop destructive lesions with eventual collapse and formation of varying degrees of scoliosis and kyphosis often referred to as gibbus formation.

The differential diagnosis of skeletal tuberculosis should include sarcoid arthritis and pyogenic arthritis caused by bacteria and fungi.

The so-called atypical mycobacterial infections have been implicated as causes of bone and joint disease in a number of reports. Clinically there is little to differentiate this infection from TB, although a case simulating rheumatoid arthritis has been reported. Atypical mycobacteria are frequently resistant to the usual antituberculosis drugs.

Neoplasms in bone can mimic tuberculosis. Often such lesions are metastatic from tumors of the breast, lung, or prostate. Finding the primary lesion helps to establish the etiology of the bone lesion. Since bone lesions caused by tumor are much more common than tuberculosis, the latter diagnosis is more likely to be overlooked, resulting in unnecessary delay and risk in treating a completely curable disease.



Treatment

Since the advent of chemotherapy, surgery is much less often necessary and much safer than before. Skeletal tuberculosis of the spine when associated with considerable destruction warrants surgical fusion because of the chance of collapse with paraplegia.

With effective chemotherapy, however, surgical intervention is only rarely indicated and should be reserved to prevent deformity, to improve function, and to arrest disease that has not responded to drugs. If diagnosis is made when the disease is in its early stages or even when it is moderately advanced, good joint function can be expected to result with drug treatment alone.

The Work Evaluation Unit of the Heart Association of Maryland

DONALD H. DEMBO, MD
Chief Cardiologist and Head
Division of Cardiology
Maryland General Hospital
Baltimore

More than ten million Americans suffer with serious diseases of the heart and circulation. Twenty percent of all patients with coronary heart disease are in the 30 to 44 year age group, the prime of life. The standard recommendation to patients with heart disease has often been to discontinue working entirely, or to limit activity to light work. These vague work prescriptions have been impractical and unrealistic since industry is seldom able to assign employment without specific guide lines.

Long medical experience has shown that work appropriate to cardiac status results in less harm than inactivity itself which may be psychologically and socioeconomically disastrous for the family and for the community. The worker's fear of the effect his work will have on his heart, and his employer's fear that he will not be able to do his work satisfactorily, has resulted in needless unemployment of the cardiac patient. The American Heart Association recognized these problems and was instrumental in establishing Work Evaluation Units sponsored by local heart associations, community agencies, industries, and hospitals.

The Maryland Cardiac Work Evaluation Unit supported by the Heart Association and the State of Maryland was organized in 1954. Patients with real or suspected heart disease are accepted for evaluation on referral from any private, industrial, or clinic physician. The unit, composed of a cardiologist, a vocational counselor, a medical-social worker, and a psychiatrist, evaluate each patient in an effort to correlate his current physical and emotional capacity with his previous or potential job. A history and physical examination, electrocardiogram, chest fluoroscopy and, where indicated, an electrocardiographic monitored test of exercise tolerance, are recorded.

On the basis of objective data, a functional and therapeutic classification for physical activity is formulated. The energy costs of various activities including self-care, housework, and industrial jobs have been estimated. In an evaluation of the patient by the vocational counselor, consideration is given to average requirements of the patient's usual occupation including peak loads as well as physical requirements of any potential employment.

The socioeconomic burden of the patient's illness and the home environment are examined. The patient's motivation and personality structure are considered. Finally, his physical and emotional capacity is weighed against his work requirements and an

employment prescription is forwarded to the referring physician for appropriate action. Since the Work Evaluation Unit of the Heart Association of Maryland was established, more than 3,300 patients have been evaluated. When seen, 70% were unemployed, although it was felt that almost 90% could return to gainful employment, two thirds to their old jobs. Those who were unable to return to their previous employment were assisted in making use of facilities of other agencies in the community such as Vocational Rehabilitation for appropriate guidance and for assistance in finding gainful employment. Continuous follow-up through mailed questionnaires has afforded a long-term evaluation of the unit's effort. In five-year follow-ups, more than 50% of the patients considered employable were working regularly. Especially significant has been the finding that only 15% were not working as a direct result of their heart disease.

Among patients seen at the work evaluation unit were patients with many different skills and work backgrounds, including: unskilled workers, managerial and executive personnel, farm workers, housewives, and professional people. The employment capacity of such individuals has been studied by the United States Department of Labor; 1,840 cardiac workers were compared with 3,055 workers without heart disease in the same types of jobs in more than 50 industries. There was only a small difference in job performance between the two groups. In fact, the cardiac worker was slightly more productive than the noncardiac workers.

Data from other work classification units are similar, providing evidence that a high proportion of patients with cardiovascular disease can and should work. When carefully evaluated and advised as to what they can or cannot do, they make good employees. The World Health Organization Expert Committee on Rehabilitation of Patients with Cardiovascular Diseases stressed that medical experience has shown that work appropriate to the cardiac status results in less harm than the psychological and socioeconomic consequences that inactivity itself provides for the family and the community as a whole.

With medical advances, an increasing number of heart patients will be salvaged with a larger group of such individuals seeking employment. The knowledge and experience gained through work evaluation units have made a significant contribution to the education of physicians, workers, and their employers, and has helped influence standard practices of insurance carriers. Most important, these units have expanded the cardiac's capacity for leading a useful life, maintaining self-esteem and making a significant contribution to society.

Patterns of Medical Care in a Municipal Hospital

The medical care of the chronically ill patient is a major challenge to our present medical system. Institutional care is expensive, disorganized, and haphazard. There exists confusion as to goals, often accompanied by disinterest and callousness amongst the staff caring for such patients. This is a report on the results of a comprehensive approach to such patients, emphasizing the use of complete diagnostic methods and rehabilitation in its widest sense.

Fifty-one preplanned chronic admissions entered the Baltimore City Hospitals between July 4 and December 4, 1968. As a group, these patients were believed to need prolonged hospitalization but were not emergency admissions. Each patient had a Maryland State Chronic Hospital Application form filled out prior to admission. A decision was always made concerning whether the patient really needed hospitalization or whether other arrangements could be made which would meet his needs.

All admitted patients were given a complete diagnostic evaluation on the acute medical wards. This was done in the belief that a complete understanding of the patient's disease, response to therapy, social background, and evaluation in the Department of Physical Medicine and Rehabilitation, would lead to more appropriate long-term placement and better overall rehabilitation. I saw each patient shortly after admission, after which he was placed into one of three groups, based on the expectation of what could be done for him. **Group 1** consisted of patients with manifest neoplasms who were admitted for terminal care. There were 11 patients in this group. **Group 2** consisted of patients admitted for rehabilitation and recovery with the expectation that they could be discharged back to the facility or home in which they were, prior to admission. This group consisted of seven patients. One of these patients had an asymptomatic carcinoma of the prostate, but because he was not admitted primarily for this purpose, he is not included in Group 1.

Group 3 consisted of 33 patients with multiple diseases. They were admitted with the expectation that they would require permanent long-term care in some type of institution. Many of these patients were elderly, with complications of diabetes mellitus and atherosclerosis. Many had chronic brain syndrome associated with head injuries and strokes.

There were approximately equal numbers of men and women in each group and equal numbers of white and Negro patients. There was no significant difference as to the number of drugs the patients were on at admission (2 ± 1). About three consultations were called in for each patient in each group.

There were no significant differences in age. The patients with neoplasms tended to have had more previous hospital admissions and a shorter duration of illness than those in the other two groups. Those admitted for rehabilitation or recovery (Group 2) tended to have been sick for a longer period of time. The majority of the patients with neoplasms (Group 1) were transferred from another hospital to the Baltimore City Hospitals. The other two groups, however, received an equal number of patients from the home and as transfers from hospitals. The initial Activities of Daily Living scores were about similar in Groups 1 and 3 but significantly higher in Group 2. This finding was also true of the Mental Status Check List score (see Table 1).

The duration of time for initial workup and treatment in the acute medical service was similar in all three groups. Following the initial diagnostic

workup, completion of consultations, and establishment of a coordinated program for each patient, the patients were transferred to the chronic hospital (D Building).

Table 1: Comparison of Certain Features of Three Groups of Preplanned Chronic Admissions

Patients in Group 1 had the shortest stay in the D Building, terminating in death in all except one patient who was discharged to his home. Patients in Group 2 spent about twice the time in the D Building as those in Group 1. There was only one death. One was discharged to a nursing home, four returned home, and one was transferred to a Veteran's Administration Hospital.

Group 3 was made up of patients for whom expert diagnostic facilities, availability of all therapeutic modalities, and prolonged hospital care resulted in little more than usually keeping the patient alive. These patients had very prolonged hospitalizations, five still being inmates of D Building after two years. Nearly one half died and four went to nursing homes. It is significant, however, that 27% were discharged to their homes despite all of the medical and social factors making such a disposition unlikely.

What Was Accomplished By Hospitalization?

Under ordinary circumstances, many of these patients might have been sent directly to nursing homes from other hospitals or from their own homes. The question arises then as to what facilities available in a hospital but not in a nursing home were of benefit.

Group 1: The admitting diagnosis of all these patients with neoplasms was confirmed in every case except one. In that case, the patient was found to have an adenocarcinoma of the kidney rather than a carcinoma of the prostate at post-mortem examination. One patient with proven carcinoma of the breast and atherosclerotic heart disease was found to have hypothyroidism and was treated for this. Two patients developed high calcium levels (one had carcinoma of the lung and the other had carcinoma of the pancreas). Both were expertly treated. This resulted in some prolongation of life but questionable overall benefit to the patient. One patient had brittle diabetes mellitus regulated adequately and because of this was able to be discharged to a nursing home. Post-mortem examination was performed in four of these patients and revealed unexpected pulmonary emboli in one patient and radiation pneumonia in another.

Thus, these patients were given expert and sophisticated medical care with possible prolongation of life. Diagnoses were confirmed and complications were treated.

Group 2: These patients received a number of benefits from hospitalization. Three patients experienced sufficient improvement in Activities of Daily Living to be able to take care of themselves at home. One patient had skin grafting; another had brittle diabetes mellitus that was adequately regulated, but he eventually died. One patient with cirrhosis of the liver suffered a gastrointestinal hemorrhage and was treated for it but eventually was transferred to a Veteran's Administration Hospital. Another patient suffered a fracture of the hip in the hospital.

These patients in Group 2 received a variety of specialized procedures such as plastic surgery, physical therapy, and medical treatment of a sophisticated sort, not generally available in a nursing home. The eventual return of four of these patients to their own homes seems a well justified use of hospitalization.

Group 3: This group was twice the size of the other two groups combined and consisted of patients with multiple diseases. These patients had very low ADL and MSCL scores. They remained in the hospital for prolonged periods and eventually had a high mortality rate. Since none of these patients at initial evaluation were expected to profit from hospitalization, it is important to identify the nine patients who actually were discharged back to their homes.

Case Patients

1. A 53-year-old man with a four-year history of myocardiopathy, congestive heart failure, and bilateral cerebral vascular accidents was received in transfer from another hospital. With removal of a gastric tube and mobilization, the patient was able to return home. He was then treated in the cardiac clinic for two years after discharge.

2. A 57-year-old man was admitted with a diagnosis of Parkinson's disease of a year's duration. Examination in the hospital showed that he had an

undiagnosed cerebral vascular accident. He was mobilized and his ADL score rose from 85 to 100. He was discharged home after only five months in the hospital.

3. A 60-year-old woman with a history of hypertension, diabetes, atherosclerotic heart disease, and congestive heart failure suffered a right hemipareses one year prior to admission. Over a two-month period it was possible to mobilize her. Her ADL score went from 45 to 100 and she was discharged and sent home.

4. A 58-year-old woman with a long history of diabetes mellitus and arteriosclerotic heart disease suffered a cerebral vascular accident a year before admission. Under appropriate physical therapy, her ADL score increased from 0 to 30 and she was discharged home but eventually had to be readmitted.

5. A 17-year-old girl with a severe head injury of 32 days' duration was transferred from a local hospital with a tracheostomy and a gastric tube. She had not been mobilized at the previous hospital, but shortly after admission to the Baltimore City Hospitals, the tracheostomy was closed. The tube was then removed and the patient rather rapidly threw off her lethargy and depression. She reached an ADL score of 100 and was discharged home.

6. A 40-year-old man suffered a severe brain injury with multiple fractures three months prior to transfer from another hospital to the Baltimore City Hospitals. His ADL admission score was 50. A Foley catheter was removed. He was then mobilized. His ADL score went up to 90, and it was possible to discharge him after five months.

7. A 62-year-old woman was admitted to the Baltimore City Hospitals three months after having suffered a subdural hematoma which was appropriately treated at another hospital. Under physical therapy she developed full independence and was discharged to her home nine months after admission.

8. A 41-year-old man suffered a bullet wound of the left carotid with a right hemiplegia, 35 days prior to transfer to the Baltimore City Hospitals. His ADL admission score was 80 and he was under physical therapy. Soon, however, he attained a score of 100. He was unable to speak but could follow directions. He remained in the hospital for seven months.

9. A 76-year-old woman suffered a right hemiplegia two months prior to admission. She also had atherosclerotic heart disease. On admission her ADL score was 65. However, under physical therapy she rapidly reached a score of 100, which was sufficient to allow self-care in her home and discharge.

The majority of patients in this group were expected to do poorly. However, with intensive mobilization of available facilities in the hospital, it was possible to discharge nine of them to their own homes.

Evaluation

There is little need to emphasize the increasing number of elderly patients with multiple diseases coming to hospitals for medical care today. One reason for the increased number is that children are no longer so willing to care for their sick parents at home. Government programs are tending to pay for hospitalization for some of these patients, thus further removing responsibility from the family. Hospitals are no longer feared as much as formerly, and there is an expectation that modern methods of treatment are effective. Perhaps the greatest cause of the increased number of elderly sick, however, is that patients who formerly would have died are living longer and developing multiple diseases. Powerful drugs and new techniques allow survival of patients who formerly would have died. The result is that many of these elderly patients, in addition to multiple organic diseases, are also depressed, passive, and overwhelmed by social and financial problems.

Our approach to this problem at the Baltimore City Hospitals has been:

1. Each patient must have a comprehensive (medical, mental, psychological, social, and financial) evaluation.

2. These evaluations must be coordinated into a specific plan for each patient.

3. Elaborate diagnostic procedures are required and indicated as necessary for comprehensive planning.

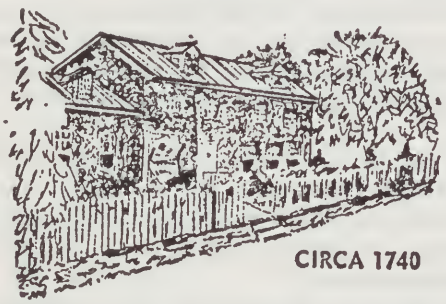
4. The justification for this approach is not to be based on the discovery of a large number of potentially treatable diseases, but rather based on the identification of an occasional unexpected finding which may be of help to these patients.

5. The goal of this approach is to cure, if that is possible. More often than not, the goal will be to modify the disease, emotional state, social, or financial problems. Often, the goal is to teach the patient or the family to live more happily with its problems.

6. Individual patient benefit is the underlying goal. Family, hospital, house staff, and community benefit are also important ingredients, however, in outlining an individual program for each patient.

Summary

Fifty-one preplanned chronic admissions were admitted to Baltimore City Hospitals in the fall of 1968. These were patients selected from the community by hospitals, families, and local physicians with the thought that they needed prolonged care in an institution. Many of these patients under ordinary circumstances might have been admitted directly to a nursing home.



Under the program at the Baltimore City Hos-

pitals, each one of these patients was admitted, and carefully evaluated from the diagnostic, therapeutic, rehabilitation, social, and financial viewpoint. An individual specific program was outlined with a goal of making the patient as independent as possible. The patients were divided into three groups. Group 1 consisted of patients with terminal cancer. The major problem was to administer terminal care with as little anxiety and as much support of the patient as possible.

The remaining patients were divided into two groups. Group 2 patients (seven) were believed to have potential for improvement under the program outlined. Group 3 patients (33) were thought to require prolonged institutional care with little potential for improvement. The prediction of potential improvement in Group 2 was fulfilled. In Group 3, nine patients improved unexpectedly. This proved that rehabilitation potential was not always recognized at the initial evaluation.

Programs which are free to take advantage of the patient's improvement under treatment are, therefore, necessary to make certain that optimal benefit accrues to all patients. It is only by recognizing this fact that a rehabilitation program such as I have described can ever really succeed.

Clinics Open, Aides Meet and Medical Workers Join Staff

In response to community requests for prenatal, well-baby, and family planning services, the Baltimore City Health Department has opened a new clinic center at 4200 Edmondson Avenue. The center is unique in that it is housed in a medical building where several private physicians are also available to assist patients with special problems not covered in the clinics. It also incorporates many of the community's suggestions about the types of clinics that should be available.

Another innovation is the assignment of a clinic manager and a health aide on a full-time basis. Thus, someone is always available to help patients when clinics are not in session. A full team of physicians, public health nurses, and health aides from the Western Health District will be present for clinic sessions only.

The present schedule of clinics is: Monday, prenatal clinic; Tuesday, well-baby clinic; Wednesday, family planning clinic; and Thursday, well-baby clinic. All clinics will be open for service on their individual days at 8:30 AM. They will remain open until all patients are served. This schedule will be modified if the community shows a need for more clinic time.

Tuberculosis Aides Receive National Recognition

A small symposium on the use of paramedical personnel in tuberculosis control was recently presented by the Tuberculosis Division of the Baltimore City Health Department in Atlanta, Georgia. The symposium was part of the meeting of tuberculosis controllers called by the National Center for Disease Control on October 5 and 6, 1970.

Allan S. Moodie, MD, presented the main paper while Mrs. Selma Wilson and Mrs. Frances Taylor, health aides, presented supporting papers describing their functions in working in the field and with industrial tuberculin testing, respectively.

At this meeting too, Phyllis Q. Edwards, MD, Chief of the Tuberculosis Branch of the Center for Disease Control, cited the Baltimore City Health Department for its practical and economical control program which is now meeting with considerable success.

Medical Social Workers Appointed

Three medical social workers have been appointed to the staff of the Baltimore Maternity Center, 211 W. Lombard Street. They are: Mrs. Jimmie Poindexter, formerly of Prairie View, Texas; Miss Theresa Chan, Baltimore; and Mrs. Barbara Shulman, also of Baltimore.

Under the direction of Miss Carolyn White, chief of the social services unit, the new staff members will assist maternity patients who have no family physician with home and maternity problems related to their pregnancies.

Mrs. Poindexter, a graduate of Prairie View College, holds the master of social work degree from Howard University and has been employed in social work in both Texas and Baltimore. For the past four years she has been a social worker in the Baltimore City Department of Education. Mrs. Poindexter will serve as Medical-Social Work Supervisor.

Miss Chan, previously a social-work assistant at the University of Maryland Hospital, attended Western High School and is a 1970 graduate of the University of Maryland.

Mrs. Shulman attended Forest Park High School and received her bachelor's degree from the University of Maryland also. For the past year, she has been teaching in Clarksville, Maryland.

Gone with the wind

The gas/acid group of disorders

"The two most common complaints referable to the upper gastrointestinal tract for which patients seek medical relief are hyperacidity and 'gas.' The two often occur together."*

Frees captured gas...neutralizes free acid

SILAIN-GEL Tablets and Liquid are separate formulas designed to provide equivalent dual-action symptomatic relief. Both dosage forms contain simethicone which effectively frees trapped gas, enabling the patient to eliminate it. Magnesium hydroxide in both assures a rapid rise in pH for prompt relief of hyperacidity. The special co-dried aluminum hydroxide/magnesium carbonate gel in the tablets assures the same rapid and uniform reaction rate as the liquid. Thus, both medications achieve prompt and prolonged neutralization of free acid *plus* prompt relief from the pain and pressure of trapped gas.

Always in good taste

The pleasant, distinctive flavor of SILAIN-GEL, as well as its non-constipating feature, make it a therapy your patients can live with—in comfort and without complaint.

Select the form of SILAIN-GEL you want to provide symptomatic relief in: gastric ulcer • duodenal ulcer • heartburn • gastric hyperacidity • gastritis • dyspepsia

when the patient prefers the convenience of a tablet, select

Silain-Gel® Tablets:

when the patient prefers a liquid, select

Silain-Gel® Liquid

Also available for the patient who needs an antifrothicant/antiflatulent agent only: **Silain®** (simethicone) Tablets

*Slanger, A.: Med. Times *94*:150 (Feb.) 1966.

Announcing the "Antgasid"

Silain-Gel®

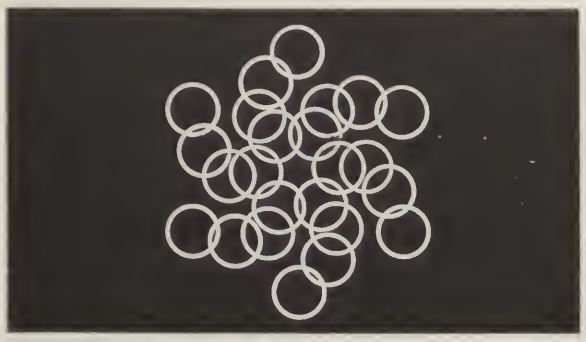
Tablets: simethicone plus aluminum hydroxide/magnesium carbonate co-dried gel and magnesium hydroxide

Liquid: simethicone plus aluminum hydroxide and magnesium hydroxide

one dose does both: frees captured gas...neutralizes free acid

A·H·ROBINS A.H. Robins Company, Richmond, Virginia 23220

The Doctor



One of the doctor's most important roles is in education.

For his patients, the physician provides the facts, supplies the rationale, triggers the action for life-saving health practices. To his students, he passes on his knowledge and the benefits of his clinical experience. With his colleagues, he shares new information and concepts.

Assisting the doctor in his teaching role is a major function of our professional education program. Through medical conferences, films, exhibits, pamphlets, monographs and other publications, we provide him with the most important and current information on cancer.

If, as Henry Brooks Adams speculated, "A teacher affects eternity; he can never tell where his influence stops", the outlook is optimistic.

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Treatment of Acute Intoxication: (Part) I

NELSON J. BRADLEY, MD
Medical Director
Alcoholism Rehabilitation Center
Lutheran General Hospital
Park Ridge, Illinois

The acute alcoholic is frequently either not accepted by general hospitals or, if accepted, is automatically admitted. Obviously, all general hospitals should be accepting acute alcoholics, but not all alcoholics should be automatically admitted. A differential diagnosis is called for in each case. The decision of whether or not to admit an alcoholic should be based on the old standby of a good history and a physical.

The alcoholic patient is classically a poor reporter and, because of preoccupation with his presenting problem and the loss of control of his drinking and its consequences, he is irritated by the need for a detailed inquiry into his general physical condition. The person presenting the alcoholic is just as frequently a poor reporter. In spite of the fact that this person may even be married to the alcoholic, the spouse frequently has not been in close contact. Often the spouse, too, has not been aware of or concerned about other possible medical problems. When the primary concern is to unload the alcoholic, reporting will be even more inadequate. An attempt at a careful history is therefore fundamental in the management of the acute phase, and a carefully recorded history is a very good precaution.

The degree of intoxication seems to be the main criteria as to whether or not an alcoholic should be admitted. Frequently, the main objection to admitting an alcoholic to a hospital is that he is noisy, recalcitrant, hostile, aggressive, abusive, and overactive. If he is capable of that kind of behavior, ie, if he is conscious enough to argue about his legal rights and is in enough control of the motor portion of his central nervous system to physically resist, it is usually fairly safe to refuse admission. In fact, to refuse him admission very often results in his becoming much more pliable and cooperative. The physician should concentrate concern on reassuring the distracted spouse or friend and return the responsibility to them.

Sometimes the accompanying person drops the alcoholic at the hospital and runs. A proper procedure then is to get the correct address from the alcoholic, call a taxi and return him to this address. If it is the local police who leave him, make certain that the recalcitrant alcoholic is returned to their care. The responsible emergency ward will obviously not allow the intoxicated person to leave in his own automobile. The hospital very frequently is not equipped to stop the alcoholic, but it can be responsible enough to call the police and inform them that an intoxicated person has just left the premises and intends to drive. It is effective to send an alcoholic home with a sedative and to give him another dose to take with him. This obviously can only be done with a responsible person present, such as the spouse or friend.

The alcoholic person who is not overactive and abusive, but is in some stage of somnambulance or coma, presents a different problem. Here we really have a problem of differential diagnosis. This is why I offered the precautionary note on the ac-

Reprint permission granted by Medical Ecology and Clinical Research, *Vol. 3, No. 1, Spring 1970. Copyright 1970, Lutheran General Hospital, Park Ridge, Illinois, U.S.A.*

curacy of alcoholic histories. The procedures are no different than the procedures for any coma. We have a patient who: 1) has all the complications of acute ethynol poisoning; 2) is very susceptible to trauma of every conceivable kind; 3) is much more susceptible to acute infection involving any system of the body; and 4) is quite likely to have such medical emergencies as anuria, pancreatitis, or ruptured peptic ulcer—all of which are difficult enough in themselves to diagnosis in the early stages. There is a much higher incidence of the chronic dehabilitating diseases. Diabetes and malnutrition are fairly common. Most frequently, the alcoholic has chronically neglected all aspects of his physical health.

The diagnosis of alcohol coma should be arrived at through the routine set-up for any patient who comes in with some degree of coma. Alcohol blood levels, barbiturate levels, sodium potassium levels, and magnesium levels are a part of any good routine.

The diagnosis of delirium tremens is standard. The practice of sedating a person who is obviously in delirium tremens and then phoning to find a hospital which has an admitting policy that accepts DT's is inexcusable. This is a medical emergency which is somewhere between 15% and 30% fatal unless it is properly managed. The promiscuous use of sedation to control the patient just for the ambulance ride or, more frequently, for the family car ride to the more enlightened hospital, vastly complicates the management of the patient.

The "saturated alcoholic" is an obviously intoxicated person who is not belligerent or aggressive and has not lost any consciousness. He looks very ill. Fearful and alert, extremely tense and anxious, he is usually most cooperative. When the emergency room calls a physician and describes a condition as being neither belligerently out of hand, nor in coma, there is a tendency for the physician to order sedation and have him sent home. Frequently the emergency room will call the physician again within the hour. For some reason, even unknown to themselves, they have not sent this alcoholic home. They have been impressed by the fact that this person looks very "sick". The tense desperateness of this type of alcoholic is obvious as he tries to minimize every kind of sensory stimulus, both external and internal. In such a condition he usually gives a very accurate history, but speaks only in monosyllables.

Delirium tremens may not be imminent, but the person should be treated the same as if he had DT's. He very often will respond remarkably to this routine, and then the question arises if all these heroics were necessary. If you neglect giving him the full treatment, you very often will have a difficult case of delirium tremens on your hands. These patients frequently have a leukopenia and a very slightly elevated temperature and a hyperreflexia as immediate presenting symptoms.

Control is Necessary

When the belligerent, recalcitrant alcoholic is admitted, control is necessary because such a patient is impossible to manage on the ward. Rather generous doses of intramuscular sedation is a fairly safe way to accomplish control. Actually, sedation is indicated for almost every alcoholic admission because of the degree of anxiety.

As long as the patient is anxious, it will be difficult to restore his various functions to their natural state.

Extreme anxiety, which is crippling to even the nonintoxicated alcoholic, results in an abnormal physiological situation. There is no system in the body that is not involved in this phenomenon. The state of uncontrolled anxiety is really very similar to Dr. Selyes' second stage of the stress reaction, and this eventually leads to the exhaustion of the various systems involved.

The best sedative and tranquilizer for the acutely intoxicated and also the very anxious alcoholic, however, is a well qualified and experienced staff. The situation is then met with a sense of sureness, calmness, firmness, and a neutral attitude. When you have this, the simple tranquilizer routines, and sometimes even the vitamin routines used by certain alcoholic treatment centers, have produced results not duplicated by inexperienced hospitals. Glowing results are very often attributed to various drug effects by hospitals which have a policy of accepting alcoholics as sick people. These results may well be attributed to a trained, knowledgeable, and empathetic staff.

There is no room for coddling an alcoholic admission. He reacts just as poorly to this as he does to a hostile, angry staff environment. He particularly reacts to inefficiency and deceit. The wife, for instance, may want the patient told that he is being admitted to a medical floor, when actually it will be a psychiatric floor. It is disastrous for the staff to go along with this type of deceit. Trying to cajole or threaten an alcoholic will hinder more than help. Usually when you just tell an alcoholic the way things are, he very often complies. Resistance immediately appears at the slightest indication of hostility or the slightest indication of fear or weakness. He is unable to respond any differently to these inconsistencies. Very often the alcoholic has enough alcohol in his system that an atmosphere of reassurance and confidence is enough to put him to sleep.

The goal is a state of natural sleep. This article will not dwell on the complications of over-sedating. They are exactly the same as that of a prolonged anesthetic. Under-sedating brings on all the complications any prolonged stress situation creates in our physiology.

Actually, the time of day of admission is im-

portant in the combination of sedation and tranquilization. The intoxicated alcoholic should be restored as quickly as possible to the natural rhythm of an ordinary day. During the first day in the hospital, when the effort is to reassure the patient that he is being withdrawn without any unnecessary suffering, he should have enough tranquilizer so that he can lie down and sleep, yet be alert enough to eat his three meals.

A careful routine would give a patient an intermuscular prochlorperazine (*Compazine*) 1 or 2 cc depending on his size, two hours prior to lunch and possibly prior to the first supper. This settles the butterflies well enough to allow him to eat and retain his first lunch and his first supper. The first night in the hospital the patient should sleep soundly. This means using one of the barbiturates (preferably *Amytal* or *Tuinal*) in large enough doses. These should be repeated, if necessary, and given either orally or intermuscularly as indicated.

The choice of tranquilizers is academic, and the reader can refer to the various literature on the subject. Most tranquilizers have an adequate variety of doses plus an intermuscular dose. Some physicians prefer to stay with those tranquilizers that do have the intermuscular as well as the oral. Mixing tranquilizers is not particularly contraindicated. The long-acting spansules have some considerable merit in the later days of hospitalization.

Problems with Tranquilizers

One of the objections to the use of tranquilizers is the complication of lowering the convulsive threshold. Convulsions have always been a complication of alcohol withdrawal. The fact that alcoholics have quite likely used tranquilizers prior to admission and that we are using them in the management of the acute intoxication in the hospital, has tremendously increased the problem of alcohol convulsions. This is a grand mal, extremely unpredictable convulsion, which makes these people very injury prone. They never seem to have the warning of the epileptic grand mal. It certainly appears that the claims of less convulsions with chlordiaze poxide hydrochloride (*Librium* and *Valium*) are valid. Convulsions seem most prevalent with the use of promazine (*Sparine*) although this is an extremely effective tranquilizer for withdrawing the alcoholic.

The phenothiazines are not an effective anticonvulsant. They are more prone to create another complication—hypotension. Hypotension is relatively rare with oral medication and can be further prevented by bed rest after an IM dose. The contraindication of the phenothiazines in a person who obviously has a damaged liver has not proved to be valid. As a matter of fact, the decompensating liver seems to handle phenothiazines better than either *Librium* or *Valium*. The alcoholic with the decompensating liver occasionally cannot handle even the smallest doses of *Librium* and becomes completely ataxic and drowsy. Reducing the dose does not seem to be the answer. The drug has to be completely withdrawn.

The problem of contraindication because of the addictive proneness of the alcoholic to tranquilizers is an interesting but overrated phenomenon. It does, however, call for some consideration. There are vast differences in the so-called addicting potential of the various tranquilizers. The only tranquilizer that has become an abuse problem is meprobamate. There seems to be enough indication to preclude their use in the management of alcoholism in either the acute or chronic state. Certainly the phenothiazines are the safest on this score. What appears to be the habituating factor in the tranquilizers is in direct correlation with their ability to reduce anxiety. The meprobamates, which seem to be the most effective in the immediate reduction of anxiety, are also the most habituating. Their closest competition in anxiety reduction—*Librium* and *Valium*—also have some problems with habituation. The less dramatic anxiety reducers, such as the various phenothiazines, rarely become an habituation problem with the alcoholic patient. The old rule of never giving the patient the drug he asks for certainly applies in all these cases.

The alcoholic, however, should not be threatened with withdrawal. The acutely intoxicated alcoholic, which an experienced staff is managing in a general hospital, can be withdrawn from all tranquilizers in most cases within four to five days. The best routine is to use the same tranquilizer with the same frequency but in decreasing doses so that you can decrease the dosages to 25, 10, and 5; or 10, 5, and 2. The patient will be down to 0 within these four to five days. This routine does not seem to threaten the alcoholic's dependent needs nor does it arouse fears of rejection. If it is not effective, it implies that you do not have the kind of personnel working with the alcoholic who are capable of reducing anxiety by their management and relationship to the patient. Perhaps you have an alcoholic who has a problem with other addictions than just ethynol. He may have anxieties beyond the anxieties that are usually part of the alcohol addiction and his withdrawal symptoms.

The saturated alcoholic is not going to respond to a simple q.i.d. tranquilizer but will most likely need the addition of intermuscular medication to give him rest. Sound sleep is essential. The early breakfast, the perfunctory efficiency of the lab technicians, physicians' rounds, and other hospital services and routines are not nearly as valuable as a state of natural sleep in the first 24 hours.

The most controversial sedatives are the barbiturates. The primary reasons for choosing barbi-

turates is that they are the most effective sedative. They are also the most flexible in length of action and can be given orally, IM, or IV. Since sodium amytal is not too effective an anticonvulsant, it would seem best to use phenobarbital or intermuscular sodium luminal. There are several programs which report successful use of these drugs. These drugs, however, are difficult to control because of long and sometimes delayed action. They also have a depressant effect on the alcoholic. These are strong contraindications for their use. Secobarbital (*Seconal*) and pentobarbital (*Nembutal*) are precluded because alcoholics are extremely susceptible to habituation and eventually addiction to these drugs.

Library Co-Sponsors Meeting

The Washington, D.C. Area Medical Library Group, organized in 1952, met in Baltimore this year for its 1970 session. It was sponsored jointly by the Health Sciences Library, the University of Maryland, and the Medical and Chirurgical Faculty of Maryland Library. Instrumental in originally organizing this regional association were Miss Estelle Brodman, Mrs. Ida Marian Robinson, and Mr. Scott Adams. Since 1952, the medical library community has grown considerably and this year has added the North Carolina medical librarians to its group.

Mrs. Robinson, Librarian Emeritus, Health Sciences Library, University of Maryland, made the introductory remarks. Miss Myrl Ebert, Librarian, Health Sciences Library, North Carolina Memorial Hospital, University of North Carolina, Chapel Hill, North Carolina, spoke on behalf of the North Carolina delegation. An invitation was extended for the next meeting (October 1971) by Mrs. Erika Love, Librarian, Wake Forest University Library, Bowman Gray School of Medicine, to Winston-Salem, North Carolina.

Three outstanding speakers contributed to the varied program of the conference. Mrs. Mary M. Baxter, former Chief Programmer, SUNY (State University, New York) explained the Biomedical Communication Network in Upstate Medical Center, Syracuse, New York, and presented an enlightening account of the activities and status of the network.

The Multimedia, Self-Instruction Project of the School of Nursing, University of Maryland, was explained by Mrs. Ada M. Lindsey, Assistant Professor, University of Maryland School of Nursing. The original grant for this project was $700,000, with $160,000 a year provided for operation. The project is now 1½ years old. Units of actual nursing equipment are prepared for circulation to students as are supplementary teaching aids to be used in conjunction with tapes, slides, and movies.

Norman S. Stearns, MD, Executive Director, Postgraduate Medical Institute, West Newton, Massachusetts, gave an illustrated paper on his idea of the integrated health sciences core library for physicians, nurses, and allied health practitioners in community hospitals. Dr. Stearns views the library as a health sciences learning center and sees the role of the librarian in this setting mainly as an educator. Following his speech, a number of searching questions were asked and all librarians present, especially from community hospitals, must have left with a somewhat new outlook on their own library.

Anyone wishing copies of the list of publications on this subject, by Dr. Stearns and others, may secure copies by writing to the Medical and Chirurgical Faculty Library.

* * *

On January 21, 1971, at 2 PM, the Baltimore Hospital Librarians Association at Union Memorial Hospital will meet to discuss both the philosophical view of nursing libraries and the use of audiovisual media in small medical libraries.

A pilot issue of the *Bibliography of Medical Bibliographies* was distributed recently by the Health

Sciences Bibliographic Clearinghouse which was established as a part of the Reference Services Division, Reference Section, National Library of Medicine in 1969.

This is a pilot project which provides an index to both published and unpublished bibliographies in biomedicine. In the pilot issue, bibliographies from 1967 to date have been included, omitting regularly recurring bibliographies and review articles already indexed in the *Bibliography of Medical Reviews*. However, lengthy bibliographies from biomedical monographs are included if complete citations are given.

The complete citation is given first, listed alphanumerically, with a KWIC index by keyword following. However, an author index, which could be helpful, is lacking.

If you wish to receive a copy, write: Edith D. Blair, Project Officer, Health Sciences Bibliographic Clearinghouse, Reference Section, Reference Services Division, National Library of Medicine, Rockville Pike, Bethesda, Maryland 20014.

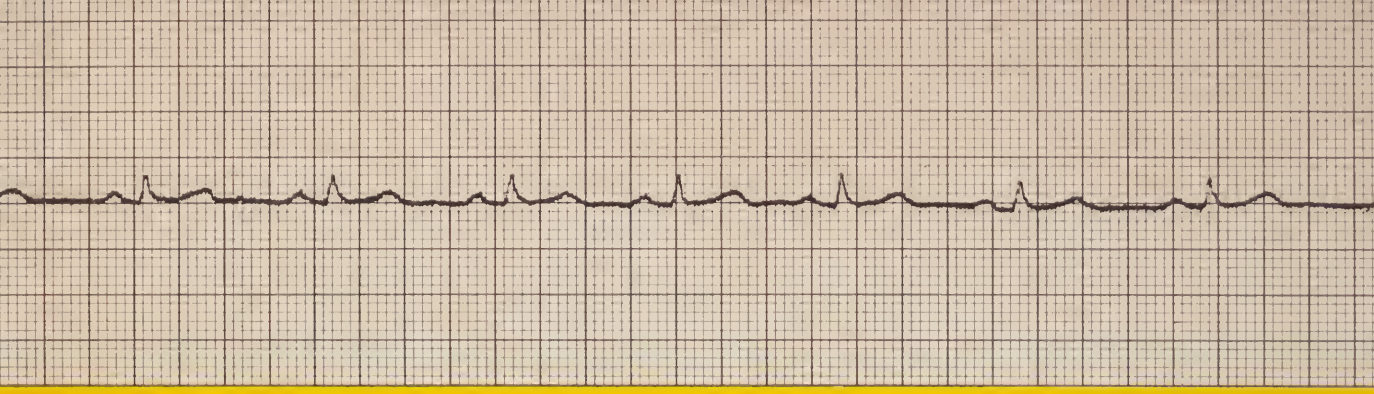
"I'm not ready to talk about estate planning"

You are approaching the peak of your career. Your income is growing and you have a savings program . . . but you simply don't have time to talk about estate planning. It seems so far off, so remote.

You should take time. You and your attorney should sit down with the specialists at Mercantile and plan your estate *now*. This will assure the administration of your estate in the way *you* want it done with maximum tax benefits and security.

After all, Mercantile has over 400 experienced people administering trusts, estates, and investment accounts with assets of approximately three billion dollars to give people like you peace of mind.



Take a few minutes and talk to Mercantile today . . . it's important.

Dick Flanigan is ready to talk to you and your attorney about estate planning.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.
